What's new in Exchange Server

8/3/2020 • 54 minutes to read • Edit Online

Exchange Server 2019 brings a new set of technologies, features, and services to Exchange Server, the messaging platform that provides email, scheduling, and tools for custom collaboration and messaging service applications. Its goal is to support people and organizations as their work habits evolve from a communication focus to a collaboration focus. At the same time, Exchange 2019 helps lower the total cost of ownership whether you deploy Exchange 2019 on-premises or provision your mailboxes in the cloud.

Choose the section below that matches the version of Exchange that you're upgrading from. If you want to know about features that have been removed or replaced in Exchange 2019, see What's discontinued in Exchange Server.

For more information about deploying Exchange 2019, see Planning and deployment for Exchange Server.

What's new when upgrading from Exchange 2016 to Exchange 2019?

Security

- **Windows Server Core support**: Running Exchange on a Windows deployment with less surface area means less attack surface area and fewer components to service.

- **Block external access to Exchange admin center (EAC) and the Exchange Management Shell**: You can use Client Access Rules to only allow administration of Exchange from the internal network instead of using complex network and firewall rules.

- **TLS 1.2 is the only version that's enabled by default**: Exchange Server 2019 includes important changes to improve the security of client and server connections. The default configuration for encryption will enable TLS 1.2 only and disable support for older algorithms (namely, DES, 3DES, RC2, RC4 and MD5). It will also configure elliptic curve key exchange algorithms with priority over non-elliptic curve algorithms. In Exchange Server 2016 and later, all cryptography settings are inherited from the configuration specified in the operating system. For additional information, see Exchange Server TLS Guidance.

Performance

- **Improved search infrastructure**: The completely rebuilt search infrastructure for cloud scale and reliability in Exchange Online is now available in Exchange 2019. This new search infrastructure allows for indexing of bigger files, simpler management, and better search performance.

- **Faster, more reliable failovers**: The changes to the search architecture result in significantly faster and more reliable failover over between servers.

- **Metacache database**: Improvements at the core of Exchange's database engine enable better overall performance and take advantage of the latest storage hardware, including larger disks and SSDs.

- **Modern hardware support**: Exchange now supports up to 256 GB of memory and 48 CPU cores.

- **Dynamic database cache**: The information store process employs dynamic memory cache allocation optimizing memory usage to active database usage.

Clients

- **Calendar - Do Not Forward**: This is similar to Information Rights Management (IRM) for calendar items without the IRM deployment requirements. Attendees can't forward the invitation to other people, and only the organizer can invite additional attendees.

- **Calendar - Better Out of Office**: Additional options when you won't be in the office. Key options include:

add an event to your calendar that shows you as Away/Out of Office, and a quick option to cancel/decline meetings that will happen while you're away.

- **Calendar - Remove-CalendarEvents cmdlet**: Enables administrators to cancel meetings that were organized by a user that has left the company. Previously, conference rooms or meeting attendees would have these defunct meetings permanently on their calendars.
- **Email address internationalization (EAI)**: Email addresses that contain non-English characters can now be routed and delivered natively.

What's new when upgrading from Exchange 2013 to Exchange 2019?

Exchange 2019 architecture

Today, CPU horsepower is significantly less expensive and is no longer a constraining factor. With that constraint lifted, the primary design goal for Exchange 2019 is for simplicity of scale, hardware utilization, and failure isolation. With Exchange 2019, we reduced the number of server roles to two: the Mailbox and Edge Transport server roles.

Unified Messaging (UM) has been removed from Exchange 2019. Other than that, the Mailbox server in Exchange 2019 includes all of the server components from the Exchange 2013 Mailbox and Client Access server roles:

- Client Access services provide authentication, limited redirection, and proxy services. Client Access services don't do any data rendering and offer all the usual client access protocols: HTTP, POP and IMAP, and SMTP.
- Mailbox services include all the traditional server components found in the Exchange 2013 Mailbox server role except Unified Messaging: the backend client access protocols, Transport service, and Mailbox databases. The Mailbox server handles all activity for the active mailboxes on that server.

The Edge Transport role is typically deployed in your perimeter network, outside your internal Active Directory forest, and is designed to minimize the attack surface of your Exchange deployment. By handling all Internet-facing mail flow, it also adds additional layers of message protection and security against viruses and spam, and can apply mail flow rules (also known as transport rules) to control message flow.

For more information about the Exchange 2019 architecture, see Exchange architecture.

Along with the new Mailbox role, Exchange 2019 now allows you to proxy traffic from Exchange 2013 Client Access servers to Exchange 2019 mailboxes. This new flexibility gives you more control in how you move to Exchange 2019 without having to worry about deploying enough front-end capacity to service new Exchange 2019 servers.

Clients

Outlook on the web (formerly known as Outlook Web App)

Outlook Web App is now known as Outlook on the web, which continues to let users access their Exchange mailbox from almost any web browser.

> **NOTE**
>
> Supported Web browsers for Outlook on the web in Exchange 2019 are Microsoft Edge, Internet Explorer 11, and the most recent versions of Mozilla Firefox, Google Chrome, and Apple Safari.

The former Outlook Web App user interface has been updated and optimized for tablets and smart phones, in addition to desktop and laptop computers. New Exchange 2019 features include:

- **Platform-specific experiences for phones** for both iOS and Android.
- **Premium Android experience** using Chrome on devices running Android version 4.2 or later.
- **Email improvements**, including a new single-line view of the Inbox with an optimized reading pane,

archiving, emojis, and the ability to undo mailbox actions like deleting a message or moving a message.

- **Contact linking** the ability for users to add contacts from their LinkedIn accounts.
- **Calendar** has an updated look and new features, including email reminders for Calendar events, ability to propose a new time in meeting invitations, improved search, and birthday calendars.
- **Search suggestions and refiners** for an improved search experience that helps users find the information they want, faster. Search suggestions try to anticipate what the user's looking for and returns results that might be what the user is looking for. Search refiners will help a user more easily find the information they're looking for by providing contextually-aware filters. Filters might include date ranges, related senders, and so on.
- **New themes** Thirteen new themes with graphic designs.
- **Options** for individual mailboxes have been overhauled.
- **Link preview** which enables users to paste a link into messages, and Outlook on the web automatically generates a rich preview to give recipients a peek into the contents of the destination. This works with video links as well.
- **Inline video** player saves the user time by keeping them in the context of their conversations. An inline preview of a video automatically appears after inserting a video URL.
- **Pins and Flags** which allow users to keep essential emails at the top of their inbox (Pins) and mark others for follow-up (Flags). Pins are now folder specific, great for anyone who uses folders to organize their email. Quickly find and manage flagged items with inbox filters or the new Task module, accessible from the app launcher.
- **Performance improvements** in a number of areas across Outlook on the web, including creating calendar events, composing, loading messages in the reading pane, popouts, search, startup, and switching folders.
- **New Outlook on the web action pane** that allows you to quickly click those actions you most commonly use such as New, Reply all, and Delete. A few new actions have been added as well including Archive, Sweep, and Undo.

MAPI over HTTP

MAPI over HTTP is now the default protocol that Outlook uses to communicate with Exchange. MAPI over HTTP improves the reliability and stability of the Outlook and Exchange connections by moving the transport layer to the industry-standard HTTP model. This allows a higher level of visibility of transport errors and enhanced recoverability. Additional functionality includes support for an explicit pause-and-resume function, which enables supported clients to change networks or resume from hibernation while maintaining the same server context.

Note: MAPI over HTTP isn't enabled in organizations where the following conditions are both true:

- You're installing Exchange 2019 in an organization that already has Exchange 2013 servers installed.
- MAPI over HTTP wasn't enabled in Exchange 2013.

While MAPI over HTTP is now the default communication protocol between Outlook and Exchange, clients that don't support it will fall back to Outlook Anywhere (RPC over HTTP).

For more information, see MAPI over HTTP in Exchange Server.

Document collaboration

Exchange 2019, along with SharePoint Server 2019, enables Outlook on the web users to link to and share documents that are stored in OneDrive for Business in an on-premises SharePoint server instead of attaching files to messages. Users in an on-premises environment can collaborate on files in the same manner.

For more information about SharePoint Server 2019, see New and improved features in SharePoint Server 2019.

When an Exchange 2019 user receives a Word, Excel, or PowerPoint file in an email attachment, and the file is stored in OneDrive for Business or on-premises SharePoint, the user will now have the option of viewing and editing that file in Outlook on the web alongside the message. To do this, you'll need a separate computer in your on-premises organization that's running Office Online Server. For more information, see Install Office Online Server in an Exchange organization.

Exchange 2019 also brings the following improvements to document collaboration:

- Saving files to OneDrive for Business.
- Uploading a file to OneDrive for Business.
- Most Recently Used lists populated with both local and online files.

Microsoft 365 or Office 365 hybrid

The Hybrid Configuration Wizard (HCW) that was included with Exchange 2013 is moving to become a cloud-based application. When you choose to configure a hybrid deployment in Exchange 2019, you'll be prompted to download and install the wizard as a small app. The wizard will function the same in previous versions of Exchange, with a few new benefits:

- The wizard can be updated quickly to support changes in the Microsoft 365 or Office 365 service.
- The wizard can be updated to account for issues detected when customers try to configure a hybrid deployment.
- Improved troubleshooting and diagnostics to help you resolve issues that you run into when running the wizard.
- The same wizard will be used by everyone configuring a hybrid deployment who's running Exchange 2013 or later.

In addition to Hybrid Configuration Wizard improvements, multi-forest hybrid deployments are being simplified with Azure Active Directory Connect (AADConnect). AADConnect introduces management agents that will make it significantly easier to synchronize multiple on-premises Active Directory forests with a single Microsoft 365 or Office 365 organization. For more information about AADConnect, see What is hybrid identity with Azure Active Directory?.

Exchange ActiveSync clients will be seamlessly redirected to Microsoft 365 or Office 365 when a user's mailbox is moved to Exchange Online. To support this, ActiveSync clients need to support HTTP 451 redirect. When a client is redirected, the profile on the device is updated with the URL of the Exchange Online service. This means the client will no longer attempt to contact the on-premises Exchange server when trying to find the mailbox.

Messaging policy and compliance

There are several new and updated message policy and compliance features in Exchange 2019.

Data loss prevention

To comply with business standards and industry regulations, organizations need to protect sensitive information and prevent its inadvertent disclosure. Examples of sensitive information that you might want to prevent from leaking outside your organization include credit card numbers, social security numbers, health records, or other personally identifiable information (PII). With a DLP policy and mail flow rules (also known as transport rules) in Exchange 2019, you can now identify, monitor, and protect 80 different types of sensitive information with new conditions and actions:

- With the new condition **Any attachment has these properties, including any of these words**, a mail flow rule can match messages where the specified property of the attached Office document contains specified words. This condition makes it easy to integrate your Exchange mail flow rules and DLP policies with SharePoint, Windows Server 2012 R2 File Classification Infrastructure (FCI), or a third-party classification system.

- With the new action **Notify the recipient with a message**, a mail flow rule can send a notification to the recipient with the text you specify. For example, you can inform the recipient that the message was rejected by a mail flow rule, or that it was marked as spam and will be delivered to their Junk Email folder.
- The action **Generate incident report and send it to** has been updated to enable the notification of multiple recipients by allowing a group address to be configured as the recipient.

To learn more about DLP, see Data loss prevention in Exchange Server.

In-place Archiving, retention, and eDiscovery

Exchange 2019 includes the following improvements to In-Place Archiving, retention, and eDiscovery to help your organization meet its compliance needs:

- **Public folder support for In-Place eDiscovery and In-Place Hold**: Exchange 2019 integrates public folders into the In-Place eDiscovery and Hold workflow. You can use In-Place eDiscovery to search public folders in your organization, and you can put an In-Place Hold on public folders. And similar to placing a mailbox on hold, you can place a query-based and a time-based hold on public folders. Currently, you can only search and place a hold on all public folders. In later releases, you'll be able to choose specific public folders to search and place on hold. For more information, see Search and place a hold on public folders using In-Place eDiscovery.
- **Compliance Search**: Compliance Search is a new eDiscovery search tool in Exchange 2019 with new and improved scaling and performance capabilities. You can use it to search very large numbers of mailboxes in a single search. In fact, there's no limit on the number of mailboxes that can be included in a single search, so you can search all mailboxes in your organization at once. There's also no limit on the number of searches that can run at the same time. For In-Place eDiscovery in Exchange 2019, the limits are the same as in Exchange 2013: you can search up to 10,000 mailboxes in a single search and your organization can run a maximum of two In-Place eDiscovery searches at the same time.

  In Exchange 2019, Compliance Search is only available by using the Exchange Management Shell. For information about using the Compliance Search cmdlets, see the following topics:

  - Get-ComplianceSearch
  - New-ComplianceSearch
  - Remove-ComplianceSearch
  - Set-ComplianceSearch
  - Start-ComplianceSearch
  - Stop-ComplianceSearch

  > **NOTE**
  >
  > To have access to the Compliance Search cmdlets, an administrator or eDiscovery manager must be assigned the Mailbox Search management role or be a member of the Discovery Management role group.

For more information, see Messaging policy and compliance in Exchange Server.

Improved performance and scalability

In Exchange 2019, the search architecture has been redesigned. Previously, search was a synchronous operation that was not very fault-tolerant. The new architecture is asynchronous and decentralized. It distributes the work across multiple servers and keeps retrying if any servers are too busy. This means that we can return results more reliability, and faster.

Another advantage of the new architecture is that search scalability is improved. The number of mailboxes you can search at once using the console has increased from 5k to 10k for both mailboxes and archive mailboxes, allowing you to search a total of 20k mailboxes at the same time.

Microsoft Exchange Server 2016 brings a new set of technologies, features, and services to Exchange Server, the messaging platform that provides email, scheduling, and tools for custom collaboration and messaging service applications. Its goal is to support people and organizations as their work habits evolve from a communication focus to a collaboration focus. At the same time, Exchange 2016 helps lower the total cost of ownership whether you deploy Exchange 2016 on-premises or provision your mailboxes in the cloud.

Choose the section below that matches the version of Exchange that you're upgrading from. If you want to know about features that have been removed or replaced in Exchange 2016, see What's discontinued in Exchange Server.

For more information about deploying Exchange 2016, see Planning and deployment.

What's new when updating from Exchange 2016 RTM to Exchange 2016 CU1?

When you update to Exchange 2016 Cumulative Update 1 (CU1) from Exchange 2016 RTM, you'll get the following new features:

- **SHA-2 compliant S/MIME in Outlook on the web**: We've updated the certificate that's used by the S/MIME control in Outlook on the web. The certificate is now SHA-2 compliant. Users who downloaded the control from Exchange 2016 RTM will need to download the control again after you install CU1.

- **Additional languages for Outlook on the web**: With CU1, we're adding 17 new languages to Outlook on the web.

- **Improved download package**: Exchange 2016 releases, starting with CU1, are now packaged as ISO files instead of a self-extracting EXE file. The ISO file can be mounted directly in Windows Server 2012 or later. If you need to install Exchange across a network, you can create a network share from the mounted ISO drive.

What's new when upgrading from Exchange 2013 to Exchange 2016 RTM?

Exchange 2016 architecture

Exchange 2016 architecture

Today, CPU horsepower is significantly less expensive and is no longer a constraining factor. With that constraint lifted, the primary design goal for Exchange 2016 is for simplicity of scale, hardware utilization, and failure isolation. With Exchange 2016, we reduced the number of server roles to two: the Mailbox and Edge Transport server roles.

The Mailbox server in Exchange 2016 includes all of the server components from the Exchange 2013 Mailbox and Client Access server roles:

- Client Access services provide authentication, limited redirection, and proxy services. Client Access services don't do any data rendering and offer all the usual client access protocols: HTTP, POP and IMAP, and SMTP.
- Mailbox services include all the traditional server components found in the Exchange 2013 Mailbox server role: the backend client access protocols, Transport service, Mailbox databases, and Unified Messaging. The Mailbox server handles all activity for the active mailboxes on that server.

The Edge Transport role is typically deployed in your perimeter network, outside your internal Active Directory forest, and is designed to minimize the attack surface of your Exchange deployment. By handling all Internet-facing mail flow, it also adds additional layers of message protection and security against viruses and spam, and can apply mail flow rules (also known as transport rules) to control message flow.

For more information about the Exchange 2016 architecture, see Exchange 2016 architecture.

Along with the new Mailbox role, Exchange 2016 now allows you to proxy traffic from Exchange 2013 Client Access servers to Exchange 2016 mailboxes. This new flexibility gives you more control in how you move to Exchange 2016 without having to worry about deploying enough front-end capacity to service new Exchange 2016 servers.

Clients

Outlook on the web (formerly Outlook Web App)

Outlook Web App is now known as Outlook on the web, which continues to let users access their Exchange mailbox from almost any web browser.

> **NOTE**
>
> Supported Web browsers for Outlook on the web in Exchange 2016 are Microsoft Edge, Internet Explorer 11, and the most recent versions of Mozilla Firefox, Google Chrome, and Apple Safari.

The former Outlook Web App user interface has been updated and optimized for tablets and smart phones, in addition to desktop and laptop computers. New Exchange 2016 features include:

- **Platform-specific experiences for phones** for both iOS and Android.
- **Premium Android experience** using Chrome on devices running Android version 4.2 or later.
- **Email improvements**, including a new single-line view of the Inbox with an optimized reading pane, archiving, emojis, and the ability to undo mailbox actions like deleting a message or moving a message.
- **Contact linking** the ability for users to add contacts from their LinkedIn accounts.
- **Calendar** has an updated look and new features, including email reminders for Calendar events, ability to propose a new time in meeting invitations, improved search, and birthday calendars.
- **Search suggestions and refiners** for an improved search experience that helps users find the information they want, faster. Search suggestions try to anticipate what the user's looking for and returns results that might be what the user is looking for. Search refiners will help a user more easily find the information they're looking for by providing contextually-aware filters. Filters might include date ranges, related senders, and so on.
- **New themes** Thirteen new themes with graphic designs.
- **Options** for individual mailboxes have been overhauled.
- **Link preview** which enables users to paste a link into messages, and Outlook on the web automatically generates a rich preview to give recipients a peek into the contents of the destination. This works with video

links as well.

- **Inline video** player saves the user time by keeping them in the context of their conversations. An inline preview of a video automatically appears after inserting a video URL.
- **Pins and Flags** which allow users to keep essential emails at the top of their inbox (Pins) and mark others for follow-up (Flags). Pins are now folder specific, great for anyone who uses folders to organize their email. Quickly find and manage flagged items with inbox filters or the new Task module, accessible from the app launcher.
- **Performance improvements** in a number of areas across Outlook on the web, including creating calendar events, composing, loading messages in the reading pane, popouts, search, startup, and switching folders.
- **New Outlook on the web action pane** that allows you to quickly click those actions you most commonly use such as New, Reply all, and Delete. A few new actions have been added as well including Archive, Sweep, and Undo.

MAPI over HTTP

MAPI over HTTP is now the default protocol that Outlook uses to communicate with Exchange. MAPI over HTTP improves the reliability and stability of the Outlook and Exchange connections by moving the transport layer to the industry-standard HTTP model. This allows a higher level of visibility of transport errors and enhanced recoverability. Additional functionality includes support for an explicit pause-and-resume function, which enables supported clients to change networks or resume from hibernation while maintaining the same server context.

Note: MAPI over HTTP isn't enabled in organizations where the following conditions are both true:

- You're installing Exchange 2016 in an organization that already has Exchange 2013 servers installed.
- MAPI over HTTP wasn't enabled in Exchange 2013.

While MAPI over HTTP is now the default communication protocol between Outlook and Exchange, clients that don't support it will fall back to Outlook Anywhere (RPC over HTTP).

For more information, see MAPI over HTTP in Exchange 2016.

Document collaboration

Exchange 2016, along with SharePoint Server 2016, enables Outlook on the web users to link to and share documents that are stored in OneDrive for Business in an on-premises SharePoint server instead of attaching files to messages. Users in an on-premises environment can collaborate on files in the same manner that's used in Microsoft 365 and Office 365.

For more information about SharePoint Server 2016, see New and improved features in SharePoint Server 2016.

When an Exchange 2016 user receives a Word, Excel, or PowerPoint file in an email attachment, and the file is stored in OneDrive for Business or on-premises SharePoint, the user will now have the option of viewing and editing that file in Outlook on the web alongside the message. To do this, you'll need a separate computer in your on-premises organization that's running Office Online Server. For more information, see Install Office Online Server in an Exchange 2016 organization.

Exchange 2016 also brings the following improvements to document collaboration:

- Saving files to OneDrive for Business.
- Uploading a file to OneDrive for Business.
- Most Recently Used lists populated with both local and online files.

Microsoft 365 or Office 365 hybrid

The Hybrid Configuration Wizard (HCW) that was included with Exchange 2013 is moving to become a cloud-based application. When you choose to configure a hybrid deployment in Exchange 2016, you'll be prompted to download and install the wizard as a small app. The wizard will function the same in previous versions of Exchange, with a few new benefits:

- The wizard can be updated quickly to support changes in the Microsoft 365 or Office 365 service.
- The wizard can be updated to account for issues detected when customers try to configure a hybrid deployment.
- Improved troubleshooting and diagnostics to help you resolve issues that you run into when running the wizard.
- The same wizard will be used by everyone configuring a hybrid deployment who's running Exchange 2013 or Exchange 2016.

In addition to Hybrid Configuration Wizard improvements, multi-forest hybrid deployments are being simplified with Azure Active Directory Connect (AADConnect). AADConnect introduces management agents that will make it significantly easier to synchronize multiple on-premises Active Directory forests with a single Microsoft 365 or Office 365 organization. For more information about AADConnect, see Integrating your on-premises identities with Azure Active Directory.

Exchange ActiveSync clients will be seamlessly redirected to Microsoft 365 or Office 365 when a user's mailbox is moved to Exchange Online. To support this, ActiveSync clients need to support HTTP 451 redirect. When a client is redirected, the profile on the device is updated with the URL of the Exchange Online service. This means the client will no longer attempt to contact the on-premises Exchange server when trying to find the mailbox.

Messaging policy and compliance

There are several new and updated message policy and compliance features in Exchange 2016.

Data loss prevention

To comply with business standards and industry regulations, organizations need to protect sensitive information and prevent its inadvertent disclosure. Examples of sensitive information that you might want to prevent from leaking outside your organization include credit card numbers, social security numbers, health records, or other personally identifiable information (PII). With a DLP policy and mail flow rules (also known as transport rules) in Exchange 2016, you can now identify, monitor, and protect 80 different types of sensitive information with new conditions and actions:

- With the new condition **Any attachment has these properties, including any of these words**, a mail flow rule can match messages where the specified property of the attached Office document contains specified words. This condition makes it easy to integrate your Exchange mail flow rules and DLP policies with SharePoint, Windows Server 2012 R2 File Classification Infrastructure (FCI), or a third-party classification system.
- With the new action **Notify the recipient with a message**, a mail flow rule can send a notification to the recipient with the text you specify. For example, you can inform the recipient that the message was rejected by a mail flow rule, or that it was marked as spam and will be delivered to their Junk Email folder.
- The action **Generate incident report and send it to** has been updated to enable the notification of multiple recipients by allowing a group address to be configured as the recipient.

To learn more about DLP, see Data loss prevention in Exchange 2016.

In-place Archiving, retention, and eDiscovery

Exchange 2016 includes the following improvements to In-Place Archiving, retention, and eDiscovery to help your organization meet its compliance needs:

- **Public folder support for In-Place eDiscovery and In-Place Hold**: Exchange 2016 integrates public folders into the In-Place eDiscovery and Hold workflow. You can use In-Place eDiscovery to search public folders in your organization, and you can put an In-Place Hold on public folders. And similar to placing a mailbox on hold, you can place a query-based and a time-based hold on public folders. Currently, you can only search and place a hold on all public folders. In later releases, you'll be able to choose specific public folders to search and place on hold. For more information, see Search and place a hold on public folders using In-Place eDiscovery.

- **Compliance Search**: Compliance Search is a new eDiscovery search tool in Exchange 2016 with new and improved scaling and performance capabilities. You can use it to search very large numbers of mailboxes in a single search. In fact, there's no limit on the number of mailboxes that can be included in a single search, so you can search all mailboxes in your organization at once. There's also no limit on the number of searches that can run at the same time. For In-Place eDiscovery in Exchange 2016, the limits are the same as in Exchange 2013: you can search up to 10,000 mailboxes in a single search and your organization can run a maximum of two In-Place eDiscovery searches at the same time.

  In Exchange 2016, Compliance Search is only available by using the Exchange Management Shell. For information about using the Compliance Search cmdlets, see the following topics:

  - Get-ComplianceSearch
  - New-ComplianceSearch
  - Remove-ComplianceSearch
  - Set-ComplianceSearch
  - Start-ComplianceSearch
  - Stop-ComplianceSearch

  > **NOTE**
  >
  > To have access to the Compliance Search cmdlets, an administrator or eDiscovery manager must be assigned the Mailbox Search management role or be a member of the Discovery Management role group.

For more information, see Messaging policy and compliance in Exchange 2016.

Improved performance and scalability

In Exchange 2016, the search architecture has been redesigned. Previously, search was a synchronous operation that was not very fault-tolerant. The new architecture is asynchronous and decentralized. It distributes the work across multiple servers and keeps retrying if any servers are too busy. This means that we can return results more reliability, and faster.

Another advantage of the new architecture is that search scalability is improved. The number of mailboxes you can search at once using the console has increased from 5k to 10k for both mailboxes and archive mailboxes, allowing you to search a total of 20k mailboxes at the same time.

What's new when upgrading from Exchange 2010 to Exchange 2016 RTM?

Exchange admin center

Exchange 2016 architecture

Mail flow and the transport pipeline

Sharing and collaboration

Integration with SharePoint and Skype for Business

Clients

Batch mailbox moves

High availability and site resilience

Exchange workload management

Exchange admin center

Exchange 2016 provides a single unified management console that allows for ease of use and is optimized for management of on-premises, online, or hybrid deployments. The *Exchange admin center* (EAC) in Exchange 2016 replaces the Exchange Management Console (EMC) and the Exchange Control Panel (ECP) that were used in Exchange 2010 (but the name of the EAC virtual directory is still "ECP"). Some EAC features include:

- **List view**: The list view in EAC has been designed to remove key limitations that existed in ECP. ECP was limited to displaying up to 500 objects and, if you wanted to view objects that weren't listed in the details pane, you needed to use searching and filtering to find those specific objects. In Exchange 2016, the viewable limit from within the EAC list view is approximately 20,000 objects. After the EAC returns the results, the EAC client performs the searching and sorting, which greatly increases the performance compared to the ECP in Exchange 2010. In addition, paging has been added so that you can page to the results. You can also configure page size and export to a .csv file.

- **Add/Remove columns to the Recipient list view**: You can choose which columns to view, and with local cookies, you can save your custom list views per machine that you use to access the EAC.

- **Secure the ECP virtual directory**: You can control access to the EAC from inside and outside your corporate network without affecting user access to their Outlook on the web options. For more information, see Turn off access to the Exchange admin center.

- **Tool consolidation**: The functionality of these management tools has been integrated into the EAC:

  - The Public Folder administration console.

  - The Role Based Access Control (RBAC) User Editor in the Exchange Toolbox.

  - The Call Statistics and User Call Logs tools for Unified Messaging.

- **Notifications**: In Exchange 2016, the EAC now has a Notification viewer so that you can view notifications and alerts for:

  - Exchange certificates that are installed on any Exchange 2016 server in your organization that are expired or within 30 days of expiring.

  - Mailbox moves and migrations (Mailbox Replication Service or MRS tasks). Notifications are displayed when migrations are started, in process, and completed.

    You can also configure email addresses to receive these notifications in the EAC, or all events by using the **Set-Notification** cmdlet in the Exchange Management Shell.

- **Groups enhancements**: By default, up to 500 recipients are returned when you open the **Select Members** window, however, you can choose to list up to 10,000 recipients by clicking **Get All Results** beneath the recipient list. We now support browsing more than 500 recipients by using the scroll bar, and we've also added enhanced search features so you can filter recipients in the recipient list. You can filter by:

  - City
  - Company
  - Country/region
  - Department
  - Office
  - Title

- **Delivery reports**: Administrators can use the EAC to track delivery information for email messages sent to or received by any user in the organization. You just select a mailbox, and then search for messages sent to or received by a different user. You can filter the search by words in the subject line. The results track a message through the delivery process, and indicate whether the message was successfully delivered, is pending delivery, or wasn't delivered. For more information, see Track messages with delivery reports.

- **Certificate management**: Administrators can use the EAC to manage Exchange certificates on multiple servers from a central location, which helps to minimize the amount of interaction that's required to manage Exchange certificates. For more information about certificate management procedures in Exchange 2016, see Certificate procedures in Exchange 2016.

For more information about the EAC, see Exchange admin center in Exchange 2016.

Exchange 2016 architecture

Today, CPU horsepower is significantly less expensive and is no longer a constraining factor. With that constraint lifted, the primary design goal for Exchange 2016 is for simplicity of scale, hardware utilization, and failure isolation. With Exchange 2016, we reduced the number of server roles to two: the Mailbox and Edge Transport server roles.

The Mailbox server in Exchange 2016 includes all of the server components from the Mailbox, Client Access, Hub Transport, and Unified Messaging server roles in Exchange 2010:

- Client Access services provide authentication, limited redirection, and proxy services. Client Access services don't do any data rendering and offer all the usual client access protocols: HTTP, POP and IMAP, and SMTP.

- Mailbox services include: the backend client access protocols, Transport service, Mailbox databases, and Unified Messaging. The Mailbox server handles all activity for the active mailboxes on that server.

Like previous versions of Exchange. the Edge Transport role is typically deployed in your perimeter network, outside your internal Active Directory forest, and is designed to minimize the attack surface of your Exchange deployment. By handling all Internet-facing mail flow, it also adds additional layers of message protection and security against viruses and spam, and can apply mail flow rules (also known as transport rules) to control message flow.

The Exchange 2016 architecture provides the following benefits:

- **Version upgrade flexibility**: No more rigid upgrade requirements. Mailbox servers can be upgraded independently and in any order in relation to other Mailbox servers.

- **Session indifference**: With Exchange 2010, session affinity to the Client Access server role was required for several protocols. In Exchange 2016, the client access and mailbox components reside on the same Mailbox server. No session affinity is required between Mailbox servers, Edge Transport servers, or mail servers on the Internet. This allows inbound client connections to Mailbox servers to be balanced using techniques provided by load-balancing technology like least connection or round-robin.

- **Deployment simplicity**: With an Exchange 2010 site-resilient design, you needed up to eight different namespaces: two Internet Protocol namespaces, two for Outlook Web App fallback, one for Autodiscover, two for RPC Client Access, and one for SMTP. With Exchange 2016, the most organizations only need two namespaces for coexistence with Exchange 2010: one for client protocols and one for Autodiscover. Depending on how you configure your mail routing, you might also need an additional namespace for SMTP routing.

For more information about the Exchange 2016 architecture, see Exchange 2016 architecture.

Setup

Setup has been completely rewritten so that installing Exchange 2016 and making sure you've got the latest product rollups and security fixes is easier than ever. Here are some of the improvements we've made:

- **Improved readiness checks**: Readiness checks make sure that your computer and your organization are ready for Exchange 2016. After you've provided the necessary information about your installation to Setup, the readiness checks are run before installation begins. The new readiness check engine now runs through all checks before reporting back to you on what actions need to be performed before Setup can continue, and it does so faster than ever. As with previous versions of Exchange, you can tell Setup to install the Windows features that are required by Setup so you don't have to install them manually.

- **Simplified and modern wizard**: We've removed all the steps in the Setup wizard that aren't absolutely required for you to install Exchange. What's left is an easy-to-follow wizard that takes you through the installation process one step at a time.

For more information, see Planning and deployment.

Microsoft 365 or Office 365 hybrid

The Hybrid Configuration Wizard (HCW) that was included with Exchange 2013 is moving to become a cloud-based application. When you choose to configure a hybrid deployment in Exchange 2016, you'll be prompted to download and install the wizard as a small app. The wizard will function the same in previous versions of Exchange, with a few new benefits:

- The wizard can be updated quickly to support changes in the Microsoft 365 or Office 365 service.

- The wizard can be updated to account for issues that are encountered when customers try to configure a hybrid deployment.

- Improved troubleshooting and diagnostics to help you resolve issues that you encounter.

- The same wizard will be used by everyone who's configuring a hybrid deployment with Exchange 2013 or Exchange 2016.

In addition to Hybrid Configuration Wizard improvements, multi-forest hybrid deployments are being simplified with Azure Active Directory Connect (AADConnect). AADConnect introduces management agents that will make it significantly easier to synchronize multiple on-premises Active Directory forests with a single Microsoft 365 or Office 365 organization.

Exchange ActiveSync clients will be seamlessly redirected to Microsoft 365 or Office 365 when a user's mailbox is moved to Exchange Online. To support this, ActiveSync clients need to support HTTP 451 redirect. When a client is redirected, the profile on the device is updated with the URL of the Exchange Online service. This means the client will no longer attempt to contact the on-premises Exchange server when trying to find the mailbox.

Messaging policy and compliance

There are several new and updated message policy and compliance features in Exchange 2016.

Data loss prevention

Data loss prevention (DLP) capabilities help you protect your sensitive data and inform users of internal compliance policies. DLP can also help keep your organization safe from users who might mistakenly send sensitive information to unauthorized people. DLP helps you identify, monitor, and protect sensitive data through deep content analysis. Exchange 2016 offers built-in DLP policies based on regulatory standards such as personally identifiable information (PII) and payment card industry data security standards (PCI), and is extensible to support other policies important to your business. With a DLP policy in Exchange 2016, you can now identify, monitor, and protect 80 different types of sensitive information. For more information, see Sensitive information types in Exchange 2016. Additionally, the new policy tips in Outlook 2016 inform users about policy violations before sensitive data is sent.

To learn more, see Data loss prevention in Exchange 2016

Mail flow rules (transport rules)

You can use Exchange mail flow rules (also known as transport rules) to look for specific conditions in messages that pass through your organization and take action on them. For example, your organization might require that certain types of messages are blocked or rejected in order to meet legal or compliance requirements, or to implement specific business needs. Mail flow rules are similar to the Inbox rules that are available in Outlook. The main difference between mail flow rules and Inbox rules is that mail flow rules take action on messages while they're in transit as opposed to after the message is delivered. Mail flow rules also contain a richer set of conditions, exceptions, and actions, which gives you the flexibility to implement many types of messaging policies.

These features are new to mail flow rules in Exchange 2016:

- Exchange mail flow rules can now identify 80 different types of sensitive information, including 30 new sensitive information types focusing on identifiers from South America, Europe, and Asia. These 80 built-in types are included, but you can also develop your own type from scratch. For more information on these sensitive information types, see Sensitive information types in Exchange 2016.

- With the new condition **Any attachment has these properties, including any of these words**, a mail flow rule can match messages where the specified property of the attached Office document contains specified words. This condition makes it easy to integrate your Exchange mail flow rules and DLP policies with SharePoint, Windows Server 2012 R2 File Classification Infrastructure (FCI), or a third-party classification system.

- With the new action **Notify the recipient with a message**, a mail flow rule can send a notification to the recipient with the text you specify. For example, you can inform the recipient that the message was rejected by a mail flow rule, or that it was marked as spam and will be delivered to their Junk Email folder.

- The action **Generate incident report and send it to** has been updated to enable the notification of multiple recipients by allowing a group address to be configured as the recipient

- Additional mail flow rules predicates and actions.

For more information, see Mail flow rules in Exchange 2016.

Azure Rights Management connector

The Azure Rights Management connector (also known as the Microsoft Rights Management connector or RMS connector) is an optional application that helps you enhance data protection for your Exchange 2016 server by connecting to the cloud-based Azure Rights Management service (also known as Microsoft Rights Management or Azure RMS). Once you install the RMS connector, it provides continuous data protection throughout the life span of the information and because these services are customizable, you can define the level of protection you need. For example, you can limit email message access to specific users or set view-only rights for certain messages.

For more information, see Deploying the Azure Rights Management connector.

In-place Archiving, retention, and eDiscovery

Exchange 2016 includes the following improvements to In-Place Archiving, retention, and eDiscovery to help your organization meet its compliance needs:

- **In-Place Hold**: In-Place Hold is a unified hold model that allows you to meet legal hold requirements in the following scenarios:
  - Preserve the results of the query (query-based hold), which allows for scoped immutability across mailboxes.
  - Place a time-based hold to meet retention requirements (for example, retain all items in a mailbox for seven years, a scenario that required the use of Single Item Recovery/Deleted Item Retention in Exchange 2010).
  - Place a mailbox on indefinite hold (similar to litigation hold in Exchange 2010).
  - Place a user on multiple holds to meet different case requirements.
- **In-Place eDiscovery**: In-Place eDiscovery allows authorized users to search mailbox data across all mailboxes and In-Place Archives in an Exchange 2016 organization and copy messages to a discovery mailbox for review. In Exchange 2016, In-Place eDiscovery allows discovery managers to perform more efficient searches and hold.
  - **Federated search** allows you to search and preserve data across multiple data repositories. With Exchange 2016, you can perform in-place eDiscovery searches across Exchange, SharePoint, and Skype for Business. You can use the eDiscovery Center in SharePoint 2013 to perform In-Place eDiscovery search and hold.
  - **Query-based In-Place Hold** allows you to save the results of the query, which allows for scoped immutability across mailboxes.
  - **Export search results** Discovery Managers can export mailbox content to a .pst file from the SharePoint 2013 eDiscovery Console. Mailbox export request cmdlets are no longer required to export a mailbox to a .pst file.
  - **Keyword statistics**: Search statistics are offered on a per search term basis. This enables a Discovery Manager to quickly make intelligent decisions about how to further refine the search query to provide better results. eDiscovery search results are sorted by relevance.
  - **KQL syntax**: Discovery Managers can use Keyword Query Language (KQL) syntax in search queries. KQL is similar to the Advanced Query Syntax (AQS), that was used for discovery searches in Exchange 2010.
  - **In-Place eDiscovery and Hold wizard**: Discovery Managers can use the In-Place eDiscovery and Hold wizard to perform eDiscovery and hold operations.

    > **NOTE**
    >
    > If SharePoint 2013 isn't available, a subset of the eDiscovery functionality is available in the Exchange admin center.

  - **Public folder support for In-Place eDiscovery and In-Place Hold**: Exchange 2016 has integrated public folders into the In-Place eDiscovery and Hold workflow. You can use In-Place eDiscovery to search public folders in your organization, and you can put a In-Place Hold on public folders. And similar to placing a mailbox on hold, you can place a query-based and a time-based hold on public folders. Currently, you can only search and place a hold on all public folders. In later releases, you'll be able to choose specific public folders to search and place on hold. For more information, see Search and place a hold on public folders using In-Place eDiscovery.
  - **Compliance Search**: Compliance Search is a new eDiscovery search tool in Exchange 2016 with

  new and improved scaling and performance capabilities. You can use it to search very large numbers of mailboxes in a single search. In fact, there's no limit on the number of mailboxes that can be included in a single search, so you can search all mailboxes in your organization at once. There's also no limit on the number of searches that can run at the same time. For In-Place eDiscovery in Exchange 2016, the limits are the same as in Exchange 2013: you can search up to 10,000 mailboxes in a single search and your organization can run a maximum of two In-Place eDiscovery searches at the same time.

  In Exchange 2016, Compliance Search is only available by using the Exchange Management Shell. For information about using the Compliance Search cmdlets, see the following topics:

  - Get-ComplianceSearch
  - New-ComplianceSearch
  - Remove-ComplianceSearch
  - Set-ComplianceSearch
  - Start-ComplianceSearch
  - Stop-ComplianceSearch

  > **NOTE**
  >
  > To have access to the Compliance Search cmdlets, an administrator or eDiscovery manager must be assigned the Mailbox Search management role or be a member of the Discovery Management role group.

- **Search across primary and archive mailboxes in Outlook on the web**: Users can search across their primary and archive mailboxes in Outlook on the web. Two separate searches are no longer necessary.

- **Archive Skype for Business content**: Exchange 2016 supports archiving of Skype for Business content in a user's mailbox. You can place Skype for Business content on hold using In-Place Hold and use In-Place eDiscovery to search Skype for Business content archived in Exchange.

For more information, see Messaging policy and compliance in Exchange 2016.

Auditing

Exchange 2016 includes the following improvements to auditing:

- **Auditing reports**: The EAC includes auditing functionality so that you can run reports or export entries from the mailbox audit log and the administrator audit log. The mailbox audit log records whenever a mailbox is accessed by someone other than the person who owns the mailbox. This can help you determine who has accessed a mailbox and what they have done. The administrator audit log records any action, based on an Exchange Management Shell cmdlet, performed by an administrator. This can help you troubleshoot configuration issues or identify the cause of problems related to security or compliance. For more information, see Exchange Auditing Reports.

- **Viewing the administrator audit log**: Instead of exporting the administrator audit log, which can take up to 24 hours to receive in an email message, you can view administrator audit log entries in the EAC. To do this, go to **Compliance Management** > **Auditing** and click **View the administrator audit log**. Up to 1000 entries will be displayed on multiple pages. To narrow the search, you can specify a date range.

  As an additional improvement, you can also export the audit log data in a format that's common to both Exchange 2016 and SharePoint Server 2016. This makes it easier to integrate with third-party tools to view the data and create richer reports.

  For more information, see View the Administrator Audit Log.

Antimalware protection

The built-in malware filtering capabilities of Exchange 2016 helps protect your network from malicious software that's transferred by email messages. All messages sent or received by your Exchange 2016 Mailbox server are scanned for malware (viruses and spyware) by using the built-in Malware Agent. If malware is detected, the message is deleted. Notifications may also be sent to senders or administrators when an infected message is deleted and not delivered. You can also choose to replace infected attachments with either default or custom messages that notify the recipients of the malware detection.

For more information about antimalware protection, see Antimalware protection in Exchange 2016.

Mail flow and the transport pipeline

How messages flow through an organization and what happens to them has changed significantly in Exchange 2016. Following is a brief overview of the changes:

- **Transport pipeline**: The transport pipeline in Exchange 2016 is now made up of several different services: the Front End Transport service, the Transport service, and the Mailbox Transport service. For more information, see Mail flow and the transport pipeline.

- **Routing**: Mail routing in Exchange 2016 recognizes DAG boundaries as well as Active Directory site boundaries. Also, mail routing has been improved to queue messages more directly for internal recipients. For more information, see Mail routing.

- **Connectors**: The default maximum message size for a Send connector or a Receive connector has increased from 10MB to 25MB. For more information, see Connector limits.

  You can configure Send connectors to route outbound mail through the Front End transport service on Mailbox servers. For more information, see Configure Send connectors to proxy outbound mail.

Recipients

Administrators can now use the EAC to create a *group naming policy*, which lets you standardize and manage the names of distribution groups that are created by users in your organization. You can automatically add a prefix or suffix to the name of the distribution group when it's created, and you can block specific words from being used in group names. For more information, see Create a Distribution Group Naming Policy.

For more information about recipients in Exchange 2016, see Recipients.

Sharing and collaboration

Exchange 2016 includes the following enhancements for sharing and collaboration:

- **Public folders**: Public folders now take advantage of the existing high availability and storage technologies of the mailbox store. The public folder architecture uses specially designed mailboxes to store both the hierarchy and the public folder content. This new design also means that there is no longer a public folder database. Public folder replication now uses the continuous replication model. High availability for the hierarchy and content mailboxes is provided by the database availability group (DAG). With this design, we're moving away from a multi-master replication model to a single-master replication model. For more information, see Public folders.

- **Shared mailboxes**: In previous versions of Exchange, creating a shared mailbox was a multi-step process in which you had to use the Exchange Management Shell to set the delegate permissions. Now you can create a shared mailbox in one step via the Exchange admin center (EAC). In the EAC, go to **Recipients** > **Shared** to create a shared mailbox. Shared mailboxes are a recipient type so you can easily search for your shared mailboxes in either the EAC or by using the Exchange Management Shell. For more information, see Shared mailboxes.

Integration with SharePoint and Skype for Business

Exchange 2016 offers greater integration with SharePoint and Skype for Business. Benefits of this enhanced integration include:

- Skype for Business Server 2015 can archive content in Exchange 2016 and use Exchange 2016 as a contact store.
- Discovery Managers can perform In-Place eDiscovery and Hold searches across SharePoint, Exchange, and Skype for Business data.

For more information, see Plan Exchange 2016 integration with SharePoint and Skype for Business.

Clients

Outlook on the web (formerly Outlook Web App)

Outlook Web App is now known as Outlook on the web, which continues to let users access their Exchange mailbox from almost any web browser.

> **NOTE**
>
> Supported Web browsers for Outlook on the web in Exchange 2016 are Microsoft Edge, Internet Explorer 11, and the most recent versions of Mozilla Firefox, Google Chrome, and Apple Safari.

In Exchange 2016, the former Outlook Web App user interface is updated and optimized for tablets and smart phones, in addition to desktop and laptop computers. New Exchange 2016 features include:

- **Platform-specific experiences for phones** for both iOS and Android.
- **Premium Android experience** using Chrome on devices running Android version 4.2 or later.
- **Apps for Outlook** which allow users and administrators to extend the capabilities of Outlook on the web.
- **Email improvements**, including a new single-line view of the Inbox with an optimized reading pane, archiving, emojis, and the ability to undo mailbox actions like deleting a message or moving a message.
- **Contact linking** the ability for users to add contacts from their LinkedIn accounts.
- **Calendar** has an updated look and new features, including email reminders for Calendar events, ability to propose a new time in meeting invitations, improved search, and birthday calendars.
- **Search suggestions and refiners** for an improved search experience that helps users find the information they want, faster. Search suggestions try to anticipate what the user's looking for and returns results that might be what the user is looking for. Search refiners will help a user more easily find the information they're looking for by providing contextually-aware filters. Filters might include date ranges, related senders, and so on.
- **Themes** Exchange 2016 provides over 50 built-in themes.
- **Options** for individual mailboxes have been overhauled.
- **Link preview** which enables users to paste a link into messages, and Outlook on the web automatically generates a rich preview to give recipients a peek into the contents of the destination. This works with video links as well.
- **Inline video** player saves the user time by keeping them in the context of their conversations. An inline preview of a video automatically appears after inserting a video URL.
- **Link preview** which enables users to paste a link into messages, and Outlook on the web automatically generates a rich preview to give recipients a peek into the contents of the destination. This works with video links as well.

- **Pins and Flags** which allow users to keep essential emails at the top of their inbox (Pins) and mark others for follow-up (Flags). Pins are now folder specific, great for anyone who uses folders to organize their email. Quickly find and manage flagged items with inbox filters or the new Task module, accessible from the app launcher.

- **Performance improvements** in a number of areas across Outlook on the web, including creating calendar events, composing, loading messages in the reading pane, popouts, search, startup, and switching folders.

- **New Outlook on the web action pane** that allows you to quickly click those actions you most commonly use such as New, Reply all, and Delete. A few new actions have been added as well including Archive, Sweep, and Undo.

Offline Outlook on the web

Internet Explorer 11 and Windows Store apps using JavaScript support the Application Cache API (or AppCache) as defined in the HTML5 specification, which allows you to create offline web applications. AppCache enables webpages to cache (or save) resources locally, including images, script libraries, style sheets, and so on. In addition, AppCache allows URLs to be served from cached content using standard Uniform Resource Identifier (URI) notation. The following is a list of the browsers that support AppCache:

- Microsoft Edge

- Internet Explorer 11 or later versions

- Google Chrome 44 or later versions

- Mozilla Firefox 39 or later versions

- Apple Safari 8 or later (only on OS X/iOS) versions

MAPI over HTTP

MAPI over HTTP is now the default protocol that Outlook uses to communicate with Exchange. MAPI over HTTP improves the reliability and stability of the Outlook and Exchange connections by moving the transport layer to the industry-standard HTTP model. This allows a higher level of visibility of transport errors and enhanced recoverability. Additional functionality includes support for an explicit pause-and-resume function, which enables supported clients to change networks or resume from hibernation while maintaining the same server context.

Note: MAPI over HTTP isn't enabled in organizations where the following conditions are both true:

- You're installing Exchange 2016 in an organization that already has Exchange 2013 servers installed.

- MAPI over HTTP wasn't enabled in Exchange 2013.

While MAPI over HTTP is now the default communication protocol between Outlook and Exchange, clients that don't support it will fall back to Outlook Anywhere (RPC over HTTP). RPC (RPC over TCP) is no longer supported.

For more information, see MAPI over HTTP in Exchange 2016.

Document collaboration

Exchange 2016, along with SharePoint Server 2016, enables Outlook on the web users to link to and share documents that are stored in OneDrive for Business in an on-premises SharePoint server instead of attaching files to messages. Users in an on-premises environment can collaborate on files in the same manner that's used in Microsoft 365 or Office 365.

For more information about SharePoint Server 2016, see New and improved features in SharePoint Server 2016.

When an Exchange 2016 user receives a Word, Excel, or PowerPoint file in an email attachment, and the file is stored in OneDrive for Business or on-premises SharePoint, the user will now have the option of viewing and editing that file in Outlook on the web alongside the message. To do this, you'll need a separate computer in your on-premises organization that's running Office Online Server. For more information, see Install Office Online

Server in an Exchange 2016 organization.

Exchange 2016 also brings the following improvements to document collaboration:

- Saving files to OneDrive for Business.
- Uploading a file to OneDrive for Business.
- Most Recently Used lists populated with both local and online files.

Batch mailbox moves

Exchange 2016 makes use of batch moves. The move architecture is built on top of MRS (Mailbox Replication service) moves with enhanced management capability. The batch move architecture features the following enhancements:

- Ability to move multiple mailboxes in large batches.
- Email notification during move with reporting.
- Automatic retry and automatic prioritization of moves.
- Primary and personal archive mailboxes can be moved together or separately.
- Option for manual move request finalization, which allows you to review a move before you complete it.
- Periodic incremental syncs to migrate the changes.

For more information, see Manage on-premises mailbox moves in Exchange 2016.

High availability and site resilience

The high availability model of the mailbox component has not changed significantly since Exchange 2010. The unit of high availability is still the database availability group (DAG). The DAG still uses Windows Server failover clustering. Continuous replication still supports both file mode and block mode replication. However, there have been some improvements. Failover times have been reduced as a result of transaction log code improvements and deeper checkpoint on the passive databases. The Exchange Store service has been re-written in managed code. Now, each database runs under its own process, which isolates store issues to a single database.

Exchange 2016 uses DAGs and mailbox database copies, along with other features such as single item recovery, retention policies, and lagged database copies, to provide high availability, site resilience, and Exchange native data protection. The high availability platform, the Exchange Information Store and the Extensible Storage Engine (ESE), have all been enhanced to provide greater availability, easier management, and to reduce costs. These enhancements include:

- **Managed availability**: With managed availability, internal monitoring and recovery-oriented features are tightly integrated to help prevent failures, proactively restore services, and initiate server failovers automatically or alert administrators to take action. The focus is on monitoring and managing the end user experience rather than just server and component uptime to help keep the service continuously available.
- **Managed Store**: See the Managed Store section.
- **Support for multiple databases per disk**: Exchange 2016 includes enhancements that enable you to support multiple databases (mixtures of active and passive copies) on the same disk, thereby leveraging larger disks in terms of capacity and IOPS as efficiently as possible.
- **Automatic reseed**: Enables you to quickly restore database redundancy after disk failure. If a disk fails, the database copy stored on that disk is copied from the active database copy to a spare disk on the same server. If multiple database copies were stored on the failed disk, they can all be automatically re-seeded on a spare disk. This enables faster reseeds, as the active databases are likely to be on multiple servers and the data is copied in parallel.

- **Automatic recovery from storage failures**: This feature continues the innovation that was introduced in Exchange 2010 to allow the system to recover from failures that affect resiliency or redundancy. In addition to the Exchange 2010 bugcheck behaviors, Exchange 2016 includes additional recovery behaviors for long I/O times, excessive memory consumption by `MSExchangeRepl.exe`, and severe cases where the system is in such a bad state that threads can't be scheduled.

- **Lagged copy enhancements**: Lagged copies can now use automatic log play down to care for themselves (to a certain extent). Lagged copies will automatically play down log files in a variety of situations, such as single page restore and low disk space scenarios. If the system detects that page patching is required for a lagged copy, the logs will be automatically replayed into the lagged copy. Lagged copies will also invoke this auto replay feature when a low disk space threshold has been reached, and when the lagged copy has been detected as the only available copy for a specific period of time. In addition, lagged copies can leverage Safety Net, making recovery or activation much easier. *Safety Net* is improved functionality in Exchange 2016 based on the transport dumpster of Exchange 2010.

- **Single copy alert enhancements**: The single copy alert that was introduced in Exchange 2010 is no longer a separate scheduled script. It's now integrated into the managed availability components within the system and is a native function within Exchange.

- **DAG network auto-configuration**: DAGs networks can be automatically configured by the system based on configuration settings. In addition to manual configuration options, DAGs can also distinguish between MAPI and Replication networks and configure DAG networks automatically.

For more information about these features, see High availability and site resilience and Changes to high availability and site resilience over previous versions.

Managed Store

In Exchange 2016, *Managed Store* is the name of the Information Store processes, `Microsoft.Exchange.Store.Service.exe` and `Microsoft.Exchange.Store.Worker.exe`. The new Managed Store is written in C# and is tightly integrated with the Microsoft Exchange Replication service (`MSExchangeRepl.exe`) to provide higher availability through improved resiliency. In addition, the Managed Store allows more granular management of resource consumption, and has improved diagnostics for faster root cause analysis.

The Managed Store works with the Microsoft Exchange Replication service to manage mailbox databases, which continue to use the Extensible Storage Engine (ESE) database engine. Exchange 2016 includes significant changes to the mailbox database schema that provide many optimizations over previous versions of Exchange. The Microsoft Exchange Replication service is also responsible for all service availability related to Mailbox servers. These architectural changes enable faster database failover and better physical disk failure handling.

The Managed Store uses the same search platform as SharePoint Server 2016 to provide more robust indexing and searching when compared to Microsoft Search engine that was used in previous versions of Exchange.

For more information, see High availability and site resilience.

Exchange workload management

An Exchange workload is an Exchange server feature, protocol, or service that has been explicitly defined for the purposes of Exchange system resource management. Each Exchange workload consumes system resources such as CPU, mailbox database operations, or Active Directory requests to execute user requests or run background work. Examples of Exchange workloads include Outlook on the web, Exchange ActiveSync, mailbox migration, and mailbox assistants.

There are two ways to manage Exchange workloads in Exchange 2016:

- **Monitor the health of system resources**: Managing workloads based on the health of system resources.

- **Control how resources are consumed by individual users**: Controlling how resources are consumed by individual users was possible in Exchange 2010 (user throttling), and this capability has been expanded for Exchange 2016.

For more information about these features, see User workload management in Exchange 2016.

What's discontinued in Exchange Server

8/3/2020 • 7 minutes to read • Edit Online

This topic discusses the components, features, and functionality that's been removed, discontinued, or replaced in Exchange 2019.

Discontinued features from Exchange 2016 to Exchange 2019

This section lists the Exchange 2016 features that are no longer available in Exchange 2019.

Architecture

FEATURE	COMMENTS AND MITIGATION
Unified Messaging (UM)	Unified Messaging has been removed from Exchange 2019. We recommend that Exchange 2019 organizations transition to Skype for Business Cloud Voice Mail.

Discontinued features from Exchange 2013 to Exchange 2019

This section lists the Exchange 2013 features that are no longer available in Exchange 2019.

Architecture

FEATURE	COMMENTS AND MITIGATION
Unified Messaging (UM)	Unified Messaging has been removed from Exchange 2019. We recommend that Exchange 2019 organizations transition to Skype for Business Cloud Voice Mail.
Client Access server role	The Client Access server role has been replaced by Client Access services that run on the Mailbox server role. The Mailbox server role now performs all functionality that was previously included with the Client Access server role. For more information about the new Mailbox server role, see Exchange Server architecture.
MAPI/CDO library	The MAPI/CDO library has been replaced by Exchange Web Services (EWS), Exchange ActiveSync (EAS), and Representational State Transfer (REST)* APIs. If an application uses the MAPI/CDO library, it needs to move to EWS, EAS, or the REST APIs to communicate with Exchange 2019.

* REST APIs will be included in a future release of Exchange 2019.

De-emphasized features in Exchange 2019

The following features are being de-emphasized in Exchange 2019 and may not be included in future versions of Exchange.

- Third-party replication APIs
- RPC over HTTP

- Database availability group (DAG) support for failover cluster administrative access points

This topic discusses the components, features, or functionality that have been removed, discontinued, or replaced in Exchange 2016.

Discontinued features from Exchange 2013 to Exchange 2016

This section lists the Exchange 2013 features that are no longer available in Exchange 2016.

Architecture

FEATURE	COMMENTS AND MITIGATION
Client Access server role	The Client Access server role has been replaced by Client Access services that run on the Mailbox server role. The Mailbox server role now performs all functionality that was previously included with the Client Access server role. For more information about the new Mailbox server role, see Exchange Server architecture.
MAPI/CDO library	The MAPI/CDO library has been replaced by Exchange Web Services (EWS), Exchange ActiveSync (EAS), and Representational State Transfer (REST)* APIs. If an application uses the MAPI/CDO library, it needs to move to EWS, EAS, or the REST APIs to communicate with Exchange 2016.

* REST APIs will be included in a future release of Exchange 2016.

De-emphasized features in Exchange 2016

The following features are being de-emphasized in Exchange 2016 and may not be included in future versions of Exchange.

- Third-party replication APIs
- RPC over HTTP
- Database Availability Group support for failover cluster administrative access points

Discontinued features from Exchange 2010 to Exchange 2016

This section lists the Exchange 2010 features that are no longer available in Exchange 2016.

Architecture

FEATURE	COMMENTS AND MITIGATION
Hub Transport server role	The Hub Transport server role has been replaced by Transport services which run on the Mailbox server role. The Mailbox server role includes the Microsoft Exchange Transport, Microsoft Exchange Mailbox Transport Delivery, the Microsoft Exchange Mailbox Transport Submission, and the Microsoft Exchange Frontend Transport service. For more information, see Mail flow and the transport pipeline.

FEATURE	COMMENTS AND MITIGATION
Unified Messaging server role	The Unified Messaging server role has been replaced by Unified Messaging services which run on the Mailbox and Client Access server roles. The Mailbox server role includes the Microsoft Exchange Unified Messaging service and the Client Access server role includes the Microsoft Exchange Unified Messaging Call Router service. For more information, see Voice Architecture Changes.
MAPI/CDO library	The MAPI/CDO library has been replaced by Exchange Web Services (EWS), Exchange ActiveSync (EAS), and Representational State Transfer (REST)* APIs. If an application uses the MAPI/CDO library, it needs to move to EWS, EAS, or the REST APIs to communicate with Exchange 2016.

* REST APIs will be included in a future release of Exchange 2016.

Management interfaces

FEATURE	COMMENTS AND MITIGATION
Exchange Management Console and Exchange Control Panel	The Exchange Management Console and the Exchange Control Panel have been replaced by the Exchange admin center (EAC). EAC uses the same virtual directory (/ecp) as the Exchange Control Panel. For more information, see Exchange admin center in Exchange Server.

Client access

FEATURE	COMMENTS AND MITIGATION
Outlook 2003 is not supported	To connect Microsoft Outlook to Exchange 2016, the use of the Autodiscover service is required. However, Microsoft Outlook 2003 doesn't support the use of the Autodiscover service.
RPC/TCP access for Outlook clients	In Exchange 2016, Microsoft Outlook clients can connect using Outlook Anywhere (RPC/HTTP) or MAPI over HTTP Outlook 2013 Service Pack 1 and later. If you have Outlook clients in your organization, using Outlook Anywhere and/or MAPI over HTTP is required. For more information, see Outlook Anywhere and MAPI over HTTP in Exchange Server.

Outlook Web App and Outlook

FEATURE	COMMENTS AND MITIGATION
Spell check	Outlook Web App no longer has built-in spell check services. Instead, it uses the spell check features in your Web browsers.
Customizable filters	Outlook Web App no longer has customizable filtered views and no longer supports saving filtered views to Favorites. Customizable filters have been replaced by fixed filters that can be used to view all messages, unread messages, messages sent to the user, or flagged messages.

FEATURE	COMMENTS AND MITIGATION
Message flags	The ability to set a custom date on a message flag isn't available in Outlook Web App. You can use Outlook to set custom dates.
Chat contact list	The chat contact list that appeared in the folder list in Outlook Web App for Exchange 2010 is no longer available.
Search folders	The ability for users to use Search folders isn't currently available in Outlook Web App.
Web Parts	Outlook on the web no longer includes support for Web Parts. Customers will need to develop replacement functionality to meet this need in their environments.

Mail flow

FEATURE	COMMENTS AND MITIGATION
Linked connectors	The ability to link a Send connector to a Receive connector has been removed. Specifically, the *LinkedReceiveConnector* parameter has been removed from New-SendConnector and Set-SendConnector.

Antispam and antimalware

FEATURE	COMMENTS AND MITIGATION
Antispam agent management in the EMC	In Exchange 2010, when you enabled the antispam agents on a Hub Transport server, you could manage the antispam agents in the Exchange Management Console (EMC). In Exchange 2016, when you enable the antispam agents on a Mailbox server, you can't manage the agents using the EAC. You can only use the Exchange Management Shell. For information about how to enable the antispam agents on a Mailbox server, see Enable antispam functionality on Mailbox servers.
Connection Filtering agent on Hub Transport servers	In Exchange 2010, when you enabled the antispam agents on a Hub Transport server, the Attachment Filter agent was the only antispam agent that wasn't available. In Exchange 2016, when you enable the antispam agents on a Mailbox server, the Attachment Filter agent and the Connection Filtering agent aren't available. The Connection Filtering agent provides IP Allow List and IP Block List capabilities. For information about how to enable the antispam agents on a Mailbox server, see Enable antispam functionality on Mailbox servers. **Note**: The only way to enable the Connection Filtering agent is to install an Edge Transport server in the perimeter network. For more information, see Edge Transport servers.

Messaging policy and compliance

FEATURE	COMMENTS AND MITIGATION

FEATURE	COMMENTS AND MITIGATION
Managed Folders	In Exchange 2010, you use managed folders for messaging retention management (MRM). In Exchange 2016, managed folders aren't supported. You must use retention policies for MRM. **Note**: Cmdlets related to managed folders are still available. You can create managed folders, managed content settings and managed folder mailbox policies, and apply a managed folder mailbox policy to a user, but the MRM assistant skips processing of mailboxes that have a managed folder mailbox policy applied.
Port Managed Folder wizard	In Exchange 2010, you use the Port Managed Folder wizard to create retention tags based on managed folder and managed content settings. In Exchange 2016, the Exchange admin center doesn't include this functionality. You can use the **New-RetentionPolicyTag** cmdlet with the *ManagedFolderToUpgrade* parameter to create a retention tag based on a managed folder.

Unified Messaging and voice mail

FEATURE	COMMENTS AND MITIGATION
Directory lookups using Automatic Speech Recognition (ASR)	In Exchange 2010, Outlook Voice Access users can use speech inputs using Automatic Speech Recognition (ASR) to search for users listed in the directory. Speech inputs could be also used in Outlook Voice Access to navigate menus, messages, and other options. However, even if an Outlook Voice Access user is able to use speech inputs, they have to use the telephone key pad to enter their PIN, and navigate personal options. In Exchange 2016, authenticated and non-authenticated Outlook Voice Access users can't search for users in the directory using speech inputs or ASR in any language. However, callers that call into an auto attendant can use speech inputs in multiple languages to navigate auto attendant menus and search for users in the directory.

Mailbox database copies

FEATURE	COMMENTS AND MITIGATION
Update-MailboxDatabaseCopy Update Mailbox Database Copy wizard	Content index catalog seeding is no longer possible over the replication network; it can only be done over a MAPI network. This is true even when you use the `-Network` parameter in the **Update-MailboxDatabaseCopy** cmdlet.

Updates for Exchange Server

8/3/2020 • 2 minutes to read • Edit Online

Exchange follows a quarterly delivery model to release Cumulative Updates (CUs) that address issues reported by customers. CUs sometimes also add new features and functionality.

Critical product updates are packages that address a Microsoft-released security bulletin or that contain a change in time zone definitions. When in Mainstream Support, critical product updates are released as needed on a monthly basis for the most recently released CU and for the immediately previous CU. When in Extended Support, critical product updates are released as needed on a monthly basis for only the most recently released CU.

Each CU is a full installation of Exchange that includes all updates and changes from previous CUs. When installing a new Exchange server using the latest released CU, you don't need to install Exchange RTM or any previously released CU.

VERSION	BLOG POST	
Exchange 2019 CU6	Released: June 2020 Quarterly Exchange Updates	
Exchange 2019 CU5	Released: March 2020 Quarterly Exchange Updates	
Exchange 2019 CU4	Released: December 2019 Quarterly Exchange Updates	
Exchange 2019 CU3	Released: September 2019 Quarterly Exchange Updates	
Exchange 2019 CU2	Released: June 2019 Quarterly Exchange Updates	
Exchange 2019 CU1	Released: February 2019 Quarterly Exchange Updates	
Exchange 2019 RTM	Exchange Server 2019 Now Available	

For information about the new features you'll get when you upgrade to Exchange 2019 from previous versions of Exchange, see What's new in Exchange Server.

To get the latest version of Exchange 2016, download and install Cumulative Update 17 for Exchange Server 2016. Because each CU is a full installation of Exchange that includes updates and changes from all previous CUs, you don't need to install any previous CUs or Exchange 2016 RTM first.

The following table contains links to Exchange Team blog posts ("What's New" information) for this and other Exchange 2016 CUs.

VERSION	BLOG POST
Exchange 2016 CU17	Released: June 2020 Quarterly Exchange Updates

VERSION	BLOG POST
Exchange 2016 CU16	Released: March 2020 Quarterly Exchange Updates
Exchange 2016 CU15	Released: December 2019 Quarterly Exchange Updates
Exchange 2016 CU14	Released: September 2019 Quarterly Exchange Updates
Exchange 2016 CU13	Released: June 2019 Quarterly Exchange Updates
Exchange 2016 CU12	Released: February 2019 Quarterly Exchange Updates
Exchange 2016 CU11	Released: October 2018 Quarterly Exchange Updates
Exchange 2016 CU10	Released: June 2018 Quarterly Exchange Updates
Exchange 2016 CU9	Released: March 2018 Quarterly Exchange Updates
Exchange 2016 CU8	Released: December 2017 Quarterly Exchange Updates
Exchange 2016 CU7	Released: September 2017 Quarterly Exchange Updates
Exchange 2016 CU6	Released: June 2017 Quarterly Exchange Updates
Exchange 2016 CU5	Released: March 2017 Quarterly Exchange Updates
Exchange 2016 CU4	Released: December 2016 Quarterly Exchange Updates
Exchange 2016 CU3	Released: September 2016 Quarterly Exchange Updates
Exchange 2016 CU2	Released: June 2016 Quarterly Exchange Updates
Exchange 2016 CU1	Released: March 2016 Quarterly Exchange Updates
Exchange 2016 RTM	Exchange Server 2016: Forged in the cloud. Now available on-premises

For information about the new features you'll get when you upgrade to Exchange 2016 from previous versions of Exchange, see What's new in Exchange Server.

- To upgrade to the latest CU after you've downloaded it, see Upgrade Exchange to the latest Cumulative Update.
- For downloads and updates for other versions of Exchange, see Exchange Server build numbers and release dates.

Exchange Server build numbers and release dates

8/3/2020 • 13 minutes to read • Edit Online

You can use the information in this topic to verify the version of Exchange that is running in your organization.

This topic is organized in sections that correspond to the major releases of Exchange. Each section lists build numbers for each Service Pack (SP), Cumulative Update (CU), or Update Rollup (RU) of the specific Exchange release.

Download links for the latest CU, RU, and SP for Exchange Server 2019, Exchange Server 2016, Exchange Server 2013, Exchange Server 2010, and Exchange Server 2007 are included.

> **NOTE**
>
> In the following sections, RTM stands for release to manufacturing (the first version of the product).

Exchange Server 2019

The table in this section provides build numbers and general release dates for each version of Microsoft Exchange Server 2019.

To view the build number of an Exchange 2019 server, run the following command in the Exchange Management Shell.

```
Get-ExchangeServer | Format-List Name,Edition,AdminDisplayVersion
```

PRODUCT NAME	RELEASE DATE	BUILD NUMBER (SHORT FORMAT)	BUILD NUMBER (LONG FORMAT)
Exchange Server 2019 CU6	June 16, 2020	15.2.659.4	15.02.0659.004
Exchange Server 2019 CU5	March 17, 2020	15.2.595.3	15.02.0595.003
Exchange Server 2019 CU4	December 17, 2019	15.2.529.5	15.02.0529.005
Exchange Server 2019 CU3	September 17, 2019	15.2.464.5	15.02.0464.005
Exchange Server 2019 CU2	June 18, 2019	15.2.397.3	15.02.0397.003
Exchange Server 2019 CU1	February 12, 2019	15.2.330.5	15.02.0330.005
Exchange Server 2019 RTM	October 22, 2018	15.2.221.12	15.02.0221.012
Exchange Server 2019 Preview	July 24, 2018	15.2.196.0	15.02.0196.000

Exchange Server 2016

The table in this section provides build numbers and general release dates for each version of Microsoft Exchange

Server 2016.

To view the build number of an Exchange 2016 server, run the following command in the Exchange Management Shell.

```
Get-ExchangeServer | Format-List Name,Edition,AdminDisplayVersion
```

PRODUCT NAME	RELEASE DATE	BUILD NUMBER (SHORT FORMAT)	BUILD NUMBER (LONG FORMAT)
Exchange Server 2016 CU17	June 16, 2020	15.1.2044.4	15.01.2044.004
Exchange Server 2016 CU16	March 17, 2020	15.1.1979.3	15.01.1979.003
Exchange Server 2016 CU15	December 17, 2019	15.1.1913.5	15.01.1913.005
Exchange Server 2016 CU14	September 17, 2019	15.1.1847.3	15.01.1847.003
Exchange Server 2016 CU13	June 18, 2019	15.1.1779.2	15.01.1779.002
Exchange Server 2016 CU12	February 12, 2019	15.1.1713.5	15.01.1713.005
Exchange Server 2016 CU11	October 16, 2018	15.1.1591.10	15.01.1591.010
Exchange Server 2016 CU10	June 19, 2018	15.1.1531.3	15.01.1531.003
Exchange Server 2016 CU9	March 20, 2018	15.1.1466.3	15.01.1466.003
Exchange Server 2016 CU8	December 19, 2017	15.1.1415.2	15.01.1415.002
Exchange Server 2016 CU7	September 19, 2017	15.1.1261.35	15.01.1261.035
Exchange Server 2016 CU6	June 27, 2017	15.1.1034.26	15.01.1034.026
Exchange Server 2016 CU5	March 21, 2017	15.1.845.34	15.01.0845.034
Exchange Server 2016 CU4	December 13, 2016	15.1.669.32	15.01.0669.032
Exchange Server 2016 CU3	September 20, 2016	15.1.544.27	15.01.0544.027
Exchange Server 2016 CU2	June 21, 2016	15.1.466.34	15.01.0466.034
Exchange Server 2016 CU1	March 15, 2016	15.1.396.30	15.01.0396.030
Exchange Server 2016 RTM	October 1, 2015	15.1.225.42	15.01.0225.042
Exchange Server 2016 Preview	July 22, 2015	15.1.225.16	15.01.0225.016

Exchange Server 2013

The table in this section provides build numbers and general release dates for each version of Microsoft Exchange Server 2013.

To view the build number of an Exchange 2013 server, run the following command in the Exchange Management Shell.

```
Get-ExchangeServer | Format-List Name,Edition,AdminDisplayVersion
```

PRODUCT NAME	RELEASE DATE	BUILD NUMBER (SHORT FORMAT)	BUILD NUMBER (LONG FORMAT)
Exchange Server 2013 CU23	June 18, 2019	15.0.1497.2	15.00.1497.002
Exchange Server 2013 CU22	February 12, 2019	15.0.1473.3	15.00.1473.003
Exchange Server 2013 CU21	June 19, 2018	15.0.1395.4	15.00.1395.004
Exchange Server 2013 CU20	March 20, 2018	15.0.1367.3	15.00.1367.003
Exchange Server 2013 CU19	December 19, 2017	15.0.1365.1	15.00.1365.001
Exchange Server 2013 CU18	September 19, 2017	15.0.1347.2	15.00.1347.002
Exchange Server 2013 CU17	June 27, 2017	15.0.1320.4	15.00.1320.004
Exchange Server 2013 CU16	March 21, 2017	15.0.1293.2	15.00.1293.002
Exchange Server 2013 CU15	December 13, 2016	15.0.1263.5	15.00.1263.005
Exchange Server 2013 CU14	September 20, 2016	15.0.1236.3	15.00.1236.003
Exchange Server 2013 CU13	June 21, 2016	15.0.1210.3	15.00.1210.003
Exchange Server 2013 CU12	March 15, 2016	15.0.1178.4	15.00.1178.004
Exchange Server 2013 CU11	December 15, 2015	15.0.1156.6	15.00.1156.006
Exchange Server 2013 CU10	September 15, 2015	15.0.1130.7	15.00.1130.007
Exchange Server 2013 CU9	June 17, 2015	15.0.1104.5	15.00.1104.005
Exchange Server 2013 CU8	March 17, 2015	15.0.1076.9	15.00.1076.009
Exchange Server 2013 CU7	December 9, 2014	15.0.1044.25	15.00.1044.025
Exchange Server 2013 CU6	August 26, 2014	15.0.995.29	15.00.0995.029
Exchange Server 2013 CU5	May 27, 2014	15.0.913.22	15.00.0913.022
Exchange Server 2013 SP1	February 25, 2014	15.0.847.32	15.00.0847.032
Exchange Server 2013 CU3	November 25, 2013	15.0.775.38	15.00.0775.038
Exchange Server 2013 CU2	July 9, 2013	15.0.712.24	15.00.0712.024

PRODUCT NAME	RELEASE DATE	BUILD NUMBER (SHORT FORMAT)	BUILD NUMBER (LONG FORMAT)
Exchange Server 2013 CU1	April 2, 2013	15.0.620.29	15.00.0620.029
Exchange Server 2013 RTM	December 3, 2012	15.0.516.32	15.00.0516.032

Exchange Server 2010

The tables in this section provide build numbers and general release dates for each version of Microsoft Exchange Server 2010.

To view the build number of an Exchange 2010 server, run the following command in the Exchange Management Shell:

```
Get-Command ExSetup | ForEach {$_.FileVersionInfo}
```

Exchange Server 2010 SP3 build numbers

PRODUCT NAME	RELEASE DATE	BUILD NUMBER (SHORT FORMAT)	BUILD NUMBER (LONG FORMAT)
Update Rollup 30 for Exchange Server 2010 SP3	February 11, 2020	14.3.496.0	14.03.0496.000
Update Rollup 29 for Exchange Server 2010 SP3	July 9, 2019	14.3.468.0	14.03.0468.000

Exchange Server 2010 RTM	November 9, 2009	14.0.639.21	14.00.0639.021

Exchange Server 2007

The tables in this section provide build numbers and general release dates for each version of Microsoft Exchange Server 2007.

NOTE

The version information for Exchange Server 2007 SP1 is displayed correctly in the Exchange Management Console, in the Exchange Management Shell, and in the **About Exchange Server 2007 Help** dialog box. However, after you apply Exchange 2007 SP1 to an Edge Transport server that's running the RTM version of Exchange 2007, the version information for the Edge Transport server isn't updated in the Exchange Management Console unless the Edge Transport server is resubscribed to the Active Directory site. This is because the Edge Transport server doesn't directly update Active Directory by using any configuration information. Instead, the version information for Edge Transport servers is recorded in Active Directory during the creation of an Edge Subscription.

To view the build number of an Exchange 2007 server, run the following command in the Exchange Management Shell:

```
Get-Command ExSetup | ForEach {$_.FileVersionInfo}
```

PRODUCT NAME	RELEASE DATE	BUILD NUMBER (SHORT FORMAT)	BUILD NUMBER (LONG FORMAT)
Update Rollup 23 for Exchange Server 2007 SP3	March 21, 2017	8.3.517.0	8.03.0517.000

Exchange 2000 Server post-SP3	August 2004	6.0.6603

PRODUCT NAME	RELEASE DATE	BUILD NUMBER
Exchange 2000 Server post-SP3	April 2004	6.0.6556
Exchange 2000 Server post-SP3	September 2003	6.0.6487
Exchange 2000 Server SP3	July 18, 2002	6.0.6249
Exchange 2000 Server SP2	November 29, 2001	6.0.5762
Exchange 2000 Server SP1	June 21, 2001	6.0.4712
Exchange 2000 Server	November 29, 2000	6.0.4417

Exchange Server 5.5

The following table lists the build numbers and general release dates for each version of Microsoft Exchange Server version 5.5.

PRODUCT NAME	RELEASE DATE	BUILD NUMBER
Exchange Server version 5.5 SP4	November 1, 2000	5.5.2653
Exchange Server version 5.5 SP3	September 9, 1999	5.5.2650
Exchange Server version 5.5 SP2	December 23, 1998	5.5.2448
Exchange Server version 5.5 SP1	August 5, 1998	5.5.2232
Exchange Server version 5.5	February 3, 1998	5.5.1960

Exchange Server 5.0

PRODUCT NAME	RELEASE DATE	BUILD NUMBER
Exchange Server 5.0 SP2	February 19, 1998	5.0.1460
Exchange Server 5.0 SP1	June 18, 1997	5.0.1458
Exchange Server 5.0	May 23, 1997	5.0.1457

Exchange Server 4.0

The following table lists the build numbers and general release dates for each version of Microsoft Exchange Server 4.0.

PRODUCT NAME	RELEASE DATE	BUILD NUMBER
Exchange Server 4.0 SP5	May 5, 1998	4.0.996
Exchange Server 4.0 SP4	March 28, 1997	4.0.995

PRODUCT NAME	RELEASE DATE	BUILD NUMBER
Exchange Server 4.0 SP3	October 29, 1996	4.0.994
Exchange Server 4.0 SP2	July 19, 1996	4.0.993
Exchange Server 4.0 SP1	May 1, 1996	4.0.838
Exchange Server 4.0 Standard Edition	June 11, 1996	4.0.837

Release notes for Exchange Server

8/3/2020 • 5 minutes to read • Edit Online

TIP

Looking for the Exchange 2013 release notes? See Release notes for Exchange 2013.

Welcome to Microsoft Exchange Server 2019! This topic contains important information that you need to know to successfully deploy Exchange 2019. Please read this topic completely before beginning your deployment.

Known issues in Exchange Server 2019

When you attempt to uninstall Exchange Server from Windows 2019 Server Core using the Exchange Setup Wizard, the operation will fail. The wizard attempts to launch the Windows Control Panel to uninstall Exchange, but the Control Panel does not exist in Windows Server Core. To uninstall Exchange from Windows Server Core, run the following Setup command from the command line:

~~~~
```PowerShell
Setup.exe /IAcceptExchangeServerLicenseTerms /mode:Uninstall
```
~~~~

This issue will be resolved in a future CU update for Exchange Server 2019.

Welcome to Microsoft Exchange Server 2016! This topic contains important information that you need to know to successfully deploy Exchange 2016. Please read this topic completely before beginning your deployment.

Setup

- **Installing Exchange using Delegate Admin permissions causes Setup to fail**: When a user who is a member of only the Delegated Setup role group attempts to install Exchange on a pre-provisioned server, Setup will fail. This happens because the Delegated Setup group lacks the permissions required to create and configure certain objects in Active Directory.

  To work around this issue, do one of the following:

  - Add the user installing Exchange to the Domain Admins Active Directory security group.

  - Install Exchange using a user that is a member of the Organization Management role group.

Mailbox

- **Moving mailboxes from earlier versions of Exchange to Exchange 2016 CU5 or later can fail**: When you attempt to move a mailbox from an earlier version of Exchange to Exchange CU5 or later using a migration batch request, the move might fail. This can happen if the migration system mailbox isn't located on an Exchange 2016 server with CU5 or later installed.

  Before you can move mailboxes to Exchange 2016 CU5 or later using a migration batch request, you need to move the migration mailbox to an Exchange server running CU5 or later using the following steps.

  1. Open the Exchange Management Shell on your Exchange 2016 Mailbox server.

  2. Run the following command to get a list of mailbox databases that are located on your Exchange

2016 servers. Copy the name of the mailbox database where you want to move the migration mailbox to the clipboard.

```
Get-MailboxDatabase | Where {$_.AdminDisplayVersion -Like "*15.1*"} | Format-Table Name,
ServerName
```

3. Run the following command to move the migration mailbox to your Exchange 2016 server. Paste the mailbox database name you copied in the previous step after *TargetDatabase*.

```
New-MoveRequest "Migration.8f3e7716-2011-43e4-96b1-aba62d229136" -TargetDatabase "<mailbox
database name>"
```

- **Mailbox servers running different versions of Exchange can be added to the same database availability group**: The **Add-DatabaseAvailabilityGroupServer** cmdlet and the Exchange admin center incorrectly allow an Exchange 2013 server to be added to an Exchange 2016-based database availability group (DAG), and vice versa. Exchange supports adding only Mailbox servers running the same version (Exchange 2013 versus Exchange 2016, for example) to a DAG. Additionally, the Exchange admin center displays both Exchange 2013 and Exchange 2016 servers in the list of servers available to add to a DAG. This could allow an administrator to inadvertently add a server running an incompatible version of Exchange to a DAG (for example, adding an Exchange 2013 server to an Exchange 2016-based DAG).

  There is currently no workaround for this issue. Administrators must be diligent when adding a Mailbox server to a DAG. Add only Exchange 2013 servers to Exchange 2013-based DAGs, and only Exchange 2016 servers to Exchange 2016-based DAGs. You can differentiate each version of Exchange by looking at the **Version** column in the list of servers in the Exchange admin center. The following are the server versions for Exchange 2013 and Exchange 2016:

  - **Exchange 2013** 15.0 (Build xxx.xx)
  - **Exchange 2016** 15.1 (Build xxx.xx)

- **Can't connect to archive mailbox when using MAPI over HTTP**: In Exchange 2016, MAPI over HTTP can be enabled per-mailbox. An issue exists that prevents users from accessing their archive mailbox, if one is configured, when the following are true:

  - MAPI over HTTP is enabled on the user's mailbox.
  - MAPI over HTTP is disabled at the organization level.

    When these conditions are true, the user won't be able to open their archive mailbox and they'll get the error **The set of folders cannot be opened. The attempt to log on to Microsoft Exchange has failed.**

    To work around the issue, do one of the following

  - Open the archive mailbox using Outlook on the web.
  - Disable MAPI over HTTP on the mailbox by running the following command.

  ```
  Set-CasMailbox <email address> -MapiHttpEnabled $False
  ```

- **Notifications Broker service stops after 30 seconds** When you start your Exchange server, you might notice the **Notifications Broker** service start and then stop after approximately 30 seconds. If you attempt to start the service manually, it will successfully start and then stop, again after approximately 30 seconds. No errors or warnings are included in the Event log.

This behavior is expected in on-premises deployments of Exchange 2016. The **Notifications Broker** service performs a configuration check on each time the server starts. If there is nothing for the **Notifications Broker** service to do, it stops automatically until the next time the server is restarted.

Mail flow

- **Edge Transport servers can reject mail sent to valid recipients** Exchange 2016 Edge Transport servers may reject messages sent to valid internal recipients when the following are true:

  - Exchange 2016 Cumulative Update 1 (CU1) is installed on the server.

  - Recipient validation is enabled on the server.

    When an Edge Transport rejects a message because of this issue, the sender will receive a non-delivery report (NDR) with the status code **5.1.10**, and the error **Recipient not found by SMTP address lookup**. The recipient won't receive the message.

    To work around the issue, do **one** of the following:

  - Disable recipient validation on the affected Edge Transport server(s) by running the following command.

    ```
    Set-RecipientFilterConfig -RecipientValidationEnabled $False
    ```

  - Disable the recipient validation cache on the affected Edge Transport server(s) by running the following command.

    ```
    Get-TransportService | Set-TransportService -RecipientValidationCacheEnabled $False
    ```

    Caution

    Disabling the recipient validation cache causes Exchange to verify that recipients on inbound messages are valid by querying the local instance of Active Directory Lightweight Directory Services. This can significantly increase the resources Exchange needs to process messages. Before you disable the recipient validation cache, verify that your server has sufficient capacity to handle the additional demand.

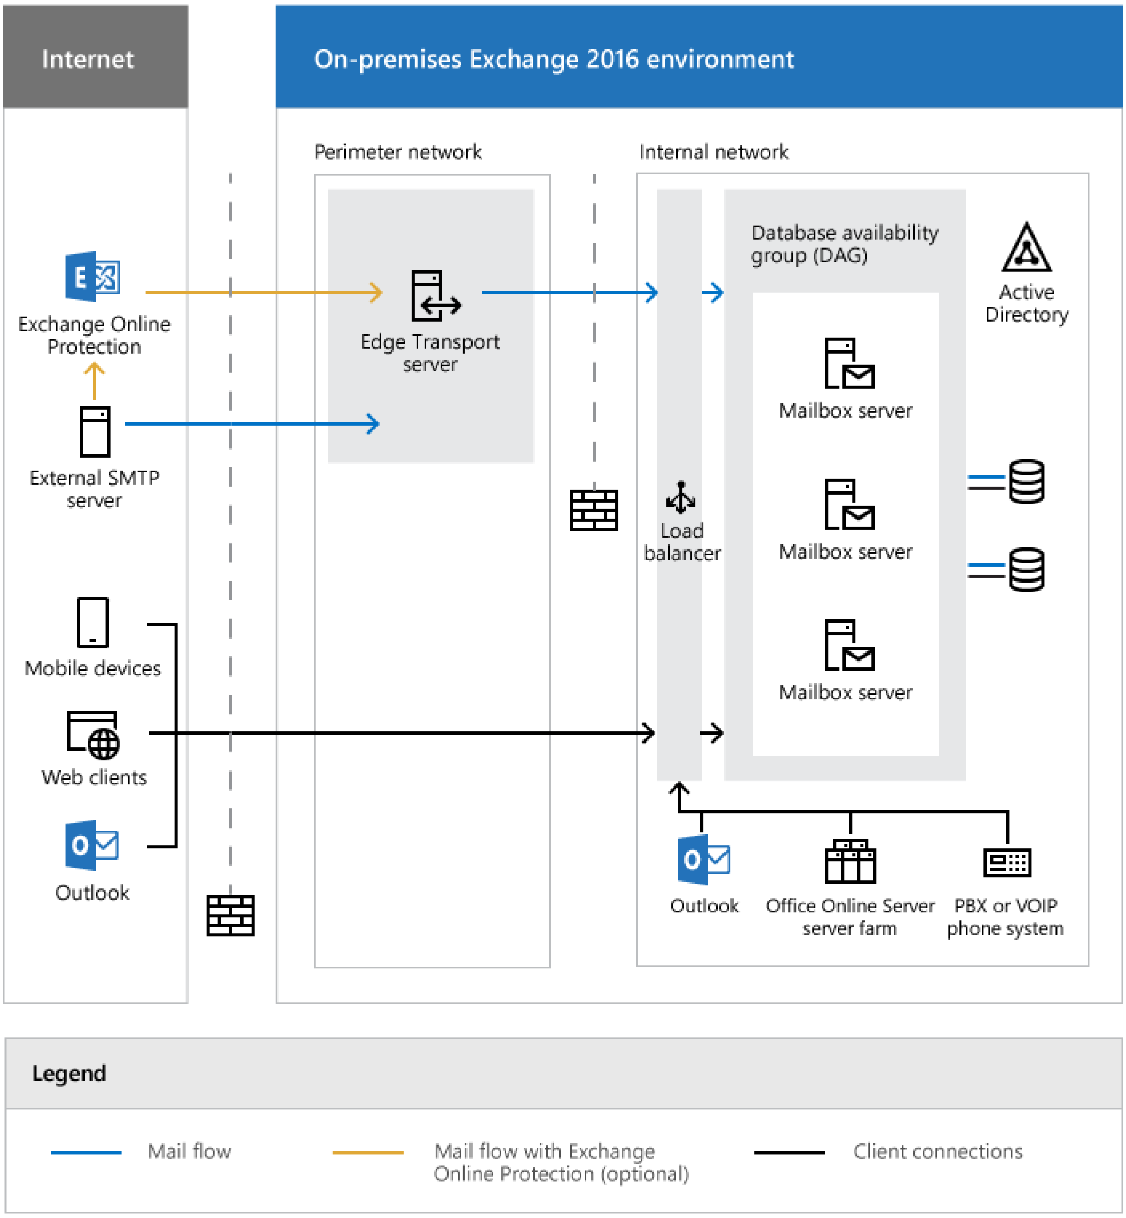
- Configure your firewall or external mail exchanger (MX) DNS record to send mail to an Edge Transport server that doesn't have Exchange 2016 Cumulative Update 1 installed. You might need to configure your firewall to allow TCP port 25 to connect to the new Internet-facing server.

- Configure your firewall or external MX DNS record to send mail to an Exchange 2016 Mailbox server. You might need to configure your firewall to allow TCP port 25 to connect to the new Internet-facing server.

Exchange architecture

8/3/2020 • 6 minutes to read • Edit Online

Exchange use a single building block architecture that provides email services for deployments at all sizes, from small organizations to the largest multi-national corporations. This architecture is describe in the following diagram.



Individual components are described in the following sections.

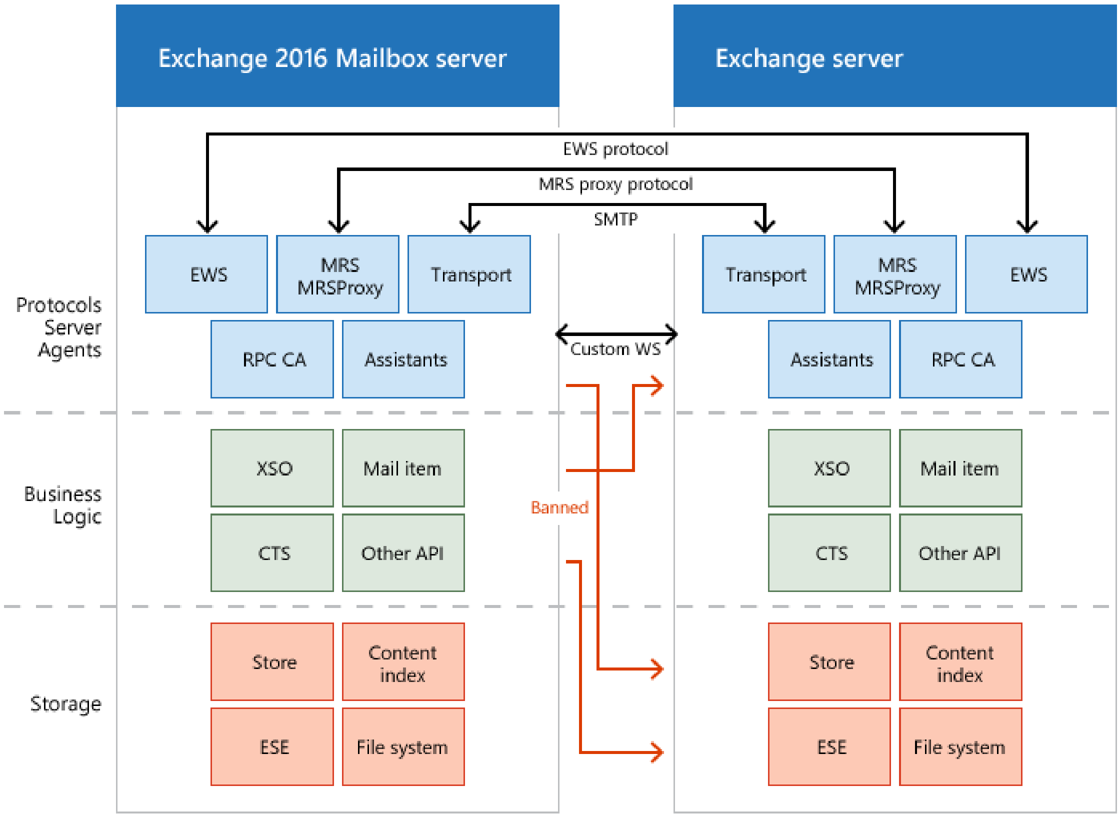
Server communication architecture

Communication between Exchange servers and past and future versions of Exchange occurs at the protocol layer. Cross-layer communication isn't allowed. This communication architecture is summarized as "every server is an island". This architecture has the following benefits:

- Reduced inter-server communications.

- Version-aware communications.
- Isolated failures.
- Integrated design inside each server.

Protocol layer communication between Exchange servers is shown in the following diagram.



Server role architecture

Exchange uses Mailbox servers and Edge Transport servers. These server roles are described in the following sections.

Mailbox servers

- Mailbox servers contain the transport services that are used to route mail. For more information, see Mail flow and the transport pipeline
- Mailbox servers contain mailbox databases that process, render, and store data. For more information, see Manage mailbox databases in Exchange Server.
- Mailbox servers contain the Client Access services that accept client connections for all protocols. These frontend services are responsible for routing or *proxying* connections to the corresponding backend services on a Mailbox server. Clients don't connect directly to the backend services. For more information, see the Client Access protocol architecture section later in this topic.
- In Exchange 2016, Mailbox servers contain the Unified Messaging (UM) services that provide voice mail and other telephony features to mailboxes.

> **NOTE**
>
> Unified Messaging is not available in Exchange 2019.

- You manage Mailbox servers by using the Exchange admin center (EAC) and the Exchange Management Shell. For more information, see Exchange admin center in Exchange Server and Exchange Server PowerShell (Exchange Management Shell).

Edge Transport servers

- Edge Transport servers handle all external mail flow for the Exchange organization.

- Edge Transport servers are typically installed in the perimeter network, and are subscribed to the internal Exchange organization. The EdgeSync synchronization process makes recipient and other configuration information available to the Edge Transport server as mail enters and leaves the Exchange organization.

- Edge Transport servers provide antispam and mail flow rules as mail enters and leaves your Exchange organization. For more information, see Antispam protection in Exchange Server

- You manage Edge Transport servers by using the Exchange Management Shell. For more information, see Exchange Server PowerShell (Exchange Management Shell).

For more information about Edge Transport servers, see Edge Transport servers.

High availability architecture

The high availability features in Exchange Server are described in the following sections.

Mailbox high availability

A database availability group (DAG) is the fundamental element of the high availability and site resilience framework that's built into Exchange Server. A DAG is a group of Mailbox servers that host a set of databases and provides automatic, database-level recovery from database, network, and server failures. And DAGs in Exchange 2016 or later have been improved compared to Exchange 2013. For more information about DAGs, see Database availability groups.

Transport high availability

- The Transport service makes redundant copies of all messages in transit. This feature is known as *shadow redundancy*.

- The transport service makes redundant copies of all delivered messages. This feature is known as *Safety Net*.

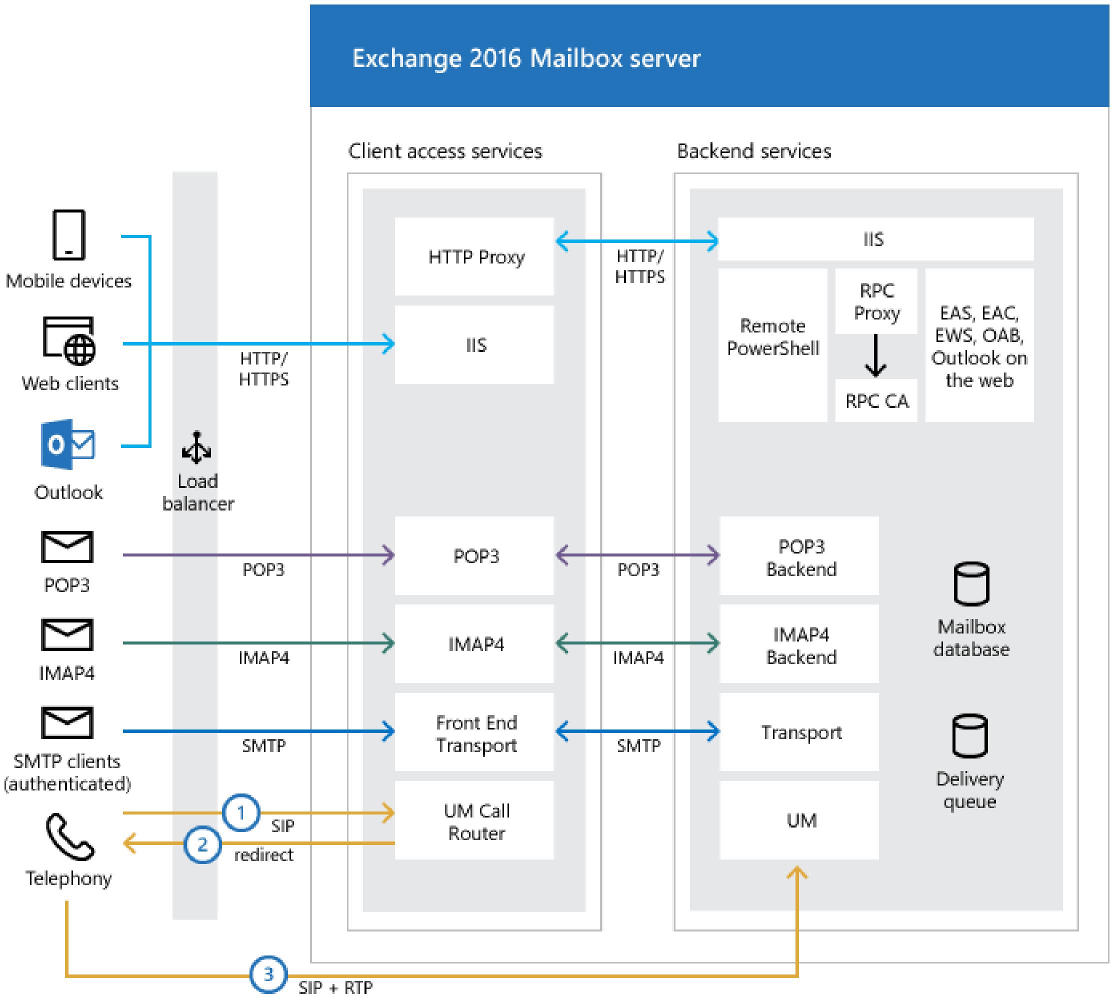
- In Exchange Server, a DAG represents a transport high availability boundary. You can achieve site resilience by spanning a DAG across multiple Active Directory sites.

- In Exchange Server, transport high availability is more than a best effort for message redundancy, because redundancy doesn't depend on supported features of the sending mail server. Therefore, you can say that Exchange Server attempts to guarantee message redundancy by keeping multiple copies of messages during and after delivery.

For more information, see Transport high availability.

Client Access protocol architecture

The Client Access services on Exchange Mailbox servers are responsible for accepting all forms of client connections. The Client Access (frontend) services proxy these connections to the backend services on the destination Mailbox server (the local server or a remote Mailbox server that holds the active copy of the user's mailbox). Clients don't directly connect to the backend services. This communication is shown in the following diagram.



The protocol that's used by a client determines the protocol that's used to proxy the request to the backend services on the destination Mailbox server. For example, if the client connected using HTTP, the Mailbox server uses HTTP to proxy the request to the destination Mailbox server (secured via SSL using a self-signed certificate). If the client used IMAP or POP, then the protocol that's used is IMAP or POP.

In Exchange 2016, telephony requests are different than other client connections. Instead of proxying the request, the Mailbox server *redirects* the request to the Mailbox server that holds the active copy of the user's mailbox. Telephony devices are required to establish their SIP and RTP sessions directly with the Unified Messaging services on the destination Exchange 2016 Mailbox server.

NOTE

Unified Messaging is not available in Exchange 2019.

Exchange architecture changes

- **Server role consolidation**: In Exchange 2013 or earlier, you could install the Client Access server role and the Mailbox server role on separate computers. In Exchange 2016 or later, the Client Access server role is automatically installed as part of the Mailbox server role, and the Client Access server role isn't available as a separate installation option. This change reflects the philosophy of Exchange server role co-location that's been a recommended best practice since Exchange 2010. A multi-role Exchange server architecture gives you the following tangible benefits:
  - All Exchange servers in your environment (with the likely exception of any Edge Transport servers) can be exactly the same: the same hardware, the same configuration, etc. This uniformity simplifies hardware purchasing, and also maintenance and management of the Exchange servers.

  - You'll likely need fewer physical Exchange servers. This results in lower ongoing maintenance costs, fewer Exchange server licenses, and reduced rack, floor space, and power requirements.

  - Scalability is improved, because you're distributing the workload across a greater number of physical machines. During a failure, the load on the remaining Exchange multi-role servers increases only incrementally, which ensures the other functions on the Exchange servers aren't adversely affected.

  - Resiliency is improved, because a multi-role Exchange server can survive a greater number of Client Access role (or service) failures and still provide service.

- **Search improvements**: The local search instance is now able to read data from the local mailbox database copy. As a result, passive search instances no longer need to coordinate with their active counterparts to perform index updates, and bandwidth requirements between the active copy and a passive copy have been reduced by 40% compared to previous versions of Exchange. Also, search is now able to perform multiple asynchronous disk reads prior to a user completing a search term. This populates the cache with relevant information, and provides sub-second search query latency for online clients like Outlook on the web.

- **Office Online Server Preview for Outlook on the web document preview**: In Exchange 2013 or earlier, Outlook Web App included WebReady Document Viewing for the built-in preview of Office and PDF documents. In Exchange 2016 or later, Outlook on the web uses Office Online Server Preview to provide rich preview and editing capabilities for documents. While this provides a consistent document experience with other products like SharePoint and Skype for Business, it does require you to deploy Office Online Server Preview in your on-premises environment if you don't already have it. For more information, see Install Office Online Server in an Exchange organization.

- **MAPI over HTTP is the default for Outlook connections**: MAPI over HTTP was introduced in Exchange 2013 Service Pack 1, and offers improvements over the traditional Outlook Anywhere (RPC over HTTP) connection method. In Exchange 2016 or later, MAPI over HTTP is enabled by default, and offers additional controls, such as the ability to enable or disable MAPI over HTTP per user, and whether to advertise it to external clients. For more information, see MAPI over HTTP in Exchange Server.

Mailbox servers

8/3/2020 • 2 minutes to read • Edit Online

In Microsoft Exchange Server 2010, the Mailbox server role hosted both mailbox and public folder databases and also provided email message storage. In Exchange Server 2016 and Exchange Server 2019, the Mailbox server role contains transport services for routing mail, mailbox databases, Client access services to accept client connections, and (in Exchange 2016 only) Unified Messaging (UM) components.

For more information about Exchange mailbox servers and how they complement other server roles, see Exchange architecture.

Managing Mailbox servers

The following articles contain procedures for common Mailbox server management tasks:

- Manage mailbox databases in Exchange Server
- Manage on-premises mailbox moves in Exchange Server
- Prepare mailboxes for cross-forest move requests
- Enable the MRS Proxy endpoint for remote moves

Manage mailbox databases in Exchange Server

8/3/2020 • 8 minutes to read • Edit Online

A mailbox database is a unit of granularity where mailboxes are created and stored. A mailbox database is stored as an Exchange database (.edb) file. In Exchange 2016 and 2019, each mailbox database has its own properties that you can configure.

What do you need to know before you begin?

- Estimated time to complete each procedure: 10 minutes
- To open the Exchange admin center (EAC), see Exchange admin center in Exchange Server. To open the Exchange Management Shell, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mailbox databases" entry in the Recipients Permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Create a mailbox database

Use the EAC to create a mailbox database

1. From the Exchange admin center (EAC), navigate to **Servers**.
2. Select **Databases**, and then click the + symbol to create a database.
3. Use the new database wizard to create your database.

Use the Exchange Management Shell to create a mailbox database

For an example of how to create a mailbox database, see Example 1 in New-MailboxDatabase.

How do you know this worked?

To verify that you have successfully created a database, do the following:

- From the EAC, verify that the mailbox database you created is listed on the **Databases** page.
- From the Exchange Management Shell, verify that the database was created on server Mailbox01 by running the following command.

```
Get-MailboxDatabase -Server "Mailbox01"
```

Get mailbox database properties

For detailed syntax and parameter information, see Get-MailboxDatabase.

Use the Exchange Management Shell to get mailbox database properties

For an example of how to get mailbox database properties, see Example 3 in Get-MailboxDatabase.

How do you know this worked?

To verify that you have successfully retrieved your mailbox database information, do the following:

- From the Exchange Management Shell, verify that all your mailbox database information is represented correctly.

Set mailbox database properties

Use the EAC to set mailbox database properties

1. From the EAC, navigate to **Servers**.

2. Select **Databases**, and then click to select the mailbox database you want to configure.

3. Click **Edit** ✎ to configure the attributes of a mailbox database.

4. Use the **General** tab to view status about the mailbox database, including the mailbox database path, last backup, and mailbox database status:

   - **Database path**: This read-only field displays the full path to the Exchange database (.edb) file for the selected mailbox database. To view the entire path, you may have to click the path and use the Right Arrow key. You can't use this field to change the path. To change the location of the database files, use the Move-DatabasePath cmdlet.

   - **Last full backup**: This read-only field displays the date and time of the last complete backup of the mailbox database.

   - **Last incremental backup**: This read-only field displays the date and time of the last incremental backup of the mailbox database.

   - **Status**: This read-only field displays whether the mailbox database is mounted or dismounted.

   - **Mounted on server**: This read-only field displays which server the database is mounted on.

   - **Master**: This read-only field displays the master server for the mailbox database. The Mailbox server that hosts the active copy of a database is referred to as the mailbox database master.

   - **Master type**: This read-only field displays the type of mailbox database master.

   - **Modified**: This read-only field displays the date and time the database was last modified.

   - **Servers hosting a copy of this database**: This read-only field displays the other servers that have a copy of this database.

5. Use the **Maintenance** tab to configure mailbox database settings, including specifying a journal recipient, setting a maintenance schedule, and mounting the database at startup:

   - **Journal Recipient**: Click **Browse** to specify a recipient to enable journaling on this mailbox database. Remove the recipient listed to disable journaling.

   - **Maintenance schedule**: Use this list to select one of the preset maintenance schedules. You can also configure a custom schedule. To configure a custom schedule, click **Customize**.

   - **Enable background database maintenance (24 x 7 ESE scanning)**: Select this check box to enable online database scanning, which runs continuously in the background. Online database scanning performs a checksum calculation of the database and performs operations that allow Exchange to scan for lost space on the database and recover it. If you select this check box, Exchange scans the database no more than one time per day and will issue a warning event if it can't finish scanning the database in a seven-day period.

- **Don't mount this database at startup**: Select this check box to prevent Exchange from mounting this mailbox database when it starts.
- **This database can be overwritten by a restore**: Select this check box to allow the mailbox database to be overwritten during a restore process.
- **Enable circular logging**: Select this check box to enable circular logging.

6. Use the **Limits** tab to specify the storage limits, the warning message interval, and the deletion settings for a mailbox database:

   - **Issue warning at (GB)**: Select this check box to automatically warn mailbox users that their mailbox is approaching its storage limit. To specify the storage limit, select the check box, and then specify in gigabytes (GB) how much content can be stored in the mailbox before a warning email message is sent to the mailbox users. You can enter a value from 0 through 2,097,151 megabytes (MB) (2.0 terabytes).
   - **Prohibit send at (GB)**: Select this check box to prevent users from sending new email messages after the size of their mailbox reaches the specified limit. To specify this limit, select the check box, and then type the size of the mailbox in GB at which you want to prohibit the sending of new email messages and notify the user. You can enter a value from 0 through 2,097,151 MB (2.0 terabytes).
   - **Prohibit send and receive at (GB)**: Select this check box to prevent users from sending and receiving email messages after their mailbox size reaches the specified limit. To specify this limit, select the check box, and then type the size of the mailbox in GB at which you want to prohibit the sending and receiving of email messages and notify the user. You can enter a value from 0 through 2,097,151 MB (2.0 terabytes).
   - **Keep deleted items for (days)**: Select this check box to set the number of days that deleted items are retained in a mailbox. You can enter a value from 0 through 24,855 days.
   - **Keep deleted mailboxes for (days)**: Select this check box to set the number of days that deleted mailboxes are retained. You can enter a value from 0 through 24,855 days.
   - **Don't permanently delete items until the database has been backed up**: Select this check box to prevent mailboxes and email messages from being deleted until after the mailbox database has been backed up.

7. Use the **Client Settings** tab to select the offline address book (OAB) for the mailbox:

   - **Offline address book**: To select an offline address book, click **Browse**, and then select the offline address book.

Use the Exchange Management Shell to set mailbox database properties

For an example of how to set mailbox database properties, see Example 1 in Set-MailboxDatabase.

How do you know this worked?

To verify that you have successfully set the attributes, do the following:

- Verify that your changes are saved in the EAC.
- From the Exchange Management Shell, run the following command to retrieve mailbox database properties.

  ```
  Get-MailboxDatabase -Identity MailboxDatabase01 -Status | Format-List
  ```

Move a mailbox database path

For detailed syntax and parameter information, see Move-DatabasePath.

Use the Exchange Management Shell to move a mailbox database path

For an example of how to set mailbox database properties, see Example 1 in Move-DatabasePath.

How do you know this worked?

To verify that you have successfully moved the database path, do the following:

1. From the EAC, select **Servers** > **Databases**, and then click to select the appropriate mailbox.

2. Click the **pen** symbol and verify that the database path is correct.

Mount a mailbox database

For detailed syntax and parameter information, see Mount-Database.

Use the Exchange Management Shell to mount a mailbox database

For an example of how to mount a mailbox database, see Example 1 in Mount-Database.

How do you know this worked?

To verify that you have successfully mounted the mailbox database, do the following.

- From the Exchange Management Shell, run the following command to retrieve mailbox database properties for all mailbox databases.

```
Get-MailboxDatabase -IncludePreExchange2013
```

Dismount a mailbox database

For detailed syntax and parameter information, see Dismount-Database.

Use the Exchange Management Shell to dismount a mailbox database

For an example of how to dismount a mailbox database, see Example 1 in Dismount-Database.

How do you know this worked?

To verify that you have successfully dismounted the database, do the following:

1. From EAC, select **Servers** > **Databases**, and then click to select the appropriate mailbox.

2. Click the **pen** symbol, and verify that the database status is **Dismounted**.

Remove a mailbox database

Use the EAC to remove a mailbox database

1. From the EAC, select **Servers** > **Databases**, and then click to select the appropriate mailbox.

2. Click **Delete** 🗑 to remove the mailbox database.

Use the Exchange Management Shell to remove a mailbox database

For detailed syntax and parameter information, see Remove-MailboxDatabase.

1. Run the following command to remove the mailbox database MyDatabase.

```
Remove-MailboxDatabase -Identity "MyDatabase"
```

2. When you're prompted about whether you're sure that you want to perform the action, type **Y**.

3. When the dialog box appears stating that the database was removed successfully, note the location of the Exchange database (.edb) file. If you want to remove this file from the hard drive, you must remove it manually.

How do you know this worked?

To verify that you have successfully removed the mailbox database, do the following:

- From the EAC, select **Servers** > **Databases**.

- Verify that the mailbox database has been removed.

Manage on-premises mailbox moves in Exchange Server

8/3/2020 • 12 minutes to read • Edit Online

In Exchange Server, users' primary mailboxes and archive mailboxes can reside on different databases. A *move request* is the process of moving a mailbox from one mailbox database to another. A *local move request* is a mailbox move that occurs within a single Active Directory forest (as opposed to a remote move request that occurs between Active Directory forests). You use the procedures in this topic for local move requests of primary mailboxes, archive mailboxes, or both in on-premises. Using the move request functionality, you can move the primary mailbox and the associated archive to the same database or to separate ones.

The following two services process your move request to move mailboxes:

- Exchange Mailbox Replication service (MRS)
- Exchange Mailbox Replication Proxy

The procedures in this topic will help you with on-premises mailbox moves. You can use the Exchange Management Shell and the Exchange admin center (EAC) to move mailboxes in your on-premises organization.

For more information about the Mailbox replication service and proxy, see Learn more about MRS Proxy. For more information about mailbox moves, see Mailbox moves in Exchange Server.

What do you need to know before you begin?

- Estimated time to complete each procedure: 20 minutes
- For more information about accessing and using the EAC, see Exchange admin center in Exchange Server. To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mailbox Move and Migration Permissions " entry in Recipients Permissions.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

TIP

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Create local move requests

You can create local move requests for:

- A single mailbox.
- Multiple mailboxes (also known as a *batch move request*).
- Multiple mailboxes that you specify in a comma-separated value (CSV) file (also known as a *migration batch*).

When you create local move requests in the EAC (for a single mailbox, multiple mailboxes, or multiple mailboxes specified in a CSV file), the request is visible to the **Get-MigrationBatch** cmdlet in the Exchange Management Shell. When the request has been completed (automatically or manually), the results for each individual mailbox are visible to the **Get-MoveRequest** cmdlet.

To create new local move requests in the Exchange Management Shell, you only use the **New-MigrationBatch** cmdlet for migration batches (the mailboxes are specified in a CSV file). To create local move requests that don't use a CSV file (individual mailboxes or batch move requests), you need to use the **New-MoveRequest** cmdlet, and these requests aren't visible to the **Get-MigrationBatch** batch cmdlet (or related ***-MigrationBatch*** cmdlets).

Use the EAC to create a local move request

1. In the EAC, go to **Recipients** > **Migration** > click **Add** +, and then select **Move to a different database**.

2. The **New local mailbox move** wizard opens. On the **Select users** page, configure one of these options:

   - **Select the users that you want to move**: Select one or more users:

     Note: Even if you're only interested in moving a user's archive mailbox, you select the user's primary mailbox.

     - Click **Add** +. In the **Select Mailbox** dialog box that appears, select one ore more mailboxes. When you're finished, click **OK**.

     - To remove mailboxes from the list, select the mailbox, and then click **Remove** −.

   - **Specify the users with a CSV file**: Click **Browse** and go to the location of the comma-separated value (CSV) file that specifies the mailboxes to move. For more information about the CSV file requirements for local move requests, see CSV Files for Mailbox Migration.

   - **Allow unknown columns in the CSV file**:

     - If you leave this check box unselected, move will ignore (silently skip) unknown columns in the CSV file (including optional columns with misspelled column headers). All unknown columns are treated like extra columns that aren't used.

     - If you select this check box, the migration fails if there are any unknown columns in the CSV file. This setting protects against spelling errors in the required and optional column headers, but the CSV file can't contain any unrelated columns.

   When you're finished, click **Next**.

3. On the **Move configuration** page, configure these settings:

   - **New migration batch name**: Enter a descriptive name for the mailbox move operation.

   - **Archive**: Select one of these options:

     - **Move the primary mailbox and the archive mailbox if one exists**

     - **Move primary mailbox only, without moving archive mailbox**

     - **Move archive mailbox only, without moving primary mailbox**

   - **Target database**: This setting affects moves for primary mailboxes.

     - To specify the database for the primary mailbox, click **Browse**. In the **Select Mailbox Database** dialog box that appears, select the database.

     - If you don't specify a database, the automatic distribution logic in Exchange will randomly select a database in the Active Directory site.

   - **Target archive database**: This setting affects moves for archive mailboxes.

     - To specify the database for the archive mailbox, click **Browse**. In the **Select Mailbox Database** dialog box that appears, select the database.

     - If you don't specify a database, the archive mailbox is moved to the same location as the primary mailbox.

   - **Bad item limit**: Specifies the maximum number of corrupted items that are allowed in the mailbox before the request fails. The default value in the EAC is 10. Don't specify a value greater than 50 here. If you want to set the limit to 51 or higher, use the *BadItemLimit* parameter and the *AcceptLargeDataLoss* switch in the Exchange Management Shell.

   When you're finished, click **Next**.

4. On the **Start the batch** page, configure these settings:

   - **After the batch is complete, a report will be sent to the following recipients.**: The default value is the account that you're using to move the mailboxes. Click **Browse** to add or remove recipients. When you're finished, click **OK**.

   - **Please select the preferred option to start the batch**: Select one of these options:

   - **Manually start the batch later**

   - **Automatically start the batch**: This is the default value.

   - **Please select the preferred option to complete the batch**: Select one of these options:

   - **Manually complete the batch**

   - **Automatically complete the migration batch**: This is the default value.

   When you're finished, click **New**.

Use the Exchange Management Shell to create a local move request for individual or multiple mailboxes

A local move request for an individual mailbox uses the **New-MailboxMove** cmdlet. But, a local move request for multiple mailboxes that doesn't specify the mailboxes in a CSV file also uses the **New-MailboxMove** cmdlet. A local move request for multiple mailboxes that doesn't use a CSV file is also known as a *batch move request*.

To create a local move request for an individual mailbox, use this syntax:

```
New-MoveRequest "<DescriptiveName>"] -Identity <MailboxIdentity> [<-ArchiveOnly | -PrimaryOnly>] [-
TargetDatabase <DatabaseIdentity>] [-ArchiveTargetDatabase<DatabaseIdentity>] [-Priority <PriorityValue>] [-
BadItemLimit <Value>] [-AcceptLargeDataLoss]
```

This example creates a new local move request with these settings:

- **Mailbox**: The primary mailbox and archive mailbox (if it exists) for Angela Gruber (agruber@contoso.com). If you only want to move the primary mailbox, use the *PrimaryOnly* switch. If you only want to move the archive mailbox, use the *ArchiveOnly* switch.

- **Target database for the primary mailbox**: MBX DB02. If we don't use the *TargetDatabase* parameter, the automatic distribution logic in Exchange will randomly select a database in the Active Directory site.

- **Target database for the archive mailbox**: MBX DB03. If we don't use the *ArchiveTargetDatabase* parameter or the *PrimaryOnly* switch, the archive mailbox database will be moved to the same database as the primary mailbox.

  If we use the *ArchiveOnly* switch without using the *ArchiveTargetDatabase* parameter, the automatic distribution logic in Exchange will randomly select a database in the Active Directory site.

- **Priority**: `Normal`, because we aren't using the *Priority* parameter.

- **Bad item limit**: 10 (the default value in the Exchange Management Shell is 0). Because the value is less than 51, we don't need to use the `AcceptLargeDataLoss` switch.

```
New-MoveRequest -Identity agruber@contoso.com -TargetDatabase "MBX 02" -ArchiveTargetDatabase "MBX 03" -
BadItemLimit 10
```

This example uses similar settings, but only moves Angela's primary mailbox.

```
New-MoveRequest -Identity agruber@contoso.com -PrimaryOnly-TargetDatabase "MBX 02" -BadItemLimit 10
```

This example uses similar settings, but only moves Angela's archive mailbox.

```
New-MoveRequest -Identity agruber@contoso.com -ArchiveOnly -ArchiveTargetDatabase "MBX 03" -BadItemLimit 10
```

For detailed syntax and parameter information, see New-MoveRequest.

A batch move request uses virtually the same syntax as a move request for an individual mailbox. The main differences are:

- You don't use the *Identity* parameter to specify the mailbox. Instead, you use the **Get-Mailbox** or **Get-User** cmdlets to generate the list of mailboxes that you want to move, and you pipeline the results to the **New-MoveRequest** cmdlet.

- You name the batch move with the *BatchName* parameter.

This example creates a batch move request with these settings:

- **Mailboxes to move**: All mailbox on the database named MBX DB01.

- **Batch name**: MBX DB01 to MBX DB02.

- **Target database**: MBX DB02. If we didn't use the *TargetDatabase* parameter, the automatic distribution logic in Exchange would randomly select databases in the Active Directory site.

- **Target database for archive mailboxes**: MBX DB02. Because we aren't using the *ArchiveTargetDatabase* parameter or the *PrimaryOnly* switch, the archive mailbox database is moved to the same database as the primary mailbox.

  If we use the *ArchiveOnly* switch without using the *ArchiveTargetDatabase* parameter, the automatic distribution logic in Exchange will randomly select databases in the Active Directory site.

- **Priority**: `High`

- **Bad item limit**: 51 (the default value in the Exchange Management Shell is 0), so we also need to use the *AcceptLargeDataLoss* switch.

```
Get-Mailbox -Database "MBX DB01" | New-MoveRequest -BatchName "MBX DB01 to MBX DB02" -TargetDatabase "MBX
DB02" -Priority High -BadItemLimit 51 -AcceptLargeDataLoss
```

For detailed syntax and parameter information, see New-MoveRequest.

Use the Exchange Management Shell to create a local move request from a CSV file

A local move request for mailboxes that are specified in a CSV file is known as a *migration batch*, and uses the **New-MigrationBatch** cmdlet.

For more information about the CSV file requirements for local move requests, see CSV Files for Mailbox Migration.

NOTE

All mailboxes that are specified in the CSV file will be migrated, even if they are outside of the RBAC scope (for example, an OU) that gives the admin permissions to migrate mailboxes.

To create a migration batch, use this syntax:

```
New-MigrationBatch -Local [-AutoStart] [-AutoComplete] -Name "<MigrationBatchName>" -CSVData ([Byte[]](Get-Content -Encoding Byte -Path "<PathAndFileName>" -ReadCount 0)) [<-ArchiveOnly | -PrimaryOnly>] [-TargetDatabases "<MailboxDatabase1>","<MailboxDatabase1>"... [-TargetArchiveDatabases "<MailboxDatabase1>","<MailboxDatabase1>"...] [-Priority <PriorityValue>] [-BadItemLimit <Value>] [-AcceptLargeDataLoss]
```

This example creates a migration batch with these settings:

- **CSV file that specifies the mailboxes to move**: C:\Users\Administrator\Desktop\LocalMove 01.csv. If you only want to move the primary mailbox, use the *PrimaryOnly* switch, or the **MailboxType** value `PrimaryOnly` in the CSV file. If you only want to move the archive mailbox, use the *ArchiveOnly* switch, or the **MailboxType** value `ArchiveOnly` in the CSV file.

- **Batch name**: LocalMove 01.

- **Target database**: MBX DB02. If we don't use the *TargetDatabase* parameter, and the primary mailbox databases aren't specified in the CSV file, the automatic distribution logic in Exchange randomly selects databases in the Active Directory site.

- **Target database for archive mailboxes**: MBX DB02. Because we aren't using the *ArchiveTargetDatabase* parameter (in the command or the CSV file), the archive mailbox database is moved to the same database as the primary mailbox.

  If we use the *ArchiveOnly* switch (in the command or CSV file) without using the *ArchiveTargetDatabase* parameter (in the command or CSV file), the automatic distribution logic in Exchange will randomly select databases in the Active Directory site.

- **When to start the migration**: Immediately, because we're using the *AutoStart* switch. If we don't use this switch, we need to use the **Start-MigrationBatch** cmdlet to start the migration batch after it's created.

- **When to complete the migration**: After the mailboxes complete their initial synchronization, because we're using the *AutoComplete* switch. If we don't use this switch, we need to use the **Complete-MigrationBatch** cmdlet to start the migration batch after it's created

- **Priority**: `Normal`, because we aren't using the *Priority* parameter.

- **Bad item limit**: 10 (the default value in the Exchange Management Shell is 0). Because the value is less than 51, we don't need to use the `AcceptLargeDataLoss` switch.

```
New-MigrationBatch -Local -AutoStart -AutoComplete -Name "LocalMove 01" -CSVData ([System.IO.File]::ReadAllBytes("C:\Users\Administrator\Desktop\LocalMove 01.csv")) -TargetDatabases "MBX DB02" -BadItemLimit 10
```

How do you know this worked?

To verify that you've successfully created a local move request, do any of these steps:

- In the EAC, go to **Recipients** > **Migration** and verify the status of the move request (note that you might need to click **Refresh** ⟳). You can select the move request, and see more information in the details pane, or by clicking **Edit** ✎.
- In the EAC, go to **Recipients** > **Migration** and click **Status For All Batches**.
- Check the notification message. The sender is Microsoft Outlook. When the move request is complete, you'll get a message with the subject `Migration batch <MigrationBatchName> has completed successfully`.
- In the EAC, click the notification viewer 🔔 to view the status of the request.
- In the Exchange Management Shell, replace *<MailboxIdentity>* with the name, email address, or alias of the mailbox, and run this command to verify the basic property values:

  ```
  Get-MoveRequest -Identity <MailboxIdentity> | Format-List DisplayName,Alias,Status,*database*
  ```

- In the Exchange Management Shell, replace *<BatchName>* with the batch name value of the move request, and run this command to verify the basic property values:

  ```
  Get-MoveRequest -BatchName <BatchName> | Format-List DisplayName,Alias,Status,*database*
  ```

  Note: If you created the move request in the EAC, the batch name value is `MigrationService:<BatchNameValueFromTheEAC>`.

- If you created the move request in the EAC, replace *<BatchName>* with the batch name value you specified, and run this command in the Exchange Management Shell to verify summary information about all mailboxes in the move:

  ```
  Get-MigrationUserStatistics -BatchId <BatchName>
  ```

- If you created the move request in the EAC, replace *<EmailAddress>* with the email address of the moved mailbox, and run this command to see detailed information about the specified mailbox:

  ```
  Get-MigrationUserStatistics -Identity <EmailAddress> | Format-List
  ```

For more information, see Get-MigrationUserStatistics.

Display migration batches

For an example of how to use the Exchange Management Shell to display a migration batch, see Example 2 in Get-MigrationBatch.

Create a cross-forest move using a .csv batch file

This example configures the migration endpoint, and then creates a cross-forest batch move from the source forest to the target forest using a .csv file.

```
New-MigrationEndpoint -Name Fabrikam -ExchangeRemote -Autodiscover -EmailAddress tonysmith@fabrikam.com -
Credentials (Get-Credential fabrikam\tonysmith)
$csvData=[System.IO.File]::ReadAllBytes("C:\Users\Administrator\Desktop\batch.csv")
New-MigrationBatch -CSVData $csvData -Timezone "Pacific Standard Time" -Name FabrikamMerger -SourceEndpoint
Fabrikam -TargetDeliveryDomain "mail.contoso.com"
```

For more information about preparing your forest for cross-forest moves, see the following topics:

- Prepare mailboxes for cross-forest move requests
- Prepare Mailboxes for Cross-Forest Moves Using Sample Code
- Prepare mailboxes for cross-forest moves using the Exchange Management Shell

For detailed syntax and parameter information, see New-MigrationBatch and New-MoveRequest.

How do you know this worked?

To verify that you have successfully completed your migration, do the following:

- From the Exchange Management Shell, run the following command to retrieve mailbox move information.

  ```
  Get-MigrationUserStatistics -Identity BatchName -Status | Format-List
  ```

For more information, see Get-MigrationUserStatistics.

Prepare mailboxes for cross-forest move requests

8/3/2020 • 11 minutes to read • Edit Online

Mailbox moves and mailbox migrations in Exchange 2016 and Exchange 2019 from one forest to another require that you prepare the destination forest, which is made easier by Exchange tools and cmdlets. Exchange 2016 supports mailbox moves and migrations using the Exchange Management Shell, specifically the **New-MoveRequest** and **New-MigrationBatch** cmdlets. You can also move the mailbox in the Exchange admin center (EAC).

To move an Exchange mailbox from a source forest to the target Exchange 2016 or Exchange 2019 target forest, the target forest needs to contain a valid mail user (also known as a mail-enabled user) with a specified set of Active Directory attributes.

- In Exchange 2016, you can move an Exchange 2010, Exchange 2013, or Exchange 2016 mailbox from a source Exchange forest to a target Exchange 2016 forest. If there's at least one Exchange 2016 Mailbox server in the target forest, the forest is considered an Exchange 2016 forest.

- In Exchange 2019, you can move an Exchange 2013, Exchange 2016, or Exchange 2019 mailbox from a source Exchange forest to a target Exchange 2019 forest. If there's at least one Exchange 2019 Mailbox server in the target forest, the forest is considered an Exchange 2019 forest.

To prepare for the mailbox move, you need to create mail users (also known as mail-enabled users) with the required Active Directory attributes in the target forest. There are two recommended approaches for creating mail users with the necessary attributes:

- If you deployed Identity Lifecycle Manager (ILM) for cross-forest global address list (GAL) synchronization, we recommend that you use Microsoft Identity Manager 2016 Service Pack 1. We've created sample code that you can use to learn how to customize ILM to synchronize the source mailbox user and target mail user.

  For more information, including how to download the sample code, see Prepare mailboxes for cross-forest moves using sample code.

- If you created the target mail user using an Active Directory tool other than ILM or Microsoft Identity Integration Server (MIIS), use the **Update-Recipient** cmdlet with the *Identity* parameter to generate the **LegacyExchangeDN** attribute for the target mail user. We've created a sample PowerShell script that reads from and writes to Active Directory and calls the **Update-Recipient** cmdlet.

  For more information about using the sample script, see Prepare mailboxes for cross-forest moves using the Exchange Management Shell.

After creating the target mail user, you can then run the **New-MoveRequest** or the **New-MigrationBatch** cmdlets to move the mailbox to the target Exchange 2016 or Exchange 2019 forest.

For more information about remote move requests, see the following topics:

- New-MigrationBatch

- New-MoveRequest

The remainder of this topic describes the mail user Active Directory attributes that are required for a mailbox move. These attributes are configured for you when you use either the code or the script to prepare for the mailbox move. However, you can manually copy these attributes using an Active Directory editor.

Active Directory user attributes required for a mailbox move

To support a remote mailbox move, the mail user object in the target Exchange forest must have the Active Directory attributes that are described in this section:

- Mandatory attributes
- Optional attributes
- Linked attributes
- Linked user attributes
- Resource mailbox attributes
- Additional attributes

Mandatory attributes

The following table lists the minimum set of attributes that need to be configured in ILM on the target mail user for the **New-MoveRequest** cmdlet to function correctly.

Mail user attributes

ACTIVE DIRECTORY ATTRIBUTE	ACTION
displayName	Copy the corresponding attribute of the source mailbox or generate a new value.
Mail	Directly copy the corresponding attribute of the source mailbox.
mailNickname	Copy the corresponding attribute of the source mailbox or generate a new value.
msExchArchiveGUID and msExchArchiveName	Directly copy the corresponding attribute of the source mailbox.
msExchMailboxGUID	Directly copy the corresponding attribute of the source mailbox.
msExchRecipientDisplayType	-2147483642 decimal (equivalent to 0x80000006 hex).
msExchRecipientTypeDetails	128 decimal (0x80 hex).
msExchUserCulture	Directly copy the corresponding attribute of the source mailbox.
msExchVersion	44220983382016 (decimal).
cn	Copy the corresponding attribute of the source mailbox or generate a new value.

ACTIVE DIRECTORY ATTRIBUTE	ACTION
proxyAddresses	Copy source mailbox's **proxyAddresses** attribute. Additionally, copy source mailbox's **LegacyExchangeDN** as an X500 address in the **proxyAddresses** attribute of the target mail user. **Note**: The **proxyAddresses** of the source mailbox user must contain an SMTP address that matches the authoritative domain of the target forest. This allows the **New-MoveRequest** cmdlet to correctly select the **targetAddress** of the source mail-enabled user (converted from the source mailbox user after the mailbox move request is complete) to ensure that mail routing is still functional.
sAMAccountName	Copy the corresponding attribute of the source mailbox or generate a new value. Ensure that the value is unique within the target forest domain that the target mail user belongs to.
targetAddress	Set to an SMTP address in the **proxyAddresses** attribute of the source mailbox. This SMTP address must belong to the authoritative domain of the source forest.
userAccountControl	Constant: 514 (equivalent to 0x202, ACCOUNTDISABLE | NORMAL_ACCOUNT).
userPrincipalName	Copy the corresponding attribute of the source mailbox or generate a new value. Because the mail user is logon disabled, this **userPrincipalName** isn't used.

Optional attributes

The following attributes aren't required for the **New-MoveRequest** cmdlet to function correctly; however, synchronizing them provides a better end-to-end user experience after moving the mailbox. Because the GAL in the target forest displays this target mail user, you should set the following GAL-related attributes.

GAL-related attributes

MAIL USER'S ACTIVE DIRECTORY ATTRIBUTE	ACTION
c	Directly copy the corresponding attribute of the source mailbox.
co	Directly copy the corresponding attribute of the source mailbox.
countryCode	Directly copy the corresponding attribute of the source mailbox.
company	Directly copy the corresponding attribute of the source mailbox.
department	Directly copy the corresponding attribute of the source mailbox.
facsimileTelephoneNumber	Directly copy the corresponding attribute of the source mailbox.

MAIL USER'S ACTIVE DIRECTORY ATTRIBUTE	ACTION
givenName	Directly copy the corresponding attribute of the source mailbox.
homePhone	Directly copy the corresponding attribute of the source mailbox.
info	Directly copy the corresponding attribute of the source mailbox.
initials	Directly copy the corresponding attribute of the source mailbox.
l	Directly copy the corresponding attribute of the source mailbox.
mobile	Directly copy the corresponding attribute of the source mailbox.
msExchAssistantName	Directly copy the corresponding attribute of the source mailbox.
msExchHideFromAddressLists	Directly copy the corresponding attribute of the source mailbox.
otherHomePhone	Directly copy the corresponding attribute of the source mailbox.
otherTelephone	Directly copy the corresponding attribute of the source mailbox.
pager	Directly copy the corresponding attribute of the source mailbox.
physicalDeliveryOfficeName	Directly copy the corresponding attribute of the source mailbox.
postalCode	Directly copy the corresponding attribute of the source mailbox.
sn	Directly copy the corresponding attribute of the source mailbox.
st	Directly copy the corresponding attribute of the source mailbox.
streetAddress	Directly copy the corresponding attribute of the source mailbox.
telephoneAssistant	Directly copy the corresponding attribute of the source mailbox.
telephoneNumber	Directly copy the corresponding attribute of the source mailbox.

MAIL USER'S ACTIVE DIRECTORY ATTRIBUTE	ACTION
title	Directly copy the corresponding attribute of the source mailbox.

Linked attributes

A *linked attribute* is an Active Directory attribute that references other Active Directory objects in the local forest. You can't directly copy the linked attribute values from a mailbox in the source forest to a mail user in the target forest. Instead, you do the following steps:

1. Find the Active Directory objects in the source forest that the source mailbox attribute refers to.
2. Find the corresponding Active Directory objects in the target forest.
3. Set the target mail user's attribute to refer to the Active Directory objects in the target forest.

Linked attributes

MAIL USER'S ACTIVE DIRECTORY ATTRIBUTE	ACTION
altRecipient	Correspond to the source mailbox's **altRecipient** attribute.
deliverAndRedirect	Directly copy the corresponding attribute of the source mailbox. This attribute is a Boolean value that should be set along with **altRecipient**.
Manager (and its backlinks)	Correspond to the source mailbox's manager attribute.
MemberOf (backlinks)	This is the backlink of group member attribute.
publicDelegates (and its backlinks)	Correspond to the source mailbox's **publicDelegates** attribute.

Linked user attributes

If you want to move a mailbox to an Exchange resource forest, the mailbox in the resource forest is considered a *linked mailbox*. In this scenario, you need to create a linked mail user in the (target) resource forest. To create a linked mail user, you need to set the attributes shown in the following table.

Linked mail user attributes

ACTIVE DIRECTORY ATTRIBUTE	ACTION
msExchMasterAccountHistory	Directly copy the corresponding attribute of the source mailbox.
msExchMasterAccountSid	If the source mailbox has **msExchMasterAccountSid**, copy it. Otherwise, copy the source mailbox's **objectSid**.
msExchRecipientDisplayType	Constant:-1073741818 decimal (equivalent to `*unsigned* 0xC0000006`).

> **NOTE**
>
> A linked mailbox can only be created if there's a forest trust between the source forest and target forest.

If the source object is disabled and the **msExchMasterAccountSid** attribute is set to self (resource mailbox, shared mailbox), don't stamp anything on the target user.

If the source object is disabled and the **msExchMasterAccountSid** attribute isn't set, the mailbox is invalid.

If the source object is enabled and the **msExchMasterAccountSid** attribute is set, the mailbox is invalid.

Resource mailbox attributes

If you want to move a resource mailbox to an Exchange forest, you need to set the attributes shown in the following table on the target mail user.

Resource mailbox attributes

MAIL USER'S ACTIVE DIRECTORY ATTRIBUTE	ACTION
msExchRecipientDisplayType	If the source mailbox is a conference room: Constant: -2147481850 decimal (equivalent to `*unsigned* 0x80000706`). If the source mailbox is an equipment mailbox: Constant: -2147481594 decimal (equivalent to `*unsigned* 0x80000806`).
msExchResourceCapacity	Directly copy the corresponding attribute of the source mailbox.
msExchResourceDisplay	Directly copy the corresponding attribute of the source mailbox.
msExchResourceMetaData	Directly copy the corresponding attribute of the source mailbox.
msExchResourceSearchProperties	Directly copy the corresponding attribute of the source mailbox.

Additional attributes

Resource mailbox attributes

MAIL USER'S ACTIVE DIRECTORY ATTRIBUTES	DESCRIPTION
comment	Directly copy the corresponding attribute of the source mailbox.
deletedItemFlags	Directly copy the corresponding attribute of the source mailbox.
delivContLength	Directly copy the corresponding attribute of the source mailbox.
departmentNumber	Directly copy the corresponding attribute of the source mailbox.
description	Directly copy the corresponding attribute of the source mailbox.
division	Directly copy the corresponding attribute of the source mailbox.

MAIL USER'S ACTIVE DIRECTORY ATTRIBUTES	DESCRIPTION
employeeID	Directly copy the corresponding attribute of the source mailbox.
employeeNumber	Directly copy the corresponding attribute of the source mailbox.
employeeType	Directly copy the corresponding attribute of the source mailbox.

Prepare mailboxes for cross-forest moves using the Exchange Management Shell

8/3/2020 • 8 minutes to read • Edit Online

Exchange Server supports mailbox moves and migrations using the Exchange Management Shell **New-MoveRequest** and **New-MigrationBatch** cmdlets. You can also move the mailbox in the Exchange admin center (EAC).

- In Exchange 2016, you can move an Exchange 2010, Exchange 2013, or Exchange 2016 mailbox from a source Exchange forest to a target Exchange 2016 forest.
- In Exchange 2019, you can move an Exchange 2013, Exchange 2016, or Exchange 2019 mailbox from a source Exchange forest to a target Exchange 2019 forest.

To run the **New-MoveRequest** and **New-MigrationBatch** cmdlets, a mail user must exist in the target Exchange forest, and the mail user must have a minimum set of required Active Directory attributes.

The sample Exchange PowerShell script described in this topic supports this task by synchronizing mailbox users from an Exchange source forest to Exchange target forests as mail users (also known as mail-enabled users). The script copies the Active Directory attributes of the mailbox users in the source forest to the target forest, and then uses the **Update-Recipient** cmdlet to turn the target objects into mail users.

For more information about using and writing scripts, see About Scripts. For more information about preparing for cross-forest moves, see Prepare mailboxes for cross-forest move requests.

Looking for other management tasks related to remote move requests? Check out Manage on-premises mailbox moves in Exchange Server.

What do you need to know before you begin?

- Locate the Prepare-MoveRequest.ps1 script in %ExchangeInstallPath%Scripts. By default, %ExcangeInstallPath% is C:\Program Files\Microsoft\Exchange Server\V15\ (note the trailing '\').
- To run the sample script, you need the following:
  - An Exchange source forest (where the mailbox currently resides).
    - For Exchange 2016 target forests, the source mailbox can be in Exchange 2010, Exchange 2013, or Exchange 2016.
    - For Exchange 2019 target forests, the source mailbox can be in Exchange 2013, Exchange 2016, or Exchange 2019.
  - A target forest with Exchange 2016 or Exchange 2019 installed (where the mailbox will be moved to).

> **TIP**

> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the Prepare-MoveRequest.ps1 script to prepare mailboxes for

cross-forest moves

Run the script from the Exchange Management Shell on a Mailbox server in the target Exchange 2016 or Exchange 2019 forest. The script copies the mailbox attributes from the source forest.

To assign a specific authentication credential for the remote forest domain controller, you must first run the Windows PowerShell **Get-Credential** cmdlet and store the user input in a temporary variable. When you run the **Get-Credential** cmdlet, the cmdlet asks for the user name and password of the account used during authentication with the remote forest domain controller. You can then use the temporary variable in the Prepare-MoveRequest.ps1 script. For more information about the **Get-Credential** cmdlet, see Get-Credential.

> **NOTE**
>
> Make sure that you use two separate credentials for the local forest and the remote forest when calling this script.

1. Run the following commands to get the local forest and remote forest credentials.

   ```
   $LocalCredentials = Get-Credential
   ```

   ```
   $RemoteCredentials = Get-Credential
   ```

2. Run the following commands to pass the credential information to the *LocalForestCredential* and *RemoteForestCredential* parameters in the Prepare-MoveRequest.ps1 script.

   ```
   Prepare-MoveRequest.ps1 -Identity JohnSmith@Fabrikan.com -RemoteForestDomainController
   DC001.Fabrikam.com -RemoteForestCredential $RemoteCredentials -LocalForestDomainController
   DC001.Contoso.com -LocalForestCredential $LocalCredentials
   ```

Parameter set of the script

The following table describes the parameter set for the script.

PARAMETER	REQUIRED	DESCRIPTION
Identity	Required	The *Identity* parameter uniquely identifies a mailbox in the source forest. Identity can be any of the following values: Common name (CN), Alias, **proxyAddress** property, **objectGuid** property, or **DisplayName** property
RemoteForestCredential	Required	The *RemoteForestCredential* parameter specifies the administrator who has permissions to copy data from the source forest Active Directory.
RemoteForestDomainController	Required	The *RemoteForestDomainController* parameter specifies a domain controller in the source forest where the mailbox resides.

PARAMETER	REQUIRED	DESCRIPTION
DisableEmailAddressPolicy	Optional	The *DisableEmailAddressPolicy* parameter specifies whether the Email Address Policy (EAP) should be disabled when creating a **MailUser** object in the target forest. When you specify this parameter, the EAP in the target forest won't be applied. **Note**: When you specify this parameter, the **MailUser** object won't have e-mail address mapping in the local forest domain stamped. This is usually stamped by the EAP.
LinkedMailUser	Optional	The *LinkedMailUser* switch specifies whether to create a linked MailUser in the local forest for the mailbox user in the remote forest. If the switch is provided, the script creates a target **MailUser** object linked to the source mailbox. If the switch is omitted, the script creates a regular target **MailUser** object.
LocalForestCredential	Optional	The *LocalForestCredential* parameter specifies the administrator with permissions to write data to the target forest Active Directory. We recommend that you explicitly specify this parameter to avoid Active Directory permission issues. If the remote forest and the local forest have a trusted relationship configured, don't use a user account from the remote forest as the local forest credential, even though the remote user account may have permission to modify Active Directory in the local forest.
LocalForestDomainController	Optional	The *LocalForestDomainController* parameter specifies a domain controller in the target forest where the mail user will be created. We recommend that you specify this parameter to avoid possible domain controller replication delay issues in the local forest that could occur if a random domain controller is selected.

PARAMETER	REQUIRED	DESCRIPTION
MailboxDeliveryDomain	Optional	The *MailboxDeliveryDomain* parameter specifies an authoritative domain of the source forest so that the script can select the correct source mailbox user's **proxyAddress** property as the target mail user's **targetAddress** property. By default, the primary SMTP address of the source mailbox user is set as the **targetAddress** property of the target mail user.
OverWriteLocalObject	Optional	The *OverWriteLocalObject* parameter is used for users created by the Active Directory Migration Tool. The properties are copied from the existing mail contact to the newly created mail user. However, after this copy, the script also copies the properties from the source forest user to the newly created mail user.
TargetMailUserOU	Optional	The *TargetMailuserOU* parameter specifies the organizational unit (OU) under which the target mail user will be created.
UseLocalObject	Optional	The *UseLocalObject* parameter specifies whether to convert the existing local object to the required target mail user if the script detects an object in the local forest that conflicts with the to-be-created mail user.

Examples

This section contains several examples of how you can use the Prepare-MoveRequest.ps1 script.

Example: Single linked mail user

This example provisions a single linked mail user in the local forest, when there is forest trust between the remote forest and local forest.

1. Run the following commands to get the local forest and remote forest credentials.

   ```
   $LocalCredentials = Get-Credential
   ```

   ```
   $RemoteCredentials = Get-Credential
   ```

2. Run the following command to pass the credential information to the *LocalForestCredential* and *RemoteForestCredential* parameters in the Prepare-MoveRequest.ps1 script.

   ```
   Prepare-MoveRequest.ps1 -Identity JamesAlvord@Contoso.com -RemoteForestDomainController
   DC001.Fabrikam.com -RemoteForestCredential $RemoteCredentials -LocalForestDomainController
   DC001.Contoso.com -LocalForestCredential $LocalCredentials -LinkedMailUser
   ```

Example: Pipelining

This example supports pipelining if you supply a list of mailbox identities.

1. Run the following command.

   ```
   $UserCredentials = Get-Credential
   ```

2. Run the following command to pass the credential information to the *RemoteForestCredential* parameter in the Prepare-MoveRequest.ps1 script.

   ```
   "IanP@Contoso.com", "JoeAn@Contoso.com" | Prepare-MoveRequest.ps1 -RemoteForestDomainController
   DC001.Fabrikam.com -RemoteForestCredential $UserCredentials
   ```

Example: Use a .csv file to bulk-create mail users

You can generate a .csv file containing a list of mailbox identities from the source forest, which allows you to pipe the content of this file into the script to bulk-create the target mail users.

For example, the content of the .csv file can be:

```
Identity
Ian@contoso.com
John@contoso.com
Cindy@contoso.com
```

This example calls a .csv file to bulk create the target mail users.

1. Run the following command to get the remote forest credentials.

   ```
   $UserCredentials = Get-Credential
   ```

2. Run the following command to pass the credential information to the *RemoteForestCredential* parameter in the Prepare-MoveRequest.ps1 script.

   ```
   Import-Csv Test.csv | Prepare-MoveRequest.ps1 -RemoteForestDomainController DC001.Fabrikam.com -
   RemoteForestCredential $UserCredentials
   ```

Script behavior per target object

This section describes how the script performs in relation to several scenarios for target objects.

Duplicate target mail-enabled object

When the script attempts to create a target mail user from the source mailbox user, and it detects a duplicate local mail-enabled object, it uses the following logic:

- If the source mailbox user's **masterAccountSid** attribute equals any target object's **objectSid** or **masterAccountSid** attribute:
  - If the target object isn't mail-enabled, the script returns an error because the script doesn't support converting an object that isn't mail-enabled to a mail user.
  - If the target object is mail-enabled, the target object is a duplicate.
- If an address in the source mailbox user's **proxyAddress** properties (smtp/x500 only) equals an address in a target object's **proxyAddress** properties (smtp/x500 only), the target object is a duplicate.

The script prompts the user about the duplicate objects.

If the target mail-enabled object is a mail user or mail contact, which is most likely created by a cross-forest global address list (GAL) synchronization deployment, you can run the script again with the *UseLocalObject* parameter to use the target mail-enabled object for mailbox migration.

Mail user

If the target object is a mail user, the script copies the following attributes from the source mailbox user to the target mail user:

- **msExchMailboxGUID**
- **msExchArchiveGUID**
- **msExchArchiveName**

If the *LinkedMailUser* parameter is set, the script copies the source **objectSid** / **masterAccountSid** attribute.

Mail contact

If the target object is a mail contact, the script deletes the existing contact and copies all its attributes to a new mail user. The script also copies the following attributes from the source mailbox user:

- **msExchMailboxGUID**
- **msExchArchiveGUID**
- **msExchArchiveName**
- **sAMAccountName**
- **userAccountControl** (set to 514; equivalent to `0x202, ACCOUNTDISABLE | NORMAL_ACCOUNT`)
- **userPrincipalName**

If the *LinkedMailUser* parameter is set, the script copies the source **objectSid** / **masterAccountSid** attribute.

LegacyExchangeDN attribute

When the **Update-Recipient** cmdlet is called to convert the target object into a mail user, a new **LegacyExchangeDN** attribute is generated for the target mail user. The script copies the **LegacyExchangeDN** attribute of the target mail user as an x500 address to the **proxyAddress** properties of the source mailbox user.

Enable the MRS Proxy endpoint for remote moves

8/3/2020 • 3 minutes to read • Edit Online

The Mailbox Replication service (MRS) has a proxy endpoint that's required for cross-forest mailbox moves and remote move migrations between your on-premises Exchange organization and Microsoft 365 or Office 365. You enable the MRS proxy endpoint in the Exchange Web Services (EWS) virtual directory settings in the Client Access (frontend) services on Exchange 2016 or Exchange 2019 Mailbox servers.

Where you enable the MRS Proxy endpoint depends on the type and direction of the mailbox move:

- **Cross-forest enterprise moves**: For cross-forest moves that are initiated from the target forest (known as a *pull* move type), you need to enable the MRS Proxy endpoint on Mailbox servers in the source forest. For cross-forest moves that are initiated from the source forest (known as a *push* move type), you need to enable the MRS Proxy endpoint on Mailbox servers in the target forest.

- **Remote move migrations between an on-premises Exchange organization and Microsoft 365 or Office 365**. For both onboarding and offboarding remote move migrations, you need to enable the MRS Proxy endpoint on Mailbox servers in your on-premises Exchange organization.

Note: If you use theExchange admin center (EAC) to move mailboxes, cross-forest moves and onboarding remote move migrations are pull move types, because you initiate the request from the target environment. Offboarding remote move migrations are push move types because you initiate the request from the source environment.

What do you need to know before you begin?

- Estimated time to complete: 2 minutes per server.

- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Exchange Web Services permissions" section in the Clients and mobile devices permissions topic.

- If you've deployed multiple Mailbox servers in your Exchange organization, you should enable the MRS Proxy endpoint in the Client Access services on each Mailbox server. If you add additional Mailbox servers, be sure to enable the MRS Proxy endpoint on the new servers. Cross-forest moves and remote move migrations can fail if the MRS Proxy endpoint isn't enabled on all Mailbox servers.

- If you don't perform cross-forest moves or remote move migrations, keep MRS Proxy endpoints disabled in the Client Access services on Mailbox servers to reduce the attack surface of your organization.

- Exchange Online requires Windows authentication for the MRS proxy endpoint in the Exchange Web Services (EWS) virtual directory in the Client Access (front end) services.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

TIP

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the EAC to enable the MRS Proxy endpoint

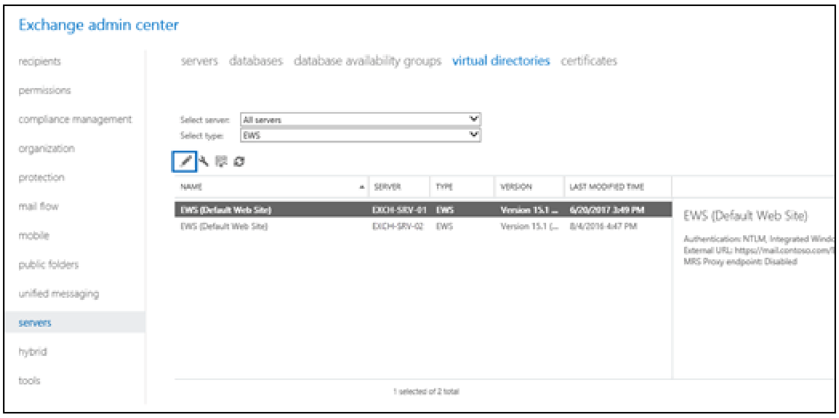
1. In the EAC, go to **Servers** > **Virtual Directories**.

2. Select the EWS virtual directory that you want to configure.

   - You can use the **Select server** drop-down list to filter the Exchange servers by name.

   - To only display EWS virtual directories, select **EWS** in the **Select type** drop-down list.

   After you've selected the EWS virtual directory that you want to configure, click **Edit** ✎.



Select server: All servers
Select type: EWS

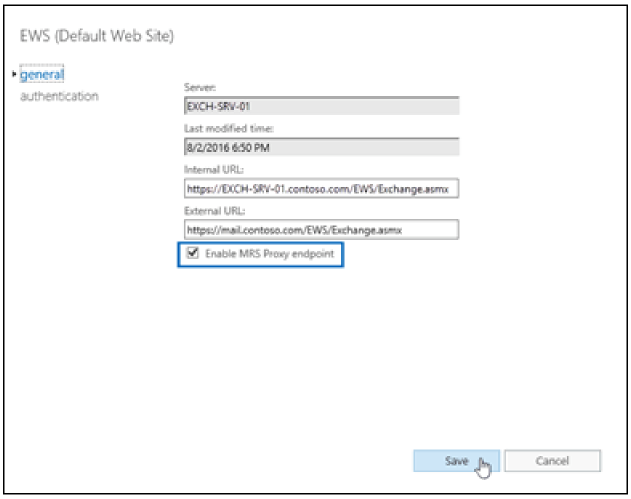
NAME	SERVER	TYPE	VERSION	LAST MODIFIED TIME
EWS (Default Web Site)	EXCH-SRV-01	EWS	Version 15.1 ...	6/20/2017 3:49 PM
EWS (Default Web Site)	EXCH-SRV-02	EWS	Version 15.1 (...	8/4/2016 4:47 PM

1 selected of 2 total

EWS (Default Web Site)

Authentication: NTLM, Integrated Windo
External URL: https://mail.contoso.com/
MRS Proxy endpoint: Disabled

3. On the properties page that opens, on the **General** tab, select the **Enable MRS Proxy endpoint** check box, and then click **Save**.



EWS (Default Web Site)

Server:
EXCH-SRV-01

Last modified time:
8/2/2016 6:50 PM

Internal URL:
https://EXCH-SRV-01.contoso.com/EWS/Exchange.asmx

External URL:
https://mail.contoso.com/EWS/Exchange.asmx

☑ Enable MRS Proxy endpoint

Use the Exchange Management Shell to enable the MRS Proxy endpoint

To enable the MRS Proxy endpoint, use this syntax:

```
Set-WebServicesVirtualDirectory -Identity "[<Server>\]EWS (Default Web Site)" -MRSProxyEnabled $true
```

This example enables the MRS Proxy endpoint in Client Access services on the Mailbox server named EXCH-SRV-01.

```
Set-WebServicesVirtualDirectory -Identity "EXCH-SRV-01\EWS (Default Web Site)" -MRSProxyEnabled $true
```

This example enables the MRS Proxy endpoint in Client Access services on all Mailbox servers in your Exchange organization.

```
Get-WebServicesVirtualDirectory | Set-WebServicesVirtualDirectory -MRSProxyEnabled $true
```

For detailed syntax and parameter information, see Set-WebServicesVirtualDirectory.

How do you know this worked?

To verify that you've successfully enabled the MRS Proxy endpoint, do any of these steps:

- In the EAC, go to **Servers** > **Virtual Directories** > select the EWS virtual directory, and verify in the details pane that the MRS Proxy endpoint is enabled.

  
  Select server: All servers
  Select type: EWS

NAME	SERVER	TYPE	VERSION	LAST MODIFIED TIME
EWS (Default Web Site)	EXCH-SRV-01	EWS	Version 15.1 ...	6/20/2017 3:49 PM
EWS (Default Web Site)	EXCH-SRV-02	EWS	Version 15.1 (...	8/4/2016 4:47 PM

  EWS (Default Web Site)
  Authentication: NTLM, Integrated Win
  External URL: https://mail.contoso.com
  MRS Proxy endpoint: Enabled

  1 selected of 2 total

- Run this command in the Exchange Management Shell, and verify that the **MRSProxyEnabled** property for the EWS virtual directory has the value `True`:

  ```
  Get-WebServicesVirtualDirectory | Format-Table -Auto Identity,MRSProxyEnabled
  ```

- Use the **Test-MigrationServerAvailability** cmdlet in the Exchange Management Shell to test communication with the remote servers that hosts the mailboxes that you want to move (or the servers in your on-premises Exchange organization for offboarding remote move migrations from Microsoft 365 or Office 365).

  Replace *<EmailAddress>* with the email address of one of the mailboxes that you want to move, and run this command in the Exchange Management Shell:

  ```
  Test-MigrationServerAvailability -ExchangeRemoteMove -Autodiscover -EmailAddress <EmailAddress> -
  Credentials (Get-Credential)
  ```

  To run this command successfully, the MRS Proxy endpoint must be enabled.

  For detailed syntax and parameter information, see Test-MigrationServerAvailability.

Recreate missing arbitration mailboxes

8/3/2020 • 5 minutes to read • Edit Online

Exchange Server contains five special system mailboxes (seven in Exchange 2016 CU8 and later) known as *arbitration mailboxes*. Arbitration mailboxes are used for storing different types of system data and for managing messaging approval workflow. The following table lists each type of arbitration mailbox and their responsibilities.

ARBITRATION MAILBOX NAME	DISPLAY NAME	PERSISTED CAPABILITIES	FUNCTION
FederatedEmail.4c1f4d8b-8179-4148-93bf-00a95fa1e042	Microsoft Exchange Federation Mailbox	none	This mailbox stores data used to maintain federation between different Exchange organizations. This includes Rights Management Services, cross-premises mail-flow monitoring probes and responses, notifications, online archives, messaging records management, and cross-premises free/busy information.
Migration.8f3e7716-2011-43e4-96b1-aba62d229136	Microsoft Exchange Migration	Management	Stores data for the Exchange migration service to use when moving mailboxes in batches.
SystemMailbox{1f05a927-XXXX-XXXX-XXXX-XXXXXXXXXXXX} (for example, SystemMailbox{1f05a927-9350-4efe-a823-5529c2d64109}; most of the mailbox name is unique to your organization)	Microsoft Exchange Approval Assistant	none	This mailbox is provisioned for use by the Exchange approval framework for recipient moderation and auto group approval requests.
SystemMailbox{bb558c35-97f1-4cb9-8ff7-d53741dc928c}	Microsoft Exchange	ClientExtensions GMGen MailRouting MessageTracking OABGen PstProvider UMGrammar UMGrammarReady (Exchange 2016 only)	This is known as an organization mailbox. It is used for creating offline address books (OABs). To load-balance OAB generation across your organization, including across geographically separate sites, you can create additional organization mailboxes.

ARBITRATION MAILBOX NAME	DISPLAY NAME	PERSISTED CAPABILITIES	FUNCTION
SystemMailbox{e0dc1c29-89c3-4034-b678-e6c29d823ed9}	Microsoft Exchange	UMDataStorage	Discovery system mailbox. Provisioned for use by the e-Discovery feature, which is used by compliance officers to locate messages that match specified selection criteria. This mailbox is also used by Unified Messaging in Exchange 2016 for storing UM console attending files and other information.
SystemMailbox{D0E409A0-AF9B-4720-92FE-AAC869B0D201} (Exchange 2016 CU8 and later)	Microsoft Exchange	none	
SystemMailbox{2CE34405-31BE-455D-89D7-A7C7DA7A0DAA} (Exchange 2016 CU8 and later)	Microsoft Exchange	none	

If you need to re-create one of more of these arbitration mailboxes, see the instructions that follow.

What do you need to know before you begin?

- Estimated time to complete: 10 minutes per procedure.
- You need to be assigned permissions before you can perform these procedures. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.
- To run `Setup.exe /PrepareAD`, your account needs to be a member of the Enterprise Admins security group.
- The computer that you use to run `Setup.exe /PrepareAD` requires access to Setup.exe in the Exchange installation files:
  1. Use your most recently downloaded copy of the Exchange ISO image file, or download an updated copy from Updates for Exchange Server.
  2. In File Explorer, right-click on the Exchange ISO image file and then select **Mount**. Note the virtual DVD drive letter that's assigned.
  3. Open a Windows Command Prompt window. For example:
     - Press the Windows key + 'R' to open the **Run** dialog, type cmd.exe, and then press **OK**.
     - Press **Start**. In the **Search** box, type **Command Prompt**, then in the list of results, select **Command Prompt**.
- For more information about opening the Exchange Management Shell, see Open the Exchange Management Shell.
- For more information about running Exchange Setup in unattended mode, see Use unattended mode in Exchange Setup.

Re-create an arbitration mailbox

Use the following instructions to re-create a particular type of arbitration mailbox.

Re-create the Microsoft Exchange Federation Mailbox

To re-create the arbitration mailbox FederatedEmail.4c1f4d8b-8179-4148-93bf-00a95fa1e042, run the following commands:

1. If the mailbox is missing, run the following command from a Windows Command Prompt window:

   ```
   <Virtual DVD drive letter>:\Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareAD
   ```

   For example:

   ```
   E:\Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareAD
   ```

2. In the Exchange Management Shell, run the following command:

   ```
   Enable-Mailbox -Identity "FederatedEmail.4c1f4d8b-8179-4148-93bf-00a95fa1e042" -Arbitration
   ```

Re-create the Microsoft Exchange Migration mailbox

To re-create the arbitration mailbox Migration.8f3e7716-2011-43e4-96b1-aba62d229136, run the following commands:

1. If the mailbox is missing, run the following command from a Windows Command Prompt window:

   ```
   <Virtual DVD drive letter>:\Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareAD
   ```

   For example:

   ```
   E:\Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareAD
   ```

2. In the Exchange Management shell, run the following command:

   ```
   Enable-Mailbox -Identity "Migration.8f3e7716-2011-43e4-96b1-aba62d229136" -Arbitration
   ```

3. In the Exchange Management Shell, set the Persisted Capabilities (msExchCapabilityIdentifiers) for the mailbox by running the following command:

   ```
   Set-Mailbox -Identity "Migration.8f3e7716-2011-43e4-96b1-aba62d229136" -Arbitration -Management $true -
   Force
   ```

Re-create the Microsoft Exchange Approval Assistant mailbox

To re-create the arbitration mailbox SystemMailbox{1f05a927-XXXX-XXXX-XXXX-XXXXXXXXXXXX}, run the following commands:

1. If the mailbox is missing, run the following command from a Windows Command Prompt window:

   ```
   <Virtual DVD drive letter>:\Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareAD
   ```

For example:

```
E:\Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareAD
```

2. In the Exchange Management Shell, run the following command:

```
Get-User -ResultSize Unlimited | where {$_.Name -like "SystemMailbox{1f05a927*"} | Enable-Mailbox -
Arbitration
```

Re-create the Microsoft Exchange organization mailbox for OABs

To re-create the arbitration mailbox SystemMailbox{bb558c35-97f1-4cb9-8ff7-d53741dc928c}, run the following commands:

1. If the mailbox is missing, run the following command from a Windows Command Prompt window:

```
<Virtual DVD drive letter>:\Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareAD
```

For example:

```
E:\Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareAD
```

2. In the Exchange Management Shell, run the following command:

```
Enable-Mailbox -Identity "SystemMailbox{bb558c35-97f1-4cb9-8ff7-d53741dc928c}" -Arbitration
```

3. In the Exchange Management Shell, set the Persisted Capabilities (msExchCapabilityIdentifiers) for the mailbox by running the following command:

```
Get-Mailbox "SystemMailbox{bb558c35-97f1-4cb9-8ff7-d53741dc928c}" -Arbitration | Set-Mailbox -
Arbitration -UMGrammar $true -OABGen $true -GMGen $true -ClientExtensions $true -MessageTracking $true -
PstProvider $true -MaxSendSize 1GB -Force
```

4. In the Exchange Management Shell, add the required capabilities to the mailbox by running the following commands:

```
$OABMBX = Get-Mailbox "SystemMailbox{bb558c35-97f1-4cb9-8ff7-d53741dc928c}" -Arbitration; Set-ADUser
$OABMBX.SamAccountName -Add @{"msExchCapabilityIdentifiers"="40","42","43","44","47","51","52","46"}
```

Re-create the Microsoft Exchange Discovery system mailbox

To re-create the arbitration mailbox SystemMailbox{e0dc1c29-89c3-4034-b678-e6c29d823ed9}, run the following commands:

1. If the mailbox is missing, run the following command from a Windows Command Prompt window:

```
<Virtual DVD drive letter>:\Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareAD
```

For example:

```
E:\Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareAD
```

2. In the Exchange Management shell, run the following command:

   ```
   Enable-Mailbox -Identity "SystemMailbox{e0dc1c29-89c3-4034-b678-e6c29d823ed9}" -Arbitration
   ```

3. In the Exchange Management Shell, set the Persisted Capabilities (msExchCapabilityIdentifiers) for the mailbox by running the following command:

   ```
   Set-Mailbox -Identity "SystemMailbox{e0dc1c29-89c3-4034-b678-e6c29d823ed9}" -Arbitration -UMDataStorage
   $true -Force
   ```

Re-create the Microsoft Exchange 2016 CU8 and later system mailboxes

To re-create the arbitration mailbox SystemMailbox{D0E409A0-AF9B-4720-92FE-AAC869B0D201} and SystemMailbox{2CE34405-31BE-455D-89D7-A7C7DA7A0DAA}, run the following commands:

1. If the mailboxes are missing, run the following command from a Windows Command Prompt window:

   ```
   <Virtual DVD drive letter>:\Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareAD
   ```

   For example:

   ```
   E:\Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareAD
   ```

2. In the Exchange Management shell, run the following command:

   ```
   Enable-Mailbox -Identity "SystemMailbox{D0E409A0-AF9B-4720-92FE-AAC869B0D201}" -Arbitration
   Enable-Mailbox -Identity "SystemMailbox{2CE34405-31BE-455D-89D7-A7C7DA7A0DAA}" -Arbitration
   ```

3. In the Exchange Management Shell, set the Persisted Capabilities (msExchCapabilityIdentifiers) for the mailbox by running the following command:

   ```
   $ShardMBX = Get-Mailbox -Identity "SystemMailbox{2CE34405-31BE-455D-89D7-A7C7DA7A0DAA}" -Arbitration
   Set-Mailbox -Identity "SystemMailbox{2CE34405-31BE-455D-89D7-A7C7DA7A0DAA}" -Arbitration
   Set-ADUser $ShardMBX.SamAccountName -Add @{"msExchCapabilityIdentifiers"="66"}
   Set-ADUser $ShardMBX.SamAccountName -Add @{"msExchMessageHygieneSCLDeleteThreshold"="9"}
   Set-ADUser $ShardMBX.SamAccountName -Add @{"msExchMessageHygieneSCLJunkThreshold"="4"}
   Set-ADUser $ShardMBX.SamAccountName -Add @{"msExchMessageHygieneSCLQuarantineThreshold"="9"}
   Set-ADUser $ShardMBX.SamAccountName -Add @{"msExchMessageHygieneSCLRejectThreshold"="7"}
   ```

How do you know this worked?

To verify that you've successfully re-created the arbitration mailbox, set the search scope to search the entire Active Directory forest, an then use the **Get-Mailbox** cmdlet with the *Arbitration* switch to retrieve system mailboxes.

```
Set-ADServerSettings -ViewEntireForest $true; Get-Mailbox -Arbitration | Format-Table Name,DisplayName
```

View the results of the command to verify that appropriate system mailbox, either by Name or Display Name from the above table, has been re-created.

Managed Store in Exchange Server

8/3/2020 • 5 minutes to read • Edit Online

The Managed Store is the name for the Information Store (also known as the Store) processes in Exchange Server 2016 and Exchange Server 2019. Introduced in Exchange Server 2013, the Managed Store uses a controller/worker process model that provides storage process isolation and faster database failover. The Managed Store also uses a static database caching mechanism that replaces the dynamic buffer algorithm in previous versions of Exchange.

The multi-process model that's used by the Managed Store consists of the following processes on the Mailbox server:

- A single store service controller process for the whole Exchange server (Microsoft.Exchange.Store.Service.exe, also known as MSExchangeIS).
- Ane worker process for each mounted database (Microsoft.Exchange.Store.Worker.exe). When a database is mounted, a new worker process is instantiated that services only that database. When a database is dismounted, the worker process for that database is terminated.

For example, if you have 40 mailbox databases mounted on a Mailbox server, there will be 41 processes running for the Managed Store: one for each database, and one for the store service process controller. The store process controller monitors the health of all store worker processes on the server. A forcible or unexpected termination the Microsoft.Exchange.Store.Service.exe causes an immediate failover of all active database copies on the server.

The Managed Store is also tightly integrated with the Microsoft Exchange Replication service (MSExchangeRepl.exe) and Active Manager. The controller process, worker processes, and Replication service work together to provide greater availability and reliability as described in the following list:

- **Microsoft Exchange Replication service process (MSExchangeRepl.exe)**:
  - Responsible for issuing mount and dismount operations to the Store.
  - Initiates recovery action on storage or database failures reported by the Store, the Extensible Storage Engine (ESE), and Managed Availability responders.
  - Detects unexpected database failures.
  - Provides the administrative interface for management tasks.
- **Store service process/controller (Microsoft.Exchange.Store.Service.exe)**:
  - Manages each worker process lifetime based on the mount and dismount operations received from the Replication service.
  - Handles incoming requests from the Windows Service Control Manager.
  - Logs failure items when store worker process problems detected (for example, hang or unexpected exit).
  - Terminates store worker processes in response failover event.
- **Store worker process (Microsoft.Exchange.Store.Worker.exe)**
  - Responsible for executing RPC operations for mailboxes on a database.
  - RPC endpoint instance within worker process is the database GUID.
  - Provides database cache for a database.

Static database caching algorithm

The Managed Store uses a very simple and straightforward algorithm for determining database cache as compared to *dynamic buffer allocation* that was used in the previous versions of Exchange. The memory that's allocated for each database cache (that is, each store worker process) is based on number of local database copies and configured value of the *MaximumActiveDatabases* parameter on the **Set-MailboxServer** cmdlet (the default value is $null or blank). If the value of *MaximumActiveDatabases* is greater than number of current database copies, then the cache calculation is based on the number of database copies.

The static algorithm allocates memory for the ESE cache of each store worker process based on the amount of physical RAM that's installed in the server. This is referred to the *Max Cache Target* of the database. 25% of total server memory is allocated to the ESE cache, and is referred to as the *Server Cache Size Target*.

> **NOTE**
>
> You can override the Server Cache Size Target, and therefore the amount of memory allocated to the Store for ESE cache by using `msExchESEParamCacheSizeMax` attribute of the *InformationStore* object in Active Directory (the value configured is the number of 32 KB pages to allocate across all store processes).

A static amount of this cache is allocated to active and passive copies. The store worker process will be allocated the Max Cache Target only when servicing an active database copy. Passive database copies are allocated 20 percent of the Max Cache Target. The remainder is reserved by the Store, and allocated to the worker process if the database transitions from passive to active.

Max Cache Target is calculated only at Store startup. Therefore, if you add or remove databases or database copies, you must restart the Store controller service (MSExchangeIS) so that the cache can be adjusted accordingly. If the service is not restarted, new databases will have a smaller cache size target than databases that existed before the last service startup. In this scenario, the sum of database cache size targets will likely exceed the Server Cache Size Target until MSExchangeIS is restarted.

Example database cache calculations

Here are example database caching calculations that are based on a Mailbox server's memory and database configuration.

Example 1

Mailbox server configuration:

- 48 GB of memory
- Two active databases and two passive databases
- *MaximumActiveDatabases* parameter: not configured

The amount of database cache is 3 GB for each active database copy worker process and 0.6 GB for each passive database copy worker process. Here's how these values are calculated:

- **Server Cache Size Target**: 25% of the amount of memory: 48 GB * 0.25 = **12 GB**.
- **Database Max Cache Target**: Divide the Server Cache Size Target by the total number of active and passive databases: 12 GB / 4 databases = **3 GB**.
- **Memory used for passive database copies**: 20% of the Database Max Cache Target: 3 GB * 0.20 = **0.6 GB**.

Of the 12 GB of memory that's assigned to the Server Cache Size Target:

- 7.2 GB will be in use by database worker processes.
- 4.8 GB will be reserved by the Information Store for the two passive database copies in case they become active copies. If this happens, they will use their Max Cache Target of 3 GB.

Example 2

Mailbox server configuration:

- 48 GB of memory
- Two active databases and two passive databases
- *MaximumActiveDatabases* parameter: 2

The amount of database cache is 5 GB for each active database copy worker process and 0.2 GB for each passive database copy worker process. Here's how these values are calculated:

- **Server Cache Size Target**: 25% of the amount of memory: 48 GB * 0.25 = **12 GB**.
- **Database Max Cache Target**: Divide the Server Cache Size Target by the sum of:
  - The number of active databases
  - 20% of the number of passive databases

  12 GB / (2A + (2P * 0.20)) = **5 GB**
- **Memory used for passive database copies**: 20% of the Database Max Cache Target: 5 GB * 0.20 = **1 GB**.

Out of the 12 GB of memory assigned to the Server Cache Size Target:

- 12 GB will be in use by database worker processes
- No memory will be reserved by the Information Store for the two passive database copies because they cannot become active copies (*MaximumActiveDatabases* is configured with a value of 2, and there are already 2 active database copies on the server).

Managed Store Limits in Exchange Server

8/3/2020 • 5 minutes to read • Edit Online

The Managed Store in Exchange Server 2016 and Exchange Server 2019 is the name for the Information Store (also known as the Store) processes that manages mailbox databases. The Managed Store has connection and usage limits that prevent a single application or a single user from using all of the available connections, which could result in downtime. This topic describes the limits and how you can change them.

For more information about the Managed Store, see Managed Store in Exchange Server.

> **NOTE**
>
> Connections by administrator accounts have maximum session limits of 64000.
>
> Exchange Online limits (including Managed Store limits) are described in the Exchange Online Limits.

Terminology

Knowledge of the following terms will help you understand the types of connections referenced in this topic.

- **Sessions**

  Sessions represent the connections used by services and client applications (for example, Microsoft Outlook) to connect to the Managed Store. Services and clients can have multiple sessions at a particular time. The terms *connections* and *sessions* can be used interchangeably.

- **Threads**

  Threads represent concurrently executing requests to the Managed Store. For example, if a user opens a folder in Outlook, Outlook executes a request to the Managed Store on behalf of the user. That execution of the request is a single thread.

  For all clients, the maximum number of threads **per mailbox database** is 50. The exception is the Availability service, which has a maximum limit of 16 per user.

Session limits

Session limits are based on connections per mailbox database on the server.

The types of connection limits are:

- **Max sessions per process**: The maximum number of sessions that an Exchange service can have open at one time on a mailbox database.

- **Max user sessions per process**: The maximum number of sessions for a specific protocol for a single user.

The types of client connections to the Managed Store and the limits based on those connections are described in the following table.

CLIENT TYPE	MAX SESSIONS PER MAILBOX DATABASE	DEFAULT NUMBER OF USER SECTIONS PER MAILBOX DATABASE
Admin	10000	n/a
Availability service	10000	16
Content indexing	10000	n/a
Exchange ActiveSync	n/a	16
Exchange Web Services	n/a	16
Management	n/a	16
MAPI on the Middle Tier (MoMT)	n/a	32
MSExchangeMailboxAssistants: Events	10000	n/a
MSExchangeMailboxAssistants: Timed	10000	n/a
MSExchange Remote Procedure Call	n/a	16
Outlook on the web (formerly known as Outlook Web App)	n/a	16
POP3 and IMAP4	n/a	16
Transport	10000	n/a
Unified Messaging (Exchange 2016 only)	n/a	16
Others	n/a	16

Use the following procedure to modify the default session limits.

Notes:

- When you modify a session limit, you need to modify that limit on all Mailbox servers within a database availability group (DAG). If you don't make the same changes on all servers, the results will be inconsistent.
- To increase a session limit in the Client Access (frontend) services, you need to use the Set-ThrottlingPolicy cmdlet in the Exchange Management Shell.

WARNING

Incorrectly editing the registry can cause serious problems that may require you to reinstall your operating system. Problems resulting from editing the registry incorrectly may not be able to be resolved. Before editing the registry, back up any valuable data.

1. Open the Registry Editor. For example, press Windows key + R, and then run **regedit**.
2. Go to the following location in the registry:

\\HKEY_LOCAL_MACHINE
\SYSTEM\CurrentControlSet\Services\MSExchangeIS\ParametersSystem.

3. Select the **ParametersSystem** subkey, click **Edit** > **New**, and then select **DWORD (32-bit) Value**.

   The new value is created as **New Value #1** in the right pane.

4. Rename the new key to one of the following values, and then press Enter:

   - **Maximum Allowed Sessions Per User**: This limit specifies the maximum allowable sessions per user.
   - **Maximum Allowed Service Sessions Per User**: This limit specifies the maximum allowed service sessions per user.
   - **Maximum Allowed Exchange Sessions Per Service**: This limit specifies the maximum allowed Exchange sessions per service. The default value is 10,000.

5. Select the new key, and then click **Edit** > **Modify**.

6. In the dialog that opens, switch the **Base** value to **Decimal** and enter the new session limit in the **Value data** field.

   When you're finished, click **OK**.

Open item limits

Open item limits are limits placed on the number of items that can be opened by a single mailbox in a single session. However, a user can have multiple sessions opened simultaneously. For example, if a user has two sessions opened, the user could open 1,000 folders.

The open item limits are described in the following table

ITEM TYPE	REGISTRY OBJECT TYPE	MAX OPENED PER SESSION
ACL View	objtACLView	500
Attachment	objtAttachment	500
Attachment View	objtAttachmentView	500
CStream	objtCStream	Not applicable
Folder	objtFolder	500
Folder View	objtFolderView	500
FX Destination Stream	objtFXDstStrm	500
FX Source Stream	objtFXSrcStrm	500
Message	objtMessage	250
Message View	objtMessageView	500
Notification	objtNotify	500,000

ITEM TYPE	REGISTRY OBJECT TYPE	MAX OPENED PER SESSION
Rule View	objtRulesView	Not applicable
Stream	objtStream	250

You can limit the maximum number of resources that a MAPI client (for example, Outlook) can use simultaneously.

Note: When you modify a session limit, you need to modify that limit on all Mailbox servers within a database availability group (DAG). If you don't make the same changes on all servers, the results will be inconsistent.

> **WARNING**
> Incorrectly editing the registry can cause serious problems that may require you to reinstall your operating system. Problems resulting from editing the registry incorrectly may not be able to be resolved. Before editing the registry, back up any valuable data.

1. Open the Registry Editor. For example, press Windows key + R, and then run **regedit**.

2. Go to the following location in the registry:

   \\HKEY_LOCAL_MACHINE \SYSTEM\CurrentControlSet\Services\MSExchangeIS\ParametersSystem

3. Select the **ParametersSystem** subkey, click **Edit** > **New**, and then select **Key**.

   The new value is created as **New Key #1** in the left pane.

4. Rename the new key to **MaxObjsPerMapiSession**, and then press Enter.

5. Select the **MaxObjsPerMapiSession** subkey, click **Edit** > **New**, and then select **DWORD (32-bit) Value**.

   The new key is created as **New Value #1** in the right pane.

6. Rename the key to match one of the **Registry object type** values in the table. For example, to modify the number of messages that can be opened, enter *objtMessage* and then press Enter.

7. Select the new key, and then click **Edit** > **Modify**.

8. In the dialog that opens, switch the **Base** value to **Decimal** and enter the new limit in the **Value data** field. For example, enter **350** to increase the value for *objtMessage*.

   When you're finished, click **OK**.

9. Restart the Microsoft Exchange Information Store service by running the following command in Windows PowerShell or the Exchange Management Shell:

   ```
   Restart-Service MSExchangeIS
   ```

Item size limits

Item size limits are the limits placed on items within a user's mailbox. You configure these limits by using the *MaxSendSize* and *MaxReceiveSize* parameters on the Set-Mailbox cmdlet in the Exchange Management Shell.

ITEM TYPE	LIMIT
Message (saved)	Maximum size of the SendLimit, ReceiveLimit
Message (sent)	Maximum size of the SendLimit

Edge Transport servers

8/3/2020 • 3 minutes to read • Edit Online

Edge Transport servers handle all inbound and outbound Internet mail flow by providing mail relay and smart host services for your Exchange organization. Agents running on the Edge Transport server provide additional layers of message protection and security. These agents provide protection against spam and apply mail flow rules (also known as transport rules) to control mail flow. All of these features work together to help minimize the exposure of your internal Exchange to threats on the Internet.

Because the Edge Transport server is installed in the perimeter network, it's never a member of your organization's internal Active Directory forest and doesn't have access to Active Directory information. However, the Edge Transport server requires data that resides in Active Directory: for example, connector information for mail flow and recipient information for antispam recipient lookup tasks. This data is synchronized to the Edge Transport server by the Microsoft Exchange EdgeSync service (EdgeSync). EdgeSync is a collection of processes run on an Exchange 2016 or Exchange 2019 Mailbox server to establish one-way replication of recipient and configuration information from Active Directory to the Active Directory Lightweight Directory Services (AD LDS) instance on the Edge Transport server. EdgeSync copies only the information that's required for the Edge Transport server to perform antispam configuration tasks and to enable end-to-end mail flow. EdgeSync performs scheduled updates so the information in AD LDS remains current. For more information about Edge Subscriptions and EdgeSync, see Edge Subscriptions.

You can install more than one Edge Transport server in the perimeter network. Deploying more than one Edge Transport server provides redundancy and failover capabilities for your inbound message flow. You can load balance the SMTP traffic to your organization among Edge Transport servers by defining more than one MX record with the same priority value for your mail domain. You can achieve consistency in the configuration among multiple Edge Transport servers by using cloned configuration scripts.

The Edge Transport server role lets you manage the following message-processing scenarios.

Internet mail flow

Edge Transport servers accept messages coming into the Exchange organization from the Internet. After the messages are processed by the Edge Transport server, mail is routed to an internal Exchange Mailbox server; first to the Front End Transport service, and then to the Transport service.

All messages sent to the Internet from inside the organization are routed to Edge Transport servers after the messages are processed by the Transport service on the Exchange Mailbox server. You can configure the Edge Transport server to use DNS to resolve MX resource records for external SMTP domains, or you can configure the Edge Transport server to forward messages to a smart host for DNS resolution.

Antispam protection

In Exchange Server, antispam features provide services to block unsolicited commercial email (spam) at the network perimeter.

Spammers use a variety of techniques to send spam into your organization. Edge Transport servers help prevent users from ever receiving spam by providing a collection of agents that work together to provide different layers of spam filtering and protection. Establishing tarpitting intervals on connectors makes email harvesting attempts ineffective.

Mail flow rules on Edge Transport servers

Mail flow rules on Edge Transport servers are used to control the flow of messages sent to or received from the internet. Mail flow rules are configured on each Edge Transport server to help protect corporate network resources and data by applying an action to messages meeting specified conditions. Mail flow rule conditions are based on data, such as specific words or text patterns in the message subject, body, header, or from address; the spam confidence level (SCL); or the attachment type. Actions determine how the message is processed when a specified condition is true. Possible actions include quarantining a message, dropping or rejecting a message, appending additional recipients, or logging an event. Optional exceptions exempt particular messages from having an action applied.

Address rewriting

Address rewriting presents a consistent email address appearance to external recipients. You configure address rewriting on Edge Transport servers to modify the SMTP addresses on inbound and outbound messages. Address rewriting is especially useful for newly merged organizations that want to present a consistent email address appearance.

Edge Subscriptions

8/3/2020 • 15 minutes to read • Edit Online

Edge Subscriptions are used to populate the Active Directory Lightweight Directory Services (AD LDS) instance on the Edge Transport server with Active Directory data. Although creating an Edge Subscription is optional, subscribing an Edge Transport server to the Exchange organization provides a simpler management experience and enhances antispam features. You need to create an Edge Subscription if you plan to use recipient lookup or safelist aggregation, or if you plan to help secure SMTP communications with partner domains by using Mutual Transport Layer Security (MTLS).

Edge Subscription process

An Edge Transport server doesn't have direct access to Active Directory. The configuration and recipient information the Edge Transport server uses to process messages is stored locally in AD LDS. Creating an Edge Subscription establishes secure, automatic replication of information from Active Directory to AD LDS. The Edge Subscription process provisions the credentials used to establish a secure LDAP connection between the internal Exchange Mailbox servers and a subscribed Edge Transport server. The Microsoft Exchange EdgeSync service (EdgeSync) that runs on Mailbox servers performs periodic one-way synchronization to transfer up-to-date data to AD LDS. This reduces the administration tasks you perform in the perimeter network by letting you configure the Mailbox server and then synchronize that information to the Edge Transport server.

You subscribe an Edge Transport server to the Active Directory site that contains the Mailbox servers responsible for transferring messages to and from your Edge Transport servers. The Edge Subscription process creates an Active Directory site membership affiliation for the Edge Transport server. The site affiliation enables Mailbox servers in the Exchange organization to relay messages to the Edge Transport server for delivery to the Internet without having to configure explicit Send connectors.

One or more Edge Transport servers can be subscribed to a single Active Directory site. However, an Edge Transport server can't be subscribed to more than one Active Directory site. If you have more than one Edge Transport server deployed, each server can be subscribed to a different Active Directory site. Each Edge Transport server requires an individual Edge Subscription.

To deploy an Edge Transport server and subscribe it to an Active Directory site, follow these steps:

1. Install the Edge Transport server role.

2. Prepare for the Edge Subscription:

   - License the Edge Transport server.

   - Open ports in the firewall for mail flow and EdgeSync synchronization.

   - Verify that the Mailbox servers and the Edge Transport server can locate one another using DNS name resolution.

   - On the Mailbox Server, configure the transport settings to be replicated to the Edge Transport server.

3. On the Edge Transport server, create and export an Edge Subscription file by running the **New-EdgeSubscription** cmdlet.

4. Copy the Edge Subscription file to a Mailbox server or a file share that's accessible from the Active Directory site containing your Mailbox servers.

5. Import the Edge Subscription file to the Active Directory site by running the **New-EdgeSubscription**

cmdlet on the Mailbox server.

Prepare for the Edge Subscription

Before you can subscribe your Edge Transport server to your Exchange organization, you need to make sure your infrastructure and your Mailbox servers are prepared for the EdgeSync synchronization. To prepare for EdgeSync, you need to:

- **License the Edge Transport server**: The licensing information for the Edge Transport server is captured when the Edge Subscription is created. Subscribed Edge Transport servers need to be subscribed to the Exchange organization after the license key has been applied on the Edge Transport server. If the license key is applied on the Edge Transport server after you perform the Edge Subscription process, licensing information will not be updated in the Exchange organization, and you will need to resubscribe the Edge Transport server.

- **Verify that the required ports are open in the firewall**: The following ports are used by subscribed Edge Transport servers:

  - **SMTP**: Port 25/TCP must be open for inbound and outbound mail flow between the Internet and the Edge Transport server, and between the Edge Transport server and the internal Exchange organization.

  - **Secure LDAP**: Non-standard port 50636/TCP is used for directory synchronization from Mailbox servers to AD LDS on the Edge Transport server. This port is required for successful EdgeSync synchronization.

  > **NOTE**
  >
  > Port 50389/TCP is used locally by LDAP to bind to the AD LDS instance. This port doesn't have to be open on the firewall; it's used locally on the Edge Transport server.

  If your environment requires specific ports, you can modify the ports used by AD LDS using the `ConfigureAdam.ps1` script provided with Exchange. Modify the ports before you create the Edge Subscription. If you modify the ports after you create the Edge Subscription, you need to remove the Edge Subscription and create another one.

- **Verify that DNS host name resolution is successful from the Edge Transport server to the Mailbox servers and from the Mailbox servers to the Edge Transport server**

- **Configure the following transport settings for propagation to the Edge Transport server**

  - **Internal SMTP servers**: Use the *InternalSMTPServers* parameter on the **Set-TransportConfig** cmdlet to specify a list of internal SMTP server IP addresses or IP address ranges to be ignored by the Sender ID and Connection Filtering agents on the Edge Transport server.

  - **Accepted domains**: Configure all authoritative domains, internal relay domains, and external relay domains.

  - **Remote domains**: Configure the settings for the default remote domain object (used for recipients in all remote domains), and configure remote domain objects as required for recipients in specific remote domains.

Create and export an Edge Subscription file on the Edge Transport server

When you create an Edge Subscription file by running the **New-EdgeSubscription** cmdlet on the Edge Transport server, the following actions occur:

- An AD LDS account called the EdgeSync bootstrap replication account (ESBRA) is created. These ESBRA credentials are used to authenticate the first EdgeSync connection to the Edge Transport server. This account is configured to expire 24 hours after being created. Therefore, you need to complete the five-step subscription process described in the previous section within 24 hours. If the ESBRA expires before the Edge Subscription process is complete, you will need to run the **New-EdgeSubscription** cmdlet again to create a new Edge Subscription file.

- The ESBRA credentials are retrieved from AD LDS and written to the Edge Subscription file. The public key for the Edge Transport server's self-signed certificate is also exported to the Edge Subscription file. The credentials written to the Edge Subscription file are specific to the server that exported the file.

- Any previously created configuration objects on the Edge Transport server that will now be replicated to AD LDS from Active Directory are deleted from AD LDS, and the Exchange Management Shell cmdlets used to configure those objects are disabled. However, you can still use the **Get-*** cmdlets to view those objects. Running the **New-EdgeSubscription** cmdlet disables the following cmdlets on the Edge Transport server:

    - **Set-SendConnector**
    - **New-SendConnector**
    - **Remove-SendConnector**
    - **New-AcceptedDomain**
    - **Set-AcceptedDomain**
    - **Remove-AcceptedDomain**
    - **New-RemoteDomain**
    - **Set-RemoteDomain**
    - **Remove-RemoteDomain**

This example creates and exports the Edge Subscription file on the Edge Transport server.

```
New-EdgeSubscription -FileName "C:\Data\EdgeSubscriptionInfo.xml"
```

> **NOTE**
>
> When you run the **New-EdgeSubscription** cmdlet on the Edge Transport server, you receive a prompt to acknowledge the commands that will be disabled and the configuration that will be overwritten on the Edge Transport server. To bypass this confirmation, you need to use the *Force* parameter. This parameter is useful when you script the **New-EdgeSubscription** cmdlet. You can also use the *Force* parameter to overwrite an existing file when you resubscribe an Edge Transport server.

Import the Edge Subscription file on a Mailbox server

When you import the Edge Subscription file to the Active Directory site by running the **New-EdgeSubscription** cmdlet on a Mailbox server, the following actions occur:

- The Edge Subscription is created, joining the Edge Transport server to the Exchange organization. EdgeSync will propagate configuration data to this Edge Transport Server, creating an Edge configuration object in Active Directory.

- Each Mailbox server in the Active Directory site receives notification from Active Directory that a new Edge Transport server has been subscribed. The Mailbox server retrieves the ESBRA from the Edge Subscription file. The Mailbox server then encrypts the ESBRA by using the public key of the Edge Transport server's self-signed certificate. The encrypted credentials are then written to the Edge configuration object.

- Each Mailbox server also encrypts the ESBRA using its own public key and then stores the credentials in its own configuration object.

- EdgeSync replication accounts (ESRAs) are created in Active Directory for each Edge Transport-Mailbox server pair. Each Mailbox server stores its ESRA credentials as an attribute of the Mailbox server configuration object.
- Send connectors are automatically created to relay messages outbound from the Edge Transport server to the Internet, and inbound from the Edge Transport server to the Exchange organization. For more information, see the Send connectors created automatically by the Edge Subscription section in this topic.
- The Microsoft Exchange EdgeSync service that runs on Mailbox servers uses the ESBRA credentials to establish a secure LDAP connection between a Mailbox server and the Edge Transport server, and performs the initial replication of data. The following data is replicated to AD LDS:
  - Topology data
  - Configuration data
  - Recipient data
  - ESRA credentials
- The Microsoft Exchange Credential Service that runs on the Edge Transport server installs the ESRA credentials. These credentials are used to authenticate and secure later synchronization connections.
- The EdgeSync synchronization schedule is established.
- The Microsoft Exchange EdgeSync service running on the Mailbox servers in the subscribed Active Directory site then performs one-way replication of data from Active Directory to AD LDS on a regular schedule. You can also use the **Start-EdgeSynchronization** cmdlet to override the EdgeSync synchronization schedule and immediately start synchronization.

This example subscribes an Edge Transport server to the specified site and automatically creates the Internet Send connector and the Send connector from the Edge Transport server to the Mailbox servers.

```
New-EdgeSubscription -FileData ([byte[]]$(Get-Content -Path "C:\Data\EdgeSubscriptionInfo.xml" -Encoding Byte
-ReadCount 0)) -Site "Default-First-Site-Name"
```

> **NOTE**
>
> The default values of the *CreateInternetSendConnector* and *CreateInboundSendConnector* parameters are both `$true`, so you don't need to use them in this command.

Send connectors created automatically by the Edge Subscription

By default, when you import the Edge Subscription file to a Mailbox server, the Send connectors required to enable end-to-end mail flow between the Internet and the Exchange organization are created automatically, and any existing Send connectors on the Edge Transport server are deleted.

The Edge Subscription creates the following Send connectors:

- A Send connector named EdgeSync - Inbound to <*Site Name*> that's configured to relay messages from the Edge Transport server to the Exchange organization.
- A Send connector named EdgeSync - <*Site Name*> to Internet that's configured to relay messages from the Exchange organization to the Internet.

Also, subscribing an Edge Transport server to the Exchange organization allows the Mailbox servers in the subscribed Active Directory site to use the invisible and implicit intra-organization Send connector to relay messages to the Edge Transport server.

Inbound Send connector to receive messages from the Internet

When you run the **New-EdgeSubscription** cmdlet on the Mailbox server, the *CreateInboundSendConnector* parameter is set to the value `$true`. This creates the Send connector needed to send messages from the Edge Transport server to the Exchange organization. The following table shows the configuration of this Send connector.

Automatic inbound Send connector configuration

PROPERTY	VALUE
Name	EdgeSync - Inbound to < *Site Name*>
AddressSpaces	`SMTP:--;1` The `--` value in the address space represents all authoritative and internal relay accepted domains for the Exchange organization. Any messages the Edge Transport server receives for these accepted domains are routed to this Send connector and relayed to the smart hosts.
SourceTransportServers	< *Edge Subscription name*>
Enabled	True
DNSRoutingEnabled	False
SmartHosts	`--` The `--` value in the list of smart hosts represents all Mailbox servers in the subscribed Active Directory site. Any Mailbox servers you add to the subscribed Active Directory site after you establish the Edge Subscription don't participate in the EdgeSync synchronization process. However, they are automatically added to the list of smart hosts for the automatically created inbound Send connector. If more than one Mailbox server is located in the subscribed Active Directory site, inbound connections will be load balanced across the smart hosts.

You can't modify the address space or list of smart hosts at creation time for the automatically created inbound Send connector. However, you can set the *CreateInboundSendConnector* parameter to the value `$false` when you create an Edge Subscription. This allows you to manually configure a Send connector from the Edge Transport server to the Exchange organization.

Outbound Send connector to send messages to the Internet

When you run the **New-EdgeSubscription** cmdlet on the Mailbox server, the *CreateInternetSendConnector* parameter is set to the value `$true`. This creates the Send connector needed to send messages from the Exchange organization to the Internet. The following table shows the default configuration of this Send connector.

Automatic Internet Send connector configuration

PROPERTY	VALUE
Name	EdgeSync - < *Site Name*> to Internet
AddressSpaces	`SMTP:*;100`

PROPERTY	VALUE
SourceTransportServers	< *Edge Subscription name*> The name of the Edge Subscription is the same as the name of the subscribed Edge Transport server.
Enabled	True
DNSRoutingEnabled	True
DomainSecureEnabled	True

If more than one Edge Transport server is subscribed to the same Active Directory site, no additional Send connectors to the Internet are created. Instead, all Edge Subscriptions are added to the same Send connector as the source server. This load balances outbound connections to the Internet across the subscribed Edge Transport servers.

The outbound Send connector is configured to send email messages from the Exchange organization to all remote SMTP domains, using DNS routing to resolve domain names to MX resource records.

Details about the EdgeSync service

After you subscribe an Edge Transport server to an Active Directory site, EdgeSync will replicate configuration and recipient data to the Edge Transport servers. The service replicates the following data from Active Directory to AD LDS:

- Send connector configuration
- Accepted domains
- Remote domains
- Safe Senders Lists
- Blocked Senders Lists
- Recipients
- List of send and receive domains used in domain secure communications with partners
- List of SMTP servers listed as internal in your organization's transport configuration
- List of Mailbox servers in the subscribed Active Directory site

EdgeSync uses a mutually authenticated and authorized secure LDAP channel to transfer data from the Mailbox server to the Edge Transport server.

To replicate data to AD LDS, the Mailbox server binds to a global catalog server to retrieve updated data. EdgeSync initiates a secure LDAP session between a Mailbox server and the subscribed Edge Transport server over the non-standard TCP port 50636.

When you first subscribe an Edge Transport server to an Active Directory site, the initial replication that populates AD LDS with data from Active Directory can take five minutes or more, depending on the quantity of data in the directory service. After initial replication, EdgeSync only synchronizes new and changed objects, and removes any deleted objects.

Synchronization schedule

Different types of data synchronize on different schedules. The EdgeSync synchronization schedule specifies the maximum interval between EdgeSync synchronizations. EdgeSync synchronization occurs at the following intervals:

- Configuration data: 3 minutes.
- Recipient data: 5 minutes.
- Topology data: 5 minutes

If you want to change these intervals, use the **Set-EdgeSyncServiceConfig** cmdlet. Using the **Start-EdgeSynchronization** cmdlet on the Mailbox server to force Edge Subscription synchronization overrides the timer for the next scheduled EdgeSync synchronization, and starts EdgeSync immediately.

Selection of Mailbox servers

Each subscribed Edge Transport server is associated with a particular Active Directory site. If more than one Mailbox server exists in the site, any of these Mailbox servers can replicate data to the subscribed Edge Transport servers. To avoid contention among Mailbox servers when synchronizing, the preferred Mailbox server is selected as follows:

1. The first Mailbox server in the Active Directory site to perform a topology scan and discover the new Edge Subscription performs the initial replication. Because this discovery is based on the timing of the topology scan, any Mailbox server in the site may perform the initial replication.

2. The Mailbox server performing the initial replication establishes an EdgeSync lease option and sets a lock on the Edge Subscription. The lease option establishes that particular Mailbox server as the preferred server providing synchronization services to that Edge Transport server. The lock prevents EdgeSync running on another Mailbox server from taking over the lease option.

3. The EdgeSync lease option lasts for one hour. During that hour, no other EdgeSync service can take over the option unless a manual synchronization is started before the end of the hour. If the preferred Mailbox server isn't available to provide EdgeSync service at the time manual synchronization is started, after a five-minute wait, the lock is released and another EdgeSync service can take over the lease option and perform synchronization.

4. Unless manual synchronization is started, synchronization occurs based on the EdgeSync synchronization schedule. If the preferred server isn't available when a scheduled synchronization occurs, after a five-minute wait, the lock is released and another EdgeSync service can take over the lease option and perform synchronization.

This method of locking and leasing prevents more than one instance of EdgeSync from pushing data to the same Edge Transport server at the same time.

Notes:

- In Exchange 2016 organizations, if you also have Exchange 2010 Hub Transport servers in the subscribed Active Directory site, Exchange 2016 Mailbox servers will always take precedence and perform the replication.

- When you subscribe an Edge Transport server to an Active Directory site, all Mailbox servers installed in that Active Directory site at that time can participate in the EdgeSync synchronization process. If one of those servers is removed, the EdgeSync service that's running on the remaining Mailbox servers will continue the data synchronization process. However, if you later install new Mailbox servers in the Active Directory site, they won't automatically participate in EdgeSync synchronization. If you want to enable those new Mailbox servers to participate in EdgeSync synchronization, you will need to subscribe the Edge Transport server again.

The following table lists the EdgeSync properties related to locking and leasing. You can use the **Set-EdgeSyncServiceConfig** cmdlet to configure these properties.

EdgeSync lease properties

PARAMETER	DEFAULT VALUE	DESCRIPTION
LockDuration	`00:05:00` (5 minutes)	This setting determines how long a particular EdgeSync service will acquire a lock. If the EdgeSync service on the Mailbox server that's holding this lock doesn't respond, after five minutes the EdgeSync service on another Mailbox server will take over the lease. Forcing immediate EdgeSync synchronization doesn't override this setting.
OptionDuration	`01:00:00` (1 hour)	This setting determines how long an EdgeSync service can declare a lease option on an Edge Transport server. If the EdgeSync service holding the lease is unavailable and doesn't restart during this option period, no other Exchange EdgeSync service will take over the lease option unless you force EdgeSync synchronization.
LockRenewalDuration	`00:01:00` (1 minute)	This setting determines how frequently the lock field is updated when an EdgeSync service has acquired a lock to an Edge Transport server.

Procedures for Edge Subscriptions

8/3/2020 • 6 minutes to read • Edit Online

After you've subscribed an Edge Transport server to an Active Directory site in your Exchange organization as described in Edge Subscriptions, you might need to perform maintenance tasks on the Edge Subscription. These tasks are described in this topic.

What do you need to know before you begin?

- Estimated time to complete each procedure: 10 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "EdgeSync" entry and the "Edge Transport servers" section in the Mail flow permissions topic.

TIP

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Remove an Edge Subscription

You may occasionally want to remove an Edge Subscription from the Exchange organization or from both the Exchange organization and the Edge Transport server. If you plan to later resubscribe the Edge Transport server to the Exchange organization, don't remove the Edge Subscription from the Edge Transport server. When you remove the Edge Subscription from an Edge Transport server, all replicated data is deleted from AD LDS. This can take a long time if you have lots of recipient data.

To completely remove an Edge Subscription, you need to run this procedure on the Edge Transport server you wish to remove and on an Exchange 2016 or Exchange 2019 Mailbox server in the Active Directory site where the Edge Transport server is subscribed.

After you remove the Edge Subscription, synchronization of information from AD LDS stops. All accounts stored in AD LDS are removed, and the Edge Transport server is removed from the source server list of any Send connector. You will no longer be able to use Edge Transport server features that rely on Active Directory data.

1. To remove the Edge Subscription from the Edge Transport server, use the following syntax.

   ```
   Remove-EdgeSubscription <EdgeTransportServerIdentity>
   ```

   For example, to remove the Edge Subscription on the Edge Transport server named Edge01, run the following command.

   ```
   Remove-EdgeSubscription Edge01
   ```

2. To remove the Edge Subscription from the Mailbox server, use the following syntax.

   ```
   Remove-EdgeSubscription <EdgeTransportServerIdentity>
   ```

For example, to remove the Edge Subscription for the Edge Transport server named Edge01 on a Mailbox server in the subscribed Active Directory site, run the following command.

```
Remove-EdgeSubscription Edge01
```

You will need to remove the Edge Subscription if:

- You no longer want the Edge Transport server to participate in EdgeSync synchronization. You will need to remove the Edge Subscription from both the Edge Transport server and from the Exchange organization.
- An Edge Transport server is being decommissioned. In this scenario, you only need to remove the Edge Subscription from the Exchange organization. If you uninstall the Edge Transport server role from the computer, the AD LDS instance and all Active Directory data stored in AD LDS will also be removed.
- You want to change the Active Directory site association for the Edge Subscription. You will only need to remove the Edge Subscription from the Exchange organization. After the Edge Subscription is removed from the Exchange organization, you can resubscribe the Edge Transport server to a different Active Directory site.

When you remove an Edge Subscription from the Exchange organization:

- Synchronization of information from Active Directory to AD LDS stops.
- The ESRA accounts are removed from both Active Directory and AD LDS.
- The Edge Transport server is removed from the *SourceTransportServers* property of any Send connector.
- The automatic inbound Send connector from the Edge Transport server to the Exchange organization is removed from AD LDS.

When you remove the Edge Subscription from an Edge Transport server:

- You can no longer use Edge Transport server features that rely on Active Directory data.
- Replicated data is removed from AD LDS.
- Tasks that were disabled when the Edge Subscription was created are re-enabled to allow for local configuration.

Resubscribe an Edge Transport server

Occasionally you may have to resubscribe an Edge Transport server to an Active Directory site. When the Edge Subscription is re-created, new credentials are generated and you need to follow the complete Edge Subscription process. You will need to resubscribe an Edge Transport server if:

- You add new Mailbox servers in the subscribed Active Directory site, and you want the new Mailbox server to participate in EdgeSync synchronization.
- You applied the license key for the Edge Transport server after creating the Edge Subscription. Licensing information for the Edge Transport server is captured when the Edge Subscription is created. Subscribed Edge Transport servers only appear as licensed if they are subscribed to the Exchange organization after the license key has already been applied on the Edge Transport server. If the license key is applied on the Edge Transport server after you perform the Edge Subscription process, the licensing information won't be updated in the Exchange organization, and you will need to resubscribe the Edge Transport server.
- The ESRA credentials are compromised.

IMPORTANT

To resubscribe an Edge Transport server, export a new Edge Subscription file on the Edge Transport server and then import the XML file on a Mailbox server. You will need to resubscribe the Edge Transport server to the same Active Directory site where it was originally subscribed. You don't need to first remove the original Edge Subscription; the resubscription process will overwrite the existing Edge Subscription.

Add or Remove a Mailbox server

If you add a Mailbox server to an Active Directory site that already has an Edge Transport server subscribed, the new Mailbox server doesn't automatically participate in EdgeSync synchronization. To enable a newly deployed Mailbox server to participate in EdgeSync synchronization, you need to resubscribe each Edge Transport server to the Active Directory site.

Removing a Mailbox server from an Active Directory site where an Edge Transport server is subscribed won't affect EdgeSync synchronization unless that Mailbox server is the only Mailbox server in that site. If you remove all Mailbox servers from the Active Directory site where an Edge Transport server is subscribed, that site's subscribed Edge Transport servers are orphaned.

Run EdgeSync manually

You may want to manually run EdgeSync if you've made significant changes to the configuration or recipients in Active Directory and want your changes synchronized immediately. You can run a full synchronization, or only synchronize changes made since the last replication.

A manual EdgeSync resets the EdgeSync synchronization schedule. The next automatic synchronization is based on when you ran the manual synchronization.

To manually run EdgeSync, use the following syntax.

```
Start-EdgeSynchronization [-Server <MailboxServerIdentity>] [-TargetServer <EdgeTransportServerIdentity> [-ForceFullSync]
```

The following example starts EdgeSync with the following options:

- The synchronization is initiated from the Exchange Mailbox server named Mailbox01.
- All Edge Transport servers are synchronized.
- Only the changes since the last replication are synchronized.

```
Start-EdgeSynchronization -Server Mailbox01
```

This example starts EdgeSync with the following options:

- The synchronization is initiated from the local Mailbox server.
- Only the Edge Transport server named Edge03 is synchronized.
- All recipient and configuration data are fully synchronized.

```
Start-EdgeSynchronization -TargetServer Edge03 -ForceFullSync
```

Verify EdgeSync results

You can use the **Test-EdgeSynchronization** cmdlet to verify that the Edge synchronization is working. This cmdlet reports synchronization status of subscribed Edge Transport servers.

The output of this cmdlet lets you view objects that have not been synchronized to the Edge Transport server. The task compares data stored in Active Directory against data stored in AD LDS and reports any data inconsistencies.

You can use the *ExcludeRecipientTest* parameter on the **Test-EdgeSynchronization** cmdlet to exclude validation of recipient data synchronization. If you include this parameter, only the synchronization of configuration objects is validated. Validating recipient data will take longer than validating only configuration data.

Verify EdgeSync results for a single recipient

To verify EdgeSync results for a single recipient, use the following syntax on a Mailbox server in the subscribed Active Directory site.

```
Test-EdgeSynchronization -VerifyRecipient <emailaddress>
```

This example verifies EdgeSync results for the user kate@contoso.com.

```
Test-EdgeSynchronization -VerifyRecipient kate@contoso.com
```

Configure internet mail flow through Edge Transport servers without using EdgeSync

8/3/2020 • 10 minutes to read • Edit Online

We recommend that you use the Edge Subscription process to establish mail flow between your Exchange organization and an Edge Transport server as described in Edge Subscriptions. However, certain situations may prevent you from subscribing the Edge Transport server to your Exchange organization. To manually establish mail flow between your Exchange organization and an unsubscribed Edge Transport server, you need to manually create and/or modify the following Send connectors and Receive connectors:

On the Edge Transport server:

- Create a dedicated Send connector to only send messages to the internet.
- Create a dedicated Send connector to only send messages to Mailbox servers in the Exchange organization.[1]
- Create a dedicated Receive connector to only receive messages from Mailbox servers in the Exchange organization[2]
- Modify the default Receive connector to only accept messages only from the internet.

On a Mailbox server:

- Create a dedicated Send connector to relay outgoing messages to the Edge Transport server

[1]The Send connector that's created by an EdgeSync subscription for delivering email into the Exchange organization is configured to use Exchange Server (GSSAPI) authentication. The EdgeSync subscription identifies the Edge Transport server as an Exchange server to the internal Active Directory forest, which also allows Exchange Server authentication. By definition, there is no EdgeSync subscription in this scenario, so you'll need to improvise:

- You can configure Basic authentication over TLS to provide authentication and encryption for email traffic between the Edge Transport server and the internal Exchange organization. This method has the following issues:
  - You need to configure an Active Directory account that belongs to the Exchange Servers universal security group for authentication on the Send connector that relays messages from the Edge Transport server to the internal Exchange organization. Be sure to safeguard the account credentials, and you can configure the account to allow logon only to specific computers. You also need a local account on the Edge Transport server for authentication on the Send connector that relays messages from the internal Exchange organization to the Edge Transport server.
  - Messages coming from these Send connectors will be seen as authenticated SMTP by the destination Mailbox server. This means the default Receive connector named Client Frontend <ServerName> in the Front End Transport service will accept the messages on port 587, and the messages are accepted in the backend Transport service using the default Receive connector named Client Proxy <ServerName> on port 465.
  - To provide encryption, you need to use a certificate. The self-signed certificate on the Edge Transport server won't be recognized by the internal Exchange Organization (again, the EdgeSync subscription usually takes care of this). You'll need to manually import the self-signed certificate on each Mailbox or use a certificate from a trusted third-party certification authority.
- If you don't want the messages coming from the Edge Transport server to be identified as authenticated

SMTP and therefore using the corresponding client Receive connectors, you can use Externally Secured as the authentication method, which means email traffic between the Edge Transport server and the internal Exchange organization isn't authenticated or encrypted *by Exchange*. If you use this method, you **must** configure and use an external encryption method (for example, IPsec or a VPN).

[2]Instead of a dedicated Receive connector, you can configure and use the default Receive connector on the Edge Transport server for both incoming internet messages and incoming messages from internal Mailbox servers (an EdgeSync subscription uses this Receive connector for both connections).

For more information about Send connectors, see Send connectors. For more information about Receive connectors, see Receive connectors.

Before you begin

- Estimated time to complete this task: 30 minutes.

- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Send connectors" entry, the "Send connectors - Edge Transport" entry, and the "Receive connectors - Edge Transport" entry in the Mail flow permissions topic.

- On Edge Transport servers, you can only use the Exchange Management Shell to create Send connectors and Receive connectors. On Mailbox servers, you can use the Exchange admin center (EAC) or the Exchange Management Shell to create Send connectors.

  To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.

  For information about opening and using the EAC, see Exchange admin center in Exchange Server.

- The basic configuration of an Edge Transport server in the perimeter network must allow for resolving public domains for internet email and internal host names for internal email. There are different ways to do this, but you can configure the network adapter that's connected to the external (public) network segment to use a public DNS server, and configure the network adapter that's connected to the internal (private) network segment to use a DNS server in the perimeter network.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

Edge Transport Server Procedures

Step 1: Create a dedicated Send connector to only send messages to the internet

This Send connector requires the following configuration:

- **Name**: To Internet (or any descriptive name)

- **Usage type**: Internet

- **Address spaces**: "*" (all domains)

- **Network settings**: Use DNS MX records to route mail automatically. Depending on your network configuration, you can also route mail through a smart host. The smart host then routes mail to the internet.

To create a Send connector that's configured to send messages to the internet, run this command:

```
New-SendConnector -Name "To Internet" -AddressSpaces * -Usage Internet -DNSRoutingEnabled $true
```

For detailed syntax and parameter information, see New-SendConnector.

Step 2: Create a dedicated Send connector to only send messages to the Exchange organization

This Send connector requires the following configuration:

- **Name**: To Internal Org (or any descriptive name)
- **Usage type**: Internal
- **Address spaces**: `--` (indicates all accepted domains for the Exchange organization)
- DNS routing disabled (smart host routing enabled)
- **Smart hosts**: FQDN of one or more Mailbox servers as smart hosts. For example, mbxserver01.contoso.com and mbxserver02.contoso.com.
- **Smart host authentication methods**: Basic authentication over TLS
- **Smart host authentication credentials**: Credentials for the user account in the internal domain that's a member of the Exchange Servers universal security group. You need to use the **Get-Credential** cmdlet to store the credentials. Use the format *<Domain>*\ *<UserName>* or the user principal name (UPN; for example, chris@contoso.com) to enter the username.

To create a Send connector configured to send messages to the Exchange organization, replace the smart host values with the Mailbox servers in your organization, and run this command:

```
New-SendConnector -Name "To Internal Org" -Usage Internal -AddressSpaces "--" -DNSRoutingEnabled $false -
SmartHosts mbxserver01.contoso.com,mbxserver02.contoso.com -SmartHostAuthMechanism BasicAuthRequireTLS -
AuthenticationCredential (Get-Credential)
```

For detailed syntax and parameter information, see New-SendConnector.

Step 3: Modify the default Receive connector to only accept messages from the internet

Make the following configuration changes to the default Receive connector:

- Modify the name to indicate that the connector will be used solely to receive email from the internet (the default name is Default internal receive connector *<ServerName>*).
- Change the network bindings to accept messages only from the network adapter that is accessible from the internet (for example, 10.1.1.1 and the standard SMTP TCP port value of 25).

To modify the default Receive connector to only accept messages from the internet, replace *< ServerName>* and bindings ith the name of your Edge Transport server and external network adapter configuration, and run this command:

```
Set-ReceiveConnector -Identity "Default internal Receive connector ServerName>" -Name "From Internet" -Bindings
10.1.1.1:25
```

For detailed syntax and parameter information, see Set-ReceiveConnector.

Step 4: Create a dedicated Receive connector to only accept messages from the Exchange organization

This Receive connector requires the following configuration:

- **Name**: From Internal Org (or any descriptive name)

- **Usage type**: Internal
- **Local network bindings**: Internal network-facing network adapter (for example, 10.1.1.2 and the standard SMTP TCP port value of 25).
- **Remote network settings**: IP address of one or more Mailbox servers in the Exchange organization. For example, 192.168.5.10 and 192.168.5.20.
- **Authentication methods**: TLS, Basic authentication, Basic authentication over TLS, and Exchange Server authentication.

To create a Receive connector configured to only accept messages from the Exchange organization, replace the bindings and remote IP ranges with your values, and run this command.

```
New-ReceiveConnector -Name "From Internal Org" -Usage Internal -AuthMechanism
TLS,BasicAuth,BasicAuthRequireTLS,ExchangeServer -Bindings 10.1.1.2:25 -RemoteIPRanges
192.168.5.10,192.168.5.20
```

For detailed syntax and parameter information, see New-ReceiveConnector.

How do you know this worked?

To verify that you have successfully configured the required Send connectors and Receive connectors on the Edge Transport server, run this command on the Edge Transport server and verify the property values:

```
Get-SendConnector | Format-List
Name,Usage,AddressSpaces,SourceTransportServers,DSNRoutingEnabled,SmartHosts,SmartHostAuthMechanism; Get-
ReceiveConnector | Format-List Name,Usage,AuthMechanism,Bindings,RemoteIPRanges
```

Mailbox server procedures

You don't need to modify the default Receive connectors on Mailbox servers. For more information about default Receive connectors on Mailbox servers, see Default Receive connectors created during setup.

Step 5: Create a dedicated Send connector to send outgoing messages to the Edge Transport server

This Send connector requires the following configuration:

- **Name**: To Edge (or any descriptive name)
- **Usage type**: Internal
- **Address spaces**: "*" (all external domains)
- DNS routing disabled (smart host routing enabled)
- **Smart hosts**: IP address or FQDN of the Edge Transport server. For example, edge01.contoso.net.
- **Source servers**: FQDN of one or more Mailbox servers. For example, mbxserver01.contoso.com and mbxserver02.contoso.com.
- **Smart host authentication methods**: Basic authentication over TLS.
- **Smart host authentication credentials**: Credentials for the user account on the Edge Transport server.

Use the EAC to create a Send connector to send outgoing messages to the Edge Transport server

1. In the EAC, go to **Mail flow** > **Send connectors**, and then click **Add** +. This starts the **New Send connector** wizard.
2. On the first page, configure these settings:

   - **Name**: Enter To Edge.

   - **Type**: Select **Internal**.

   Click **Next**.

3. On the next page, select **Route mail through smart hosts**, and then click **Add** +. In the **Add smart host** dialog box that appears, identify the Edge Transport server by using one of these values:

   - **IP address**: For example, 10.1.1.2.

   - **Fully qualified domain name (FQDN)**: For example, edge01.contoso.net. Note that the source Mailbox servers for the Send connector must be able to resolve the Edge Transport server in DNS by using this FQDN. If they can't, use the IP address instead.

   Click **Save**.

4. On the next page, in the **Smart host authentication** section, select **Basic authentication**, and then configure these additional settings:

   - Select **Offer basic authentication only after starting TLS**

   - In the **User name** and **Password** fields, enter the credentials for the local user account on the Edge Transport server.

   Click **Next**.

5. On the next page, in the **Address space** section, click **Add** +. In the **Add domain** dialog box that appears, enter the following information:

   - **Type**: Verify SMTP is selected.

   - **Fully Qualified Domain Name (FQDN)**: Enter an asterisk (*) to indicate the Send connector is used for all external domains.

   - **Cost**: Verify 1 is entered. A lower value indicates a more preferred route.

   Click **Save**.

6. Back on the previous page, the **Scoped send connector** setting is important if your organization has Exchange servers installed in multiple Active Directory sites:

   - If you don't select **Scoped send connector**, the connector is usable by all transport servers (Exchange 2019 Mailbox servers, Exchange 2016 Mailbox servers, Exchange 2013 Mailbox servers, and Exchange 2010 Hub Transport servers) in the entire Active Directory forest. This is the default value.

   - If you select **Scoped send connector**, the connector is only usable by other transport servers in the same Active Directory site.

   Click **Next**.

7. On the next page, in the **Source server** section, click **Add** +. In the **Select a Server** dialog box that appears, select one or more Mailbox servers that you want to use to send outgoing mail through the Edge Transport server. Select a Mailbox server and click **Add ->** (repeat as many times a necessary), click **OK**, and then click **Finish**.

Use the Exchange Management Shell to create a Send connector to send outgoing messages to the Edge Transport server

To create a Send connector to send outgoing messages to the Edge Transport server, replace the smart hosts and source Mailbox servers with your values, and run this command:

```
New-SendConnector -Name "To Edge" -Usage Internal -AddressSpaces * -DNSRoutingEnabled $false -SmartHosts
edge01.contoso.com -SourceTransportServers mbxserver01.contoso.com,mbxserver02.contoso.com -
SmartHostAuthMechanism BasicAuthRequireTLS -AuthenticationCredential (Get-Credential)
```

For detailed syntax and parameter information, see New-SendConnector.

How do you know this worked?

To verify that you've successfully created a Send connector to send outgoing messages to the Edge Transport server, use either of these steps:

- In the EAC, go to **Mail flow** > **Send connectors**, select the Send connector named To Edge > click **Edit** ✎, and verify the property values.

- In the Exchange Management Shell, run this command on a Mailbox server to verify the property values:

  ```
  Get-SendConnector -Identity "To Edge" | Format-List
  Usage,AddressSpaces,DSNRoutingEnabled,SmartHosts,SourceTransportServers,SmartHostAuthMechanism
  ```

Address rewriting on Edge Transport servers

8/3/2020 • 9 minutes to read • Edit Online

Address rewriting in Exchange Server modifies the email addresses of senders and recipients in messages that enter or leave your organization through an Edge Transport server. Two transport agents on the Edge Transport server provide the rewriting functionality: the Address Rewriting Inbound Agent and the Address Rewriting Outbound Agent. The primary reason for address rewriting on outbound messages is to present a single, consistent email domain to external recipients. The primary reason for address rewriting on inbound messages is to deliver messages to the correct recipient.

The *address rewrite entry*, which you create, specifies the internal addresses (the email addresses you want to change) and the external addresses (the final email addresses you want). You can specify whether email addresses are rewritten in inbound and outbound messages, or in outbound messages only. You can create address writing entries for a single user (chris@contoso.com to support@contoso.com), a single domain (contoso.com to fabrikam.com), or for multiple subdomains with exceptions (*.fabrikam.com to contoso.com, except legal.fabrikam.com).

> **IMPORTANT**
> Regardless of how you plan to use address rewriting, you need to verify that the resulting email addresses are unique in your organization so you don't end up with duplicates. Address rewriting doesn't verify the uniqueness of a rewritten email address.

To configure address rewriting, see Address rewriting procedures on Edge Transport servers.

Scenarios for address rewriting

The following scenarios are examples of how you can use address rewriting:

- **Group consolidation**: Some organizations segment their internal businesses into separate domains that are based on business or technical requirements. This configuration can cause email messages to appear as if they come from separate groups or even separate organizations.

  The following example shows how an organization, Contoso, Ltd., can hide its internal subdomains from external recipients:

  - Outbound messages from the northamerica.contoso.com, europe.contoso.com, and asia.contoso.com domains are rewritten so they appear to originate from a single contoso.com domain. All messages are rewritten as they pass through Edge Transport servers that provide SMTP connectivity between the whole organization and the Internet.

  - Inbound messages to contoso.com recipients are relayed by the Edge Transport server to a Mailbox server. The message is delivered to the correct recipient based on the proxy address that's configured on the recipient's mailbox.

- **Mergers and acquisitions**: An acquired company might continue to run as a separate business, but you can use address rewriting to make the two organizations appear as if they're one integrated organization.

  The following example shows how Contoso, Ltd. can hide the email domain of the newly acquired company, Fourth Coffee:

  - Contoso, Ltd. wants all outbound messages from Fourth Coffee's Exchange organization to appear as if they originate from contoso.com. All messages from both organizations are sent through the Edge Transport servers at Contoso, Ltd., where email messages are rewritten from *user*@fourthcoffee.com to *user*@contoso.com.

    - Inbound messages to *user*@contoso.com are rewritten and routed to *user*@fourthcoffee.com mailboxes. Inbound messages that are sent to *user*@fourthcoffee.com are routed directly to Fourth Coffee's email servers.

- **Partners**: Many organizations use external partners to provide services for their customers, other organizations, or their own organization. To avoid confusion, the organization might replace the email domain of the partner organization with its own email domain.

  The following example shows how Contoso, Ltd. can hide a partner's email domain:

    - Contoso, Ltd. provides support for the larger Wingtip Toys organization. Wingtip Toys wants a unified email experience for its customers, and it requires all messages from support personnel at Contoso, Ltd. to appear as if they were sent from Wingtip Toys. All outbound messages that relate to Wingtip Toys are sent through their Edge Transport servers, and all contoso.com email addresses are rewritten to wingtiptoys.com email addresses.

    - Inbound messages for support@wingtiptoys.com are accepted by Wingtip Toy's Edge Transport servers, rewritten, and then routed to the support@contoso.com email address.

Message properties modified by address rewriting

A standard SMTP email message consists of a *message envelope* and message content. The message envelope contains information that's required for transmitting and delivering the message between SMTP messaging servers. The message content contains message header fields (collectively called the *message header*) and the message body. The message envelope is described in RFC 2821, and the message header is described in RFC 2822.

When a sender composes an email message and submits it for delivery, the message contains the basic information that's required to comply with SMTP standards, such as a sender, a recipient, the date and time that the message was composed, an optional subject line, and an optional message body. This information is contained in the message itself and, by definition, in the message header.

The sender's mail server generates a message envelope for the message by using the sender's and recipient's information found in the message header. It then transmits the message to the Internet for delivery to the recipient's messaging server. Recipients never see the message envelope because it's generated by the message transmission process, and it isn't actually part of the message.

Address rewriting changes an email address by rewriting specific fields in the message header or message envelope. Address rewriting changes several fields in outbound messages, but only one field in inbound email messages. The following table shows which SMTP header fields are rewritten in outbound and inbound messages.

Message fields rewritten on outbound and inbound messages

FIELD NAME	LOCATION	OUTBOUND MESSAGES	INBOUND MESSAGES
MAIL FROM	Message envelope	Rewritten	Not rewritten
RCPT TO	Message envelope	Not rewritten	Rewritten
To	Message header	Not Rewritten	Rewritten
Cc	Message header	Not Rewritten	Rewritten

FIELD NAME	LOCATION	OUTBOUND MESSAGES	INBOUND MESSAGES
From	Message header	Rewritten	Not rewritten
Sender	Message header	Rewritten	Not rewritten
Reply-To	Message header	Rewritten	Not rewritten
Return-Receipt-To	Message header	Rewritten	Not rewritten
Disposition-Notification-To	Message header	Rewritten	Not rewritten
Resent-From	Message header	Rewritten	Not rewritten
Resent-Sender	Message header	Rewritten	Not rewritten

What address rewriting doesn't change

Address rewriting doesn't modify any message header fields that would break SMTP functionality. For example, modifying certain header fields can affect routing loop detection, invalidate the digital signature, or make a rights-protected message unreadable. Therefore, the following header fields aren't modified by address rewriting.

- **Return-Path**
- **Received**
- **Message-ID**
- **X-MS-TNEF-Correlator**
- **Content-Type Boundary=string**
- Header fields located inside MIME body parts

Address rewriting ignores domains that aren't controlled by the Exchange organization. In other words, the domain needs to be configured as an authoritative accepted domain in the Exchange organization. Rewriting non-authoritative domains would cause an uncontrollable form of message relay.

Address rewriting also doesn't modify the header fields of messages that are embedded in another message. Senders and recipients expect embedded messages to remain intact and be delivered without modification, as long as the messages don't trigger mail flow rules (also known as transport rules) that are implemented between the sender and recipient.

Considerations for outbound-only address rewriting

Outbound-only address rewriting on an Edge Transport server modifies the sender's email address as messages leave the Exchange organization. You can configure outbound-only address rewriting for a single user (chris@contoso.com to support@contoso.com), or for a single domain (contoso.com to fabrikam.com). You are required to configure outbound-only address rewriting for multiple subdomains (*.fabrikam.com to contoso.com).

The rewritten email address needs to be configured as a proxy address on the affected recipients. For example, if laura@sales.contoso.com is rewritten to laura@contoso.com, the proxy address laura@contoso.com needs to be configured on Laura's mailbox. This allows replies and inbound messages to be delivered correctly.

Considerations for inbound and outbound address rewriting

Inbound and outbound, or *bidirectional* address rewriting on an Edge Transport server modifies the sender's email address as messages leave the Exchange organization, and the recipient's email address as messages enter the Exchange organization.

You can configure bidirectional address rewriting for a single user (chris@contoso.com to support@contoso.com), and a single domain (contoso.com to fabrikam.com). You can't configure bidirectional address rewriting for multiple subdomains (*.fabrikam.com to contoso.com).

Considerations for rewriting email addresses in multiple domains

When you flatten multiple internal domains or subdomains into a single external domain, you need to consider the following factors:

- **Verify unique aliases**: All email aliases (the part to the left of the @ sign) need to be unique across all subdomains. For example, if there is a joe@sales.contoso.com, there can't be a joe@marketing.contoso.com because the rewritten email address for both users would be joe@contoso.com.
- **Add proxy addresses**: The rewritten email address needs to be configured as a proxy address on all affected senders in the affected domains. For example, if joe@sales.contoso.com is rewritten to joe@contoso.com, you need to add the proxy address joe@contoso.com to Joe's mailbox. This allows replies and inbound messages to be delivered correctly.
- **Mail contacts for non-Exchange organizations**: If you're rewriting email addresses from a non-Exchange email system, you need to create mail contacts in Exchange to represent the users in the non-Exchange email system. These email contacts need to contain the original email addresses and the rewritten email addresses. For example, if joe@unix.contoso.com is rewritten to joe@contoso.com, you need to create a mail contact with joe@unix.contoso.com as the external email address and joe@contoso.com as a proxy address.

Verify unique aliases

When you rewrite email addresses in multiple subdomains, you need to make sure that all email aliases are unique across all your subdomains. For example, consider the following configuration:

The following users are in the subdomains sales.contoso.com, marketing.contoso.com, and research.contoso.com:

- maria@sales.contoso.com
- chris@sales.contoso.com
- david@marketing.contoso.com
- brian@marketing.contoso.com
- chris@research.contoso.com
- adam@research.contoso.com

Suppose you want to rewrite the subdomains sales.contoso.com, marketing.contoso.com, and research.contoso.com into the single domain contoso.com.

When the email addresses in each subdomain are rewritten, a conflict occurs between chris@sales.contoso.com and chris@research.contoso.com, because both email addresses are rewritten to chris@contoso.com. To resolve this issue, you need to change the email address of one of the affected recipients. For example, you can change chris@research.contoso.com to christopher@research.contoso.com so the email address is rewritten to christopher@contoso.com.

Priority of address rewrite entries

If a user's email address matches multiple address rewrite entries, the email address is only rewritten once based on the closest match. The following list describes the order of precedence of address rewrite entries from highest priority to lowest priority:

1. **Individual email addresses**: An address rewrite entry is configured to rewrite the email address of john@contoso.com to support@contoso.com.

2. **Domain or subdomain mapping**: An address rewrite entry is configured to rewrite all contoso.com email addresses to northwindtraders.com or all sales.contoso.com email addresses to contoso.com.

3. **Domain flattening**: An address rewrite entry is configured to rewrite *.contoso.com email addresses to contoso.com.

For example, consider an Edge Transport server where the following outbound address rewrite entries are configured:

- *.contoso.com email addresses are rewritten to contoso.com

- japan.sales.contoso.com email addresses are rewritten to contoso.jp

If masato@japan.sales.contoso.com sends an email message, the address is rewritten to masato@contoso.jp, because that entry most closely matches the sender's email address.

Digitally signed, encrypted, and rights-protected messages

Address rewriting shouldn't affect most signed, encrypted, or rights-protected messages. If address rewriting were to invalidate or otherwise change the security status of these types of messages in any way, address rewriting isn't applied.

The following values can be rewritten because the information isn't part of message signing, encryption, or rights protection:

- Fields in the message envelope.

- Top-level message body headers.

The following values aren't rewritten because the information is part of message signing, encryption, or rights protection:

- Header fields located inside MIME body parts that may be signed.

- The boundary string parameter of the MIME content type.

Address rewriting procedures on Edge Transport servers

8/3/2020 • 8 minutes to read • Edit Online

You can create address rewrite entries on Edge Transport servers that apply to a single recipient, a specific domain or subdomain, or multiple subdomains. Address rewriting can be outbound only, or inbound and outbound (bidirectional). When you create address rewrite entries, remember the following:

- Verify that the resulting email addresses are unique in your organization.
- Only literal strings are supported in the email address values.
- The wildcard character (*) is supported only in the internal address (the addresses you want to change). Valid syntax for using the wildcard character is ***.contoso.com**. The values ***contoso.com** or **sales.*.com** are not allowed.
- When you use the wildcard character, you need to configure the address rewriting as outbound only (you need to set the *OutboundOnly* parameter to the value `$true`), and outbound only address rewriting requires that you configure the rewritten email address as a proxy address on the affected recipients.
- By default, address rewriting is bidirectional for a single recipient, or for a specific domain or subdomain (the default value for the *OutboundOnly* parameter is `$false`).

For more information about address rewriting, see Address rewriting on Edge Transport servers.

What do you need to know before you begin?

- Estimated time to complete each procedure: 10 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Edge Transport servers" section in the Mail flow permissions topic.
- You can only use PowerShell to perform this procedure. To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.
- Be careful when you configure address rewriting. Any changes that you make are immediately applied when you run the command. Consider running the command with the *WhatIf* parameter. For more information about the *WhatIf* parameter, see WhatIf and Confirm.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the Exchange Management Shell to enable or disable address rewriting

To completely enable or disable address rewriting, you enable or disable the address rewriting agents. By default, the address rewriting agents on an Edge Transport server are enabled.

To disable address rewriting, run the following command:

```
Disable-TransportAgent "Address Rewriting Inbound Agent"; Disable-TransportAgent "Address Rewriting Outbound
Agent"
```

To enable address rewriting, run the following command:

```
Enable-TransportAgent "Address Rewriting Inbound Agent"; Enable-TransportAgent "Address Rewriting Outbound
Agent"
```

How do you know this worked?

To verify that you have successfully enabled or disabled address rewriting, run the following command to verify the **Enabled** property value:

```
Get-TransportAgent "Address Rewriting *"
```

Use the Exchange Management Shell to view address rewrite entries

To view a summary list of all address rewrite entries, run the following command.

```
Get-AddressRewriteEntry
```

To view details of an address rewrite entry, use the following syntax.

```
Get-AddressRewriteEntry <AddressRewriteEntryIdentity> | Format-List
```

The following example displays the details of the address rewrite entry named Rewrite Contoso.com to Northwindtraders.com:

```
Get-AddressRewriteEntry "Rewrite Contoso.com to Northwindtraders.com" | Format-List
```

For more information, see Get-AddressRewriteEntry.

Use the Exchange Management Shell to create address rewrite entries

Rewrite the email address for a single recipient

To rewrite the email address for a single recipient, use the following syntax:

```
New-AddressRewriteEntry -Name "<Descriptive Name>" -InternalAddress <internal email address> -ExternalAddress
<external email address> [-OutboundOnly <$true | $false>]
```

This example rewrites the email address of all messages entering and leaving the Exchange organization for joe@contoso.com. Outbound messages are rewritten so they appear to come from support@nortwindtraders.com. Inbound messages sent to support@northwindtraders.com are rewritten to joe@contoso.com for delivery to the recipient (the *OutboundOnly* parameter is `$false` by default).

```
New-AddressRewriteEntry -Name "joe@contoso.com to support@northwindtraders.com" -InternalAddress
joe@contoso.com -ExternalAddress support@northwindtraders.com
```

Rewrite email addresses in a single domain or subdomain

To rewrite the email addresses in a single domain or subdomain, use the following syntax:

```
New-AddressRewriteEntry -Name "<Descriptive Name>" -InternalAddress <domain or subdomain> -ExternalAddress
<domain> [-OutboundOnly <$true | $false>]
```

This example rewrites the email addresses of all messages entering and leaving the Exchange organization for the contoso.com domain. Outbound messages are rewritten so they appear to come from the fabrikam.com domain. Inbound messages sent to fabrikam.com email addresses are rewritten to contoso.com for delivery to the recipients (the *OutboundOnly* parameter is `$false` by default).

```
New-AddressRewriteEntry -Name "Contoso to Fabrikam" -InternalAddress contoso.com -ExternalAddress fabrikam.com
```

This example rewrites the email addresses of all messages leaving the Exchange organization for the sales.contoso.com subdomain. Outbound messages are rewritten so they appear to come from the contoso.com domain. Inbound messages sent to contoso.com email addresses aren't rewritten.

```
New-AddressRewriteEntry -Name "sales.contoso.com to contoso.com" -InternalAddress sales.contoso.com -
ExternalAddress contoso.com -OutboundOnly $true
```

Rewrite email addresses in multiple subdomains

To rewrite the email addresses in a domain and all subdomains, use the following syntax.

```
New-AddressRewriteEntry -Name "<Descriptive Name>" -InternalAddress *.<domain> -ExternalAddress <domain> -
OutboundOnly $true [-ExceptionList <domain1,domain2...>]
```

This example rewrites the email addresses of all messages leaving the Exchange organization for the contoso.com domain and all subdomains. Outbound messages are rewritten so they appear to come from the contoso.com domain. Inbound messages sent to contoso.com recipients can't be rewritten, because a wildcard is used in the *InternalAddress* parameter.

```
New-AddressRewriteEntry -Name "Rewrite all contoso.com subdomains" -InternalAddress *.contoso.com -
ExternalAddress contoso.com -OutboundOnly $true
```

This example is just like the previous example, except now messages sent from the legal.contoso.com and corp.contoso.com subdomains are never rewritten:

```
New-AddressRewriteEntry -Name "Rewrite all contoso.com subdomains except legal.contoso.com and
corp.contoso.com" -InternalAddress *.contoso.com -ExternalAddress contoso.com -OutboundOnly $true -
ExceptionList legal.contoso.com,corp.contoso.com
```

For more information, see New-AddressRewriteEntry.

How do you know this worked?

To verify that you have successfully created address rewrite entries, do the following:

1. Replace *<AddressRewriteEntryIdentity>* with the name of the address rewrite entry, and run the following

command to verify the property values:

```
Get-AddressRewriteEntry <AddressRewriteEntryIdentity> | Format-List
```

2. From a mailbox that's affected by the address rewrite entry, send a test message to an external mailbox. Verify the test message appears to originate from the rewritten email address.

3. Reply to the test message from the external mailbox. Verify the original mailbox receives the reply.

Use the Exchange Management Shell to modify address rewrite entries

The configuration options that are available when you modify an existing address rewrite entry are identical to the configuration options when you create a new address rewrite entry.

Modify an address rewrite entry for a single recipient

To modify an address rewrite entry that rewrites the email address of a single recipient, use the following syntax:

```
Set-AddressRewriteEntry <AddressRewriteEntryIdentity> [-Name "<Descriptive Name>"] [-InternalAddress <internal
email address>] [-ExternalAddress <external email address>] [-OutboundOnly <$true | $false>]
```

This example modifies the following properties of the address rewrite entry named "joe@contoso.com to support@nortwindtraders.com":

- Changes the external address to support@northwindtraders.net.

- Changes the name of the address rewrite entry to "joe@contoso.com to support@northwindtraders.net".

- Changes the value of *OutboundOnly* to `$true`. Note that this change requires you to configure support@northwindtraders.net as a proxy address on Joe's mailbox.

```
Set-AddressRewriteEntry "joe@contoso.com to support@nortwindtraders.com" -Name "joe@contoso.com to
support@northwindtraders.net" -ExternalAddress support@northwindtraders.net -OutboundOnly $true
```

Modify an address rewrite entry for a single domain or subdomain

To modify an address rewrite entry that rewrites the email addresses from a single domain or subdomain, use the following syntax.

```
Set-AddressRewriteEntry <AddressRewriteEntryIdentity> [-Name "<Descriptive Name>"] [-InternalAddress <domain
or subdomain>] [-ExternalAddress <domain>] [-OutboundOnly <$true | $false>]
```

This example changes the internal address value of the address rewrite entry named "Northwind Traders to Contoso".

```
Set-AddressRewriteEntry "Northwindtraders to Contoso" -InternalAddress northwindtraders.net
```

Modify an address rewrite entry for multiple subdomains

To modify an address rewrite entry that rewrites the email addresses in a domain and all subdomains, use the following syntax.

```
Set-AddressRewriteEntry <AddressRewriteEntryIdentity> [-Name "<Descriptive Name>"] [-InternalAddress *.
<domain>] [-ExternalAddress <domain>] [-ExceptionList <list of domains>]
```

To replace the existing exception list values of an address rewrite entry, use the following syntax:

```
Set-AddressRewriteEntry <AddressRewriteEntryIdentity> -ExceptionList <domain1,domain2,...>
```

This example replaces the existing exception list for the address rewrite entry named Contoso to Northwind Traders with the values marketing.contoso.com and legal.contoso.com:

```
Set-AddressRewriteEntry "Contoso to Northwind Traders" -ExceptionList sales.contoso.com,legal.contoso.com
```

To add or remove exception list values without affecting other exception list entries, use the following syntax:

```
Set-AddressRewriteEntry <AddressRewriteEntryIdentity> -ExceptionList @{Add="<domain1>","<domain2>"...;
Remove="<domain3>","<domain4>"...}
```

This example adds finanace.contoso.com and removes marketing.contoso.com from the exception list of the address rewrite entry named Contoso to Northwind Traders:

```
Set-AddressRewriteEntry "Contoso to Northwind Traders" -ExceptionList @{Add="finanace.contoso.com";
Remove="marketing.contoso.com"}
```

For more information, see Set-AddressRewriteEntry.

How do you know this worked?

To verify that you have successfully modified an address rewrite entry, do the following:

1. Replace *<AddressRewriteEntryIdentity>* with the name of the address rewrite entry, and run the following command to verify the property values:

   ```
   Get-AddressRewriteEntry <AddressRewriteEntryIdentity> | Format-List
   ```

2. From a mailbox that's affected by the address rewrite entry, send a test message to an external mailbox. Verify the test message appears to originate from the rewritten email address.

3. From the external mailbox, reply to the test message. Verify the original mailbox receives the reply.

Use the Exchange Management Shell to remove address rewrite entries

To remove a single address rewrite entry, use the following syntax:

```
Remove-AddressRewriteEntry <AddressRewriteEntryIdentity>
```

This example removes the address rewrite entry named "Contoso.com to Northwindtraders.com":

```
Remove-AddressRewriteEntry "Contoso.com to Northwindtraders.com"
```

To remove multiple address rewrite entries, use the following syntax:

```
Get-AddressRewriteEntry [<search criteria>] | Remove-AddressRewriteEntry [-WhatIf]
```

This example removes all address rewrite entries:

```
Get-AddressRewriteEntry | Remove-AddressRewriteEntry
```

This example simulates the removal of address rewrite entries that contain the text "to contoso.com" in the name. The *WhatIf* switch allows you to preview the result without committing any changes.

```
Get-AddressRewriteEntry "*to contoso.com" | Remove-AddressRewriteEntry -WhatIf
```

If you're satisfied with the result, run the command again without the *WhatIf* switch to remove the address rewrite entries.

```
Get-AddressRewriteEntry "*to contoso.com" | Remove-AddressRewriteEntry
```

For more information, see Remove-AddressRewriteEntry.

How do you know this worked?

To verify that you have successfully removed an address rewrite entry, do the following:

1. Run the command `Get-AddressRewriteEntry`, and verify that the address rewrite entries you removed aren't listed.

2. From a mailbox that was affected by the address rewrite entry, send a test message to an external mailbox. Verify the test message is no longer affected by the removed address rewrite entry.

3. From the external mailbox, reply to the test message. Verify the original mailbox receives the reply and that the message is unaffected by the removed address rewrite entry.

Import address rewrite entries on Edge Transport servers

8/3/2020 • 4 minutes to read • Edit Online

You can bulk-create or import address rewriting information into an Edge Transport server by using a comma-separated value (CSV) file. The following list describes common scenarios that require you to do this:

- You are replacing an address rewriting solution with an Edge Transport server.
- You enter into an agreement with a third-party solution provider that requires you to rewrite their email addresses.
- You acquire another organization, and you need to temporarily rewrite the email addresses in the acquired organization.

You can use a spreadsheet application like Microsoft Excel to create the CSV file. Format the file as described in this topic and save it as a .csv file.

The first row, or *header row*, of the CSV file lists the names of the parameters. Each parameter is separated by a comma. The required and optional parameters are described in the following table.

PARAMETER	REQUIRED OR OPTIONAL	DESCRIPTION
Name	Required	A unique, descriptive name for the address rewrites entry.
InternalAddress	Required	The address you want to change. You can use the following values: • A single email address (chris@contoso.com) • A single domain or subdomain (contoso.com or sales.contoso.com) • A domain and all subdomains (*.contoso.com)
ExternalAddress	Required	The final email address you want. You can use the following values: • A single email address if you specified a single email address for *InternalAddress* • A single domain or subdomain for all other values of *InternalAddress*
ExceptionList	Optional	Available only when you're rewriting email addresses in a domain and all subdomains (*.contoso.com). Specifies one or more subdomains you want to exclude from address rewriting. Enclose the value in double quotation marks, and separate multiple values by commas. For example, `"marketing.contoso.com"` or `"marketing.contoso.com,legal.contoso.com"` .

PARAMETER	REQUIRED OR OPTIONAL	DESCRIPTION
OutboundOnly	Optional	`False` means that addresses are written on inbound and outbound mail. `True` means that addresses are rewritten on outbound mail only, and you need to manually configure the rewritten email address as a proxy address on the affected recipients. The default value is `False`, but you need to set it to `True` if *InternalAddress* contains the wildcard character (*.contoso.com). The *OutboundOnly* parameter value in the CSV file is `True` or `False`, not `$True` or `$False`.

Each row under the header row represents an individual address rewrite entry. The values in each row need to be in the same order as the parameter names in the header row. Each value is separated by a comma.

What do you need to know before you begin?

- Estimated time to complete this task: 15 minutes
- Make sure you understand the ramifications of address rewriting. For example, the rewritten email address need to be unique in your Exchange organization, and you might need to configure proxy addresses on the affected recipients. For more information, see Address rewriting on Edge Transport servers and Address rewriting procedures on Edge Transport servers.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Address Rewriting agent" entry in the Mail flow permissions topic.
- If you have more than one Edge Transport server, we recommend that you use the procedures in this topic to import the address rewrite entries into a single Edge Transport server and then clone the configuration of that Edge Transport server to the other Edge Transport servers in your organization. For more information about how to clone an Edge Transport server, see Using Edge Transport Server Cloned Configuration.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

TIP

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Step 1: Create the CSV file

When you create the CSV file, consider the following items:

- If you specify values for optional parameters in the CSV file, every row must include a value in that column. If you want to create multiple address rewrite entries where some entries have optional parameters and some entries do not, you need to separate those address rewrite entries into different CSV files, and then import each CSV file separately.
- If the CSV file contains non-ASCII characters, be sure to save the CSV file with UTF-8 encoding or other Unicode encoding. Saving the CSV file with UTF-8 encoding or other Unicode encoding might be easier when the system locale of the computer matches the language that's used in the CSV file.

The following example shows how a CSV file can be populated with the optional *ExceptionList* and *OutboundOnly* parameters included:

```
Name,InternalAddress,ExternalAddress,ExceptionList,OutboundOnly
"Wingtip
UK",*.wingtiptoys.co.uk,tailspintoys.com,"legal.wingtiptoys.co.uk,finance.wingtiptoys.co.uk,support.wingtiptoys
.co.uk",True
"Wingtip
USA",*.wingtiptoys.com,tailspintoys.com,"legal.wingtiptoys.com,finance.wingtiptoys.com,support.wingtiptoys.com,
corp.wingtiptoys.com",True
"Wingtip
Canada",*.wingtiptoys.ca,tailspintoys.com,"legal.wingtiptoys.ca,finance.wingtiptoys.ca,support.wingtiptoys.ca",
True
```

Step 2: Import the CSV file

To import the CSV file, use the following syntax:

```
Import-Csv <FileNameAndPath> | ForEach {New-AddressRewriteEntry -Name $_.Name -InternalAddress
$_.InternalAddress -ExternalAddress $_.ExternalAddress -OutboundOnly ([Bool]::Parse($_.OutboundOnly)) -
ExceptionList $_.ExceptionList}
```

This example imports the address rewrite entries from C:\My Documents\ImportAddressRewriteEntries.csv.

```
Import-Csv "C:\My Documents\ImportAddressRewriteEntries.csv" | ForEach {New-AddressRewriteEntry -Name $_.Name -
InternalAddress $_.InternalAddress -ExternalAddress $_.ExternalAddress -OutboundOnly
([Bool]::Parse($_.OutboundOnly)) -ExceptionList $_.ExceptionList}
```

How do you know this step worked?

To verify that you have successfully imported address rewrite entries from a CSV file, use either of the following procedures:

- To see all address rewrite entries, run the following command:

  ```
  Get-AddressRewriteEntry
  ```

- To see details about a specific address rewrite entry, replace *<AddressRewriteIdentity>* with the name of the address rewrite entry, and run the following command:

  ```
  Get-AddressRewriteEntry "<AddressRewriteIdentity>" | Format-List
  ```

Client Access services

8/3/2020 • 3 minutes to read • Edit Online

In Exchange Server, the Client Access services on Mailbox servers provide authentication and proxy services for internal and external client connections. The Client Access services are stateless, so data isn't queued or stored in them. In Exchange Server, the Client Access services are part of the Mailbox server, so you can't configure a standalone Client Access server like you could in previous versions of Exchange. For more information, see Client access protocol architecture.

Client connectivity in Exchange 2016 and Exchange 2019 is similar to Exchange 2013, but different from Exchange 2010:

- Outlook clients use MAPI over HTTP or Outlook Anywhere (RPC over HTTP). In Exchange 2016 and Exchange 2019, MAPI over HTTP is enabled by default.
- Exchange 2016 and Exchange 2019 require fewer namespaces for site-resilient solutions than Exchange 2010. For more information, see Namespace Planning in Exchange 2016.

Client Access services functionality

The Client Access services in Exchange Server function much like a front door, admitting all client connection requests and routing them to the correct mailbox database. The Client Access services provide network security such as Transport Layer Security (TLS) encryption, and manage client connections through redirection and proxying. The Client Access services authenticate client connections and typically proxy the connection request to the Mailbox server that holds the active copy of the user's mailbox. In some cases, the Client Access services might redirect the request to the Client Access services on another Exchange server, either in a different location or on a more recent version of Exchange.

The Client Access services have the following features:

- **Stateless services**: In previous versions of Exchange, many of the Client Access protocols required session affinity. For example, Outlook Web App in Exchange 2010 required that all requests from a particular client be handled by a specific Client Access server within a load balanced array of Client Access servers. In Exchange 2016 and Exchange 2019, the Client Access services are stateless. In other words, because all processing for the mailbox happens in the backend services on the Mailbox server, it doesn't matter which instance of the Client Access service in an array of Client Access services receives each individual client request. This means that session affinity is no longer required at the load balancer level. This allows inbound connections to Client Access services to be balanced by using simple load balancing techniques such as DNS round-robin. It also allows hardware load balancing devices to support significantly more concurrent connections. For more information, see Load Balancing in Exchange 2016.
- **Connection pooling**: The Client Access services handle client authentication and send the **AuthN** data to the backend services on the Mailbox server. The account that's used by the Client Access services to connect to the backend services on Mailbox servers is a privileged account that's a member of the Exchange Servers group. This allows the Client Access services to pool connections to the backend services on Mailbox servers effectively. An array of Client Access services can handle millions of client connections from the Internet, but far fewer connections are used to proxy the requests to the backend services on Mailbox servers than in Exchange 2010. This improves processing efficiency and end-to-end latency.

NOTE

Don't confuse an array of Client Access services with an RPC Client Access Server array that was used for RPC over TCP client connections in Exchange 2010. In Exchange 2016 and Exchange 2019, an array of Client Access services simply indicates a group of load-balanced Client Access services on Exchange 2016 or Exchange 2019 servers.

Management tasks in the Client Access services

- **Digital certificates**: Although Exchange Server uses self-signed certificates to encrypt and authenticate connections between Exchange servers, you need to install and configure certificates to encrypt client connections. For more information, see Digital certificates and encryption in Exchange Server.
- **Kerberos authentication for load-balanced Client Access services**: For more information, see Configure Kerberos authentication for load-balanced Client Access services.

Exchange admin center in Exchange Server

8/3/2020 • 11 minutes to read • Edit Online

The Exchange admin center (EAC) is the web-based management console in Exchange Server that's optimized for on-premises, online, and hybrid Exchange deployments. The EAC was introduced in Exchange Server 2013, and replaces the Exchange Management Console (EMC) and the Exchange Control Panel (ECP), which were the two management interfaces in Exchange Server 2010.

Looking for the Exchange Online version of this topic? See Exchange admin center in Exchange Online.

Looking for the Exchange Online Protection version of this topic? See Exchange admin center in Exchange Online Protection.

Accessing the EAC

The URL of the EAC is controlled by the Internet Information Services (IIS) virtual directory named ECP in the Client Access (frontend) services on the Mailbox server. Yes, the virtual directory is named ECP, not EAC.

- **Internal URL**: By default, this value contains the fully-qualified domain name (FQDN) of the Exchange server in the format `https://<ServerFQDN>/ecp`. For example, `https://mailbox01.contoso.com/ecp`. To access the EAC in a web browser on the Exchange server itself, you can use the value `https://localhost/ecp`.
- **External URL**: By default, this value is unconfigured. Before you can connect to the EAC from the Internet, you need to configure the following settings:
  - The external URL value on the ECP virtual directory. For more information, see Step 4: Configure external URLs in Configure mail flow and client access on Exchange servers.
  - A corresponding record in your public DNS.
  - A TLS certificate that contains or matches the host name entry. Very likely, this will be a subject alternative name (SAN) certificate or a wildcard certificate, because most of the client services are all available under the same website on the Exchange server. For more information, see Certificate requirements for Exchange services.

    After you configure the settings, a common external URL value for the EAC would resemble `https://mail.contoso.com/ecp`.

    Note: External users who connect to Outlook on the web (formerly known as Outlook Web App) also need access to the EAC to access their own **Options** page. You can disable external administrator access to the EAC while still allowing users to access their **Options** page in Outlook on the web. For more information, see Turn off access to the Exchange admin center.

The easiest way to find the internal and external URL values for the EAC (without using **Servers** > **Virtual directories** in the EAC itself) is by using the **Get-EcpVirtualDirectory** cmdlet in the Exchange Management Shell. To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.

These examples show you how to find the internal and external URL values for the EAC virtual directories in your organization:

- To find the values on all Exchange servers in your organization, run the following command:

```
Get-EcpVirtualDirectory | Format-List Server,Name,*Url
```

- To find the values on the server named Mailbox01, run the following command:

```
Get-EcpVirtualDirectory | Format-List Name,*Url
```

- To find the value for the virtual directory named "ecp (Default Web Site)" on the server named Mailbox01, run the following command.

```
Get-EcpVirtualDirectory -Identity "Mailbox01\ecp (Default Web Site)" | Format-List *Url
```

For more information, see Get-EcpVirtualDirectory.

In Exchange 2016, if you're in a coexistence environment with Exchange 2010, the location of your mailbox controls the default behavior for opening the EAC or ECP:

- If your mailbox is located on the Exchange 2010 Mailbox server, you get the Exchange 2010 ECP by default. You can access the EAC by adding the Exchange version to the URL (which is 15 for both Exchange 2013 and Exchange 2016). For example, to access the EAC through the Client Access (frontend) services on the Mailbox server named Mailbox01, use the following URL: `https://Mailbox01/ecp/?ExchClientVer=15` .
- If your mailbox is located on an Exchange 2016 Mailbox server, and you want to access the ECP on the Exchange 2010 Client Access server named CAS01, use the following URL: `https://CAS01/ecp/?ExchClientVer=14` .

Common user interface elements in the EAC

The section describes the user interface elements that are common across the EAC.

1: Cross-premises navigation

The cross-premises navigation allows you to easily switch between your Exchange Online and on-premises Exchange deployments. If you don't have an Exchange Online organization, the **Office 365** link takes you to a page that compares plans and pricing for Microsoft 365 and Office 365 services.

2: Feature pane

The feature pane is the first level of navigation for most of the tasks that you'll perform in the EAC, and is organized by the following feature areas:

- **Recipients**: Manage mailboxes, groups, resource mailboxes (room and equipment mailboxes), contacts, shared mailboxes, and mailbox migrations and moves. For more information, see the following topics:
  - Create user mailboxes in Exchange Server and Manage user mailboxes
  - Manage distribution groups and Manage dynamic distribution groups
  - Create and manage room mailboxes
  - Manage mail contacts and Manage mail users
  - Create shared mailboxes in the Exchange admin center
- **Permissions**: Manage role-based access control (RBAC) administrator roles, user roles, and Outlook on the web policies. For more information, see the following topics.
  - Manage role groups , Manage role group members, and Manage role assignment policies.
  - View or configure Outlook on the web mailbox policy properties
- **Compliance management**: This is where you'll manage In-Place eDiscovery, In-Place Hold, auditing (mailbox audit logging and administrator audit logging), data loss prevention (DLP), retention policies, retention tags, and journal rules. For more information, see the following topics:
  - In-Place eDiscovery in Exchange Server and In-Place Hold and Litigation Hold in Exchange Server
  - Mailbox audit logging in Exchange Server and Administrator audit logging in Exchange Server
  - Data loss prevention in Exchange Server
  - Retention policies and Retention tags.
  - Journaling in Exchange Server
- **Organization**: Manage federated sharing, Outlook Apps, and address lists. For more information, see the following topics:
  - Sharing
  - Install or remove add-ins for Outlook for your Exchange 2013 organization
  - Address lists in Exchange Server
- **Protection**: Manage antimalware protection for your organization. For more information, see Antimalware protection in Exchange Server.
- **Mail flow**: Manage mail flow rules (also known as transport rules), delivery reports, accepted domains, remote domains, email address policies, Receive connectors, and Send connectors. For more information, see the following topics:
  - Mail flow rules in Exchange Server
  - Track messages with delivery reports
  - Address lists in Exchange Server
  - Accepted domains in Exchange Server

    - Remote Domains
    - Email address policies in Exchange Server
    - Receive connectors
    - Send connectors

- **Mobile**: Manage the mobile devices that you allow to connect to your organization. You can manage mobile device access and mobile device mailbox policies. For more information, see the following topics:
    - Mobile devices
    - Mobile device mailbox policies

- **Public folders**: Manage public folders and public folder mailboxes. For more information, see Public folders.

- **Unified Messaging**: Manage UM dial plans and UM IP gateways. (UM is not available in Exchange 2019.) For more information, see the following topics:
    - UM Dial Plans
    - UM IP Gateways

- **Servers**: View and manage server-specific settings, databases, database availability groups (DAGs), virtual directories, and certificates. For more information, see the following topics:
    - POP3 and IMAP4 in Exchange Server
    - Configure the Startup Mode on a Client Access Server and Configure the Startup Mode on a Mailbox Server
    - Message retry, resubmit, and expiration intervals
    - Configure message tracking , Configure connectivity logging in Exchange Server, and Protocol logging
    - Manage Outlook Anywhere
    - Manage mailbox database copies
    - Manage database availability groups
    - Virtual Directory Management
    - Certificate procedures in Exchange Server

- **Hybrid**: Set up and configure a Hybrid organization.

3: Tabs

The **Setup** tab allows you to run the Hybrid Configuration Wizard or modify the settings of your existing hybrid deployment.

4: Toolbar

When you click most tabs, you'll see a toolbar. The toolbar has icons that perform specific actions. The following table describes the most common icons and their actions. To see the action that's associated with an icon (the icon's title), simply hover over the icon.

ICON	NAME	ACTION
+	Add, New	Create a new object. Some of these icons have an associated down arrow you can click to show additional objects you can create. For example, in **Recipients** > **Mailboxes**, clicking the down arrow displays **User mailbox** and **Linked mailbox** as additional options.
✏	Edit	Edit an object.
🗑	Delete	Delete an object. Some delete icons have a down arrow you can click to show additional options.
🔍	Search	Open a search box so you can enter text for an object that you want to find you want to find in a long list of objects.
🔄	Refresh	Refresh the list view.
•••	More options	View more actions you can perform for that tab's objects. For example, in **Recipients** > **Mailboxes** clicking this icon shows the following options: **Disable**, **Add/Remove columns**, **Export data to a CSV file**, **Connect a mailbox**, and **Advanced search**.
↑ ↓	Up arrow and down arrow	Move an object up or down in the list, when the order is important. For example, in **Mail flow** > **Email address policies** click the up arrow to move the policy higher in the list, which increases the priority of the policy by specifying which policy is applied first. You can also use these arrows to navigate the public folder hierarchy and to move rules up or down in the list view.
⎘	Copy	Copy an object so you can make changes to it without changing the original object. For example, in **Permissions** > **Admin roles**, select a role from the list view, and then click this icon to create a new role group based on an existing one.

ICON	NAME	ACTION
—	Remove	Remove an item from a list. For example, in the **Public Folder Permissions** dialog box, you can remove users from the list of users allowed to access the public folder by selecting the user and clicking this icon.

5: List view

Tabs that contain many objects display those objects in a list view. The viewable limit in the EAC list view is approximately 20,000 objects. Paging is included so you can skip to the results that you want to see. In the **Recipients** list view, you can also configure page size and export the data to a CSV file.

6: Details pane

When you select an object from the list view, more information about that object is displayed in the details pane. For some object types, the details pane includes quick management tasks. For example, if you navigate to **Recipients** > **Mailboxes** and select a mailbox from the list view, the details pane (among other options) displays an option to enable or disable the archive for that mailbox.

Some object types also allow you to bulk edit multiple objects in the details pane. You can select multiple objects in the list view by selecting an object, holding the Shift key, and selecting an object farther down in the list, or by holding down the CTRL key as you select each object. If bulk edit is available for the object types that you selected, you'll see the available options in the details pane. For example, at **Recipients** > **Mailboxes**, when you select multiple mailboxes of the same type, the title of the details pane changes to **Bulk Edit**, and you can update contact and organization information, custom attributes, mailbox quotas, Outlook on the web settings, and more.

7: Notifications

The EAC includes a notification viewer that displays information about:

- Expiring and expired certificates.
- The status of mailbox moves and migrations (also known as Mailbox Replication Service tasks or

MRS tasks). You can also use the notification viewer to opt-in to receive email notifications about these tasks.

- Exporting mailbox content to .pst files.

To show or hide the notification viewer, click the icon (🔔).

Notifications are alerts that are sent to the arbitration mailbox named `FederatedEmail.4c1f4d8b-8179-4148-93bf-00a95fa1e042`. The EAC checks this mailbox for alerts every 30 seconds. Notifications remain in the arbitration mailbox until they are removed by the component that sent them, or until they expire (they should be removed by the Managed Folder Assistant after 30 days).

You can also use the **Get-Notification** cmdlet in the Exchange Management Shell to view more details about notifications, and the **Set-Notification** cmdlet to request notification emails for future alerts.

8: Me tile and Help

The *Me tile* allows you to sign out of the EAC and sign in as a different user by clicking on the drop-down menu that's next to your account name.

Click the help icon (**?**) to view the help content for the tab that you're currently on. If you click on the drop-down menu that's next to the help icon, you can perform the following additional actions:

- **Disable Help bubble**: The Help bubble displays contextual help for fields when you create or edit objects in the EAC. From here, you can globally turn off or turn on the Help bubble for all fields in the EAC.

- **Performance console**: The Performance console displays many counters that relate to the performance of the EAC.

- **Copyright** and **Privacy**: Click these links to read the copyright and privacy information for Exchange Server.

Supported browsers

The levels of support for operating system and browser combinations that you can use to access the EAC are described in the following tables.

Notes:

- The levels of support for the EAC are:

  - **Supported**: All functionality and features are supported and have been fully tested.

  - **Unsupported**: The browser and operating system combination isn't supported, **or** hasn't been tested. For more information about supported versions of Internet Explorer on Windows, see Internet Explorer Support Announcement.

  - **n/a**: The browser and operating system combination isn't possible. For example, an older browser on a newer operating system, or vice-versa.

- Operating system and browser combinations that aren't listed are unsupported. This includes iOS and Android.

- Third-party plug-ins might cause issues with the EAC for supported browsers.

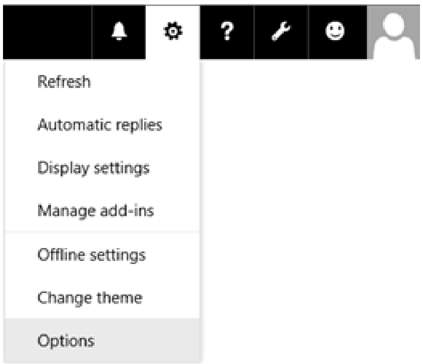
Turn off access to the Exchange admin center

8/3/2020 • 8 minutes to read • Edit Online

The Exchange admin center (EAC) is the primary management interface for Exchange 2013 or later. For more information, see Exchange admin center in Exchange Server. By default, access to the EAC isn't restricted, and access to Outlook on the web (formally known as Outlook Web App) on an on an Internet-facing Exchange server also gives access to the EAC. You still need valid credentials to sign in to the EAC, but organizations may want to restrict access to the EAC for client connections from the Internet.

In Exchange Server 2019, you can use Client Access Rules to block client access to the EAC. For more information, see Client Access Rules in Exchange Server.

The EAC virtual directory is named ECP, and is managed by the *- **ECPVirtualDirectory** cmdlets. When you set the *AdminEnabled* parameter to the value `$false` on the EAC virtual directory, you disable access to the EAC for internal and external client connections, without affecting access to the **Settings** > **Options** page in Outlook on the web.



But, this configuration introduces a new problem: access to the EAC is completely disabled on the server, even for administrators on the internal network. To fix this issue, you have two choices:

- Configure a second Exchange server that's only accessible from the internal network to handle internal EAC connections.
- On the existing Exchange server, create a new Internet Information Services (IIS) web site with new virtual directories for the EAC and Outlook on the web that's only accessible from the internal network.

  Note: You need to configure the EAC **and** Outlook on the web in the new web site, because the EAC requires the Outlook on the web authentication module from the same web site.

What do you need to know before you begin?

- Estimated time to complete each procedure: 5 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Exchange admin center connectivity" entry in the Exchange infrastructure and PowerShell permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

TIP

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Step 1: Use the Exchange Management Shell to disable access to the EAC

Remember, this step disables access to the EAC on the server for internal and external connections, but still allows users to access their own **Settings** > **Options** page in Outlook on the web.

To disable access to the EAC on an Exchange server, use the following syntax:

```
Set-ECPVirtualDirectory -Identity "<Server>\ecp (Default Web Site)" -AdminEnabled $false
```

This example turns disables access to the EAC on the server named MBX01.

```
Set-ECPVirtualDirectory -Identity "MBX01\ecp (Default Web Site)" -AdminEnabled $false
```

How do you know this step worked?

To verify that you've disabled access to the EAC on the server, replace *<Server>* with the name of your Exchange server, and run the following command to verify the value of the **AdminEnabled** property:

```
 -Identity "MBX01\ecp (Default Web Site)" | Format-List AdminEnabled
```

When you open https://<servername>/ecp or from the internal network, your own **Settings** > **Options** page in Outlook on the web opens instead of the EAC.

Step 2: Give access to the EAC on the internal network

Choose either of the following options.

Option 1: Configure a second Exchange server that's only accessible from the internal network

The default value of the **AdminEnabled** property is `True` on the default EAC virtual directory. To confirm this value on the second server, replace *<Server>* with the name of the server, and run the following command:

```
Get-ECPVirtualDirectory -Identity "<Server>\ecp (Default Web Site)" | Format-List AdminEnabled
```

If the value is `False`, replace *<Server>* with the name of the server, and run the following command:

```
Set-ECPVirtualDirectory -Identity "<Server>\ecp (Default Web Site)" -AdminEnabled $true
```

Option 2: Create a new web site on the existing Exchange server, and configure the EAC and Outlook on the web in the new web site for the internal network

The required steps are:

1. Add a second IP address to the Exchange server.

2. Create a new web site in IIS that uses the second IP address, and assign file and folder permissions.

3. Copy the contents of the default web sites to the new web site.

4. Create new EAC and Outlook on the web virtual directories for the new web site.

5. Restart IIS for the changes to take effect.

> **IMPORTANT**
>
> When you install an Exchange Server Cumulative Update (CU), the CU won't update files in the new web site and virtual directories. After you apply the CU, you need to completely remove the new web site, virtual directories, and content in the folders and then re-create the new web site, virtual directories, and content in the folders.

Step 2a: Add a second IP address to the Exchange server

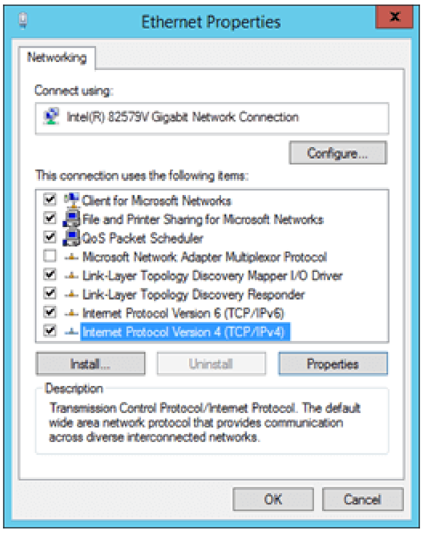
You can add a second network adapter and assign the IP address to the second network adapter, or you can assign a second IP address to the existing network adapter.

The steps to assign a second IP address to the existing network adapter are described below.

1. Open the properties of the network adapter. For example:

   a. From a Command Prompt window, the Exchange Management Shell, or the **Run** dialog, run `ncpa.cpl`.

   b. Right-click on the network adapter, and then choose **Properties**.



Connect using:
Intel(R) 82579V Gigabit Network Connection

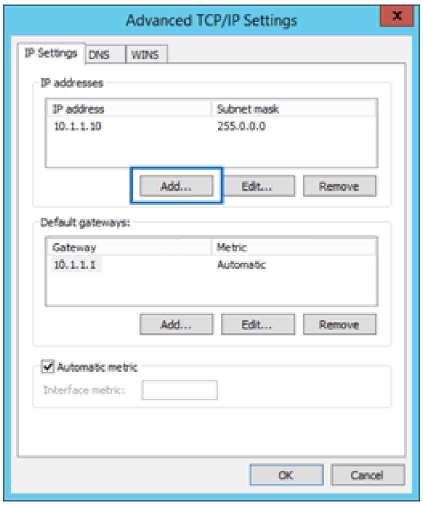
This connection uses the following items:
- ☑ Client for Microsoft Networks
- ☑ File and Printer Sharing for Microsoft Networks
- ☑ QoS Packet Scheduler
- ☐ Microsoft Network Adapter Multiplexor Protocol
- ☑ Link-Layer Topology Discovery Mapper I/O Driver
- ☑ Link-Layer Topology Discovery Responder
- ☑ Internet Protocol Version 6 (TCP/IPv6)
- ☑ Internet Protocol Version 4 (TCP/IPv4)

Description
Transmission Control Protocol/Internet Protocol. The default wide area network protocol that provides communication across diverse interconnected networks.

2. In the properties of the network adapter, select **Internet Protocol Version 4 (TCP/IPv4)**, and then click **Properties**.

3. In the **Internet Protocol Version 4 (TCP/IPv4) Properties** window that opens, on the **General** tab, click **Advanced**.

4. In the **Advanced TCP/IP Settings** window that opens, on the **IP Settings** tab, in the **IP addresses** section, click **Add** and enter the IP address.



IP addresses

IP address	Subnet mask
10.1.1.10	255.0.0.0

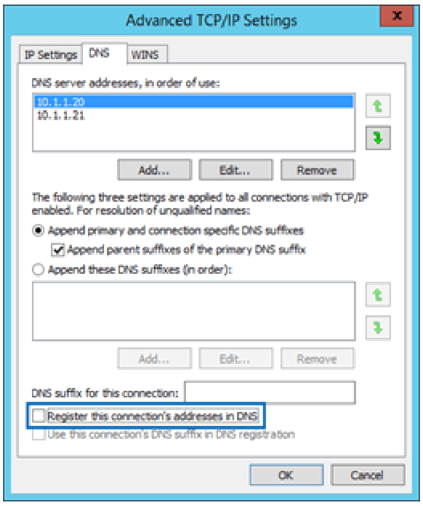
Default gateways:

Gateway	Metric
10.1.1.1	Automatic

☑ Automatic metric

Interface metric:

Note: If you add a second network adapter, in the **Advanced TCP/IP Settings** window, on the **DNS** tab, un-check **Register this connection's address in DNS**.



DNS server addresses, in order of use:

10.1.1.20
10.1.1.21

The following three settings are applied to all connections with TCP/IP enabled. For resolution of unqualified names:

● Append primary and connection specific DNS suffixes

☑ Append parent suffixes of the primary DNS suffix

○ Append these DNS suffixes (in order):

DNS suffix for this connection:

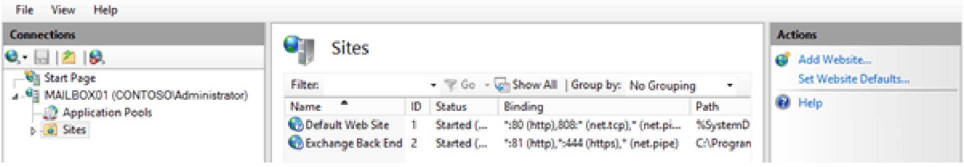
□ Register this connection's addresses in DNS

□ Use this connection's DNS suffix in DNS registration

Step 2b: Create a new web site in IIS that uses the second IP address, and assign file and folder permissions

1. Open IIS Manager on the Exchange server. An easy way to do this in Windows Server 2012 or later is to press Windows key + Q, type inetmgr, and select **Internet Information Services (IIS) Manager** in the results.

2. In the **Connections** pane, expand the server, select **Sites**, and in the **Actions** pane, click **Add Website**.



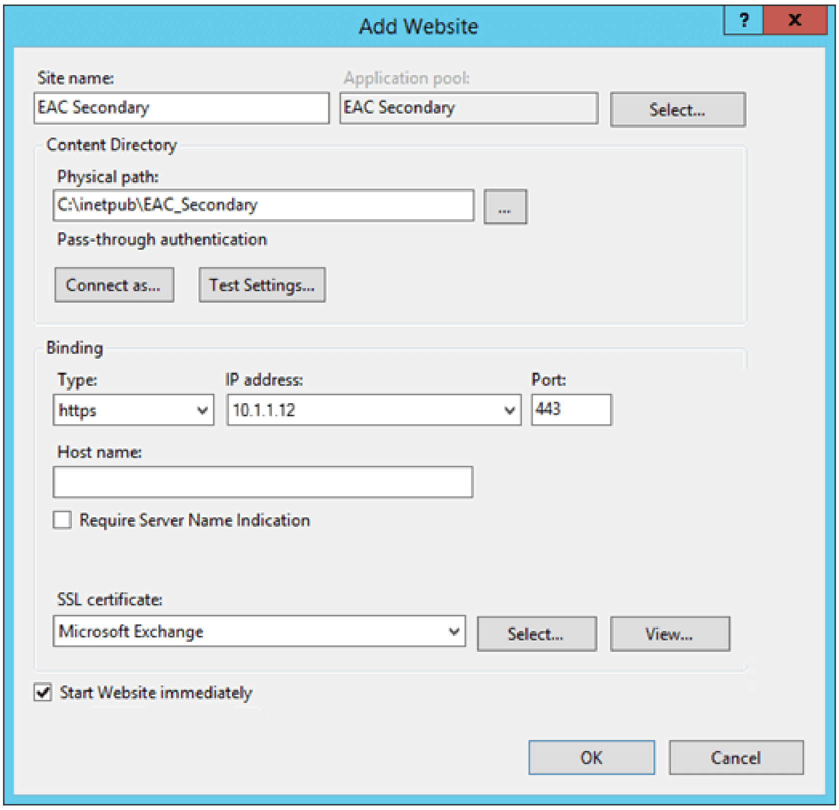
Name	ID	Status	Binding	Path
Default Web Site	1	Started (...	*:80 (http),808:* (net.tcp),* (net.pi...	%SystemD
Exchange Back End	2	Started (...	*:81 (http),*:444 (https),* (net.pipe)	C:\Progran

3. In the **Add Website** window that appears, configure the following settings:

   - **Site name**: `EAC_Secondary`
   - **Physical path**: `C:\inetpub\EAC_Secondary`
   - **Binding**
     - **Type**: https
     - **IP address**: Select the second IP address that you added in the previous step.
     - **Port**: 443
   - **SSL certificate**: Choose the certificate that you want to use (for example, the default Exchange

certificate named Microsoft Exchange).

When you're finished, click **OK**.



Add Website

Site name: EAC Secondary

Application pool: EAC Secondary

Content Directory

Physical path: C:\inetpub\EAC_Secondary

Pass-through authentication

Binding

Type: https

IP address: 10.1.1.12

Port: 443

Host name:

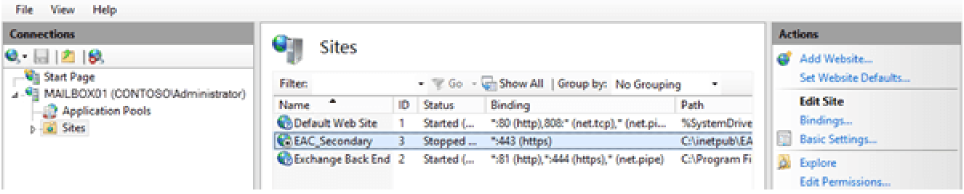
□ Require Server Name Indication

SSL certificate: Microsoft Exchange

☑ Start Website immediately

4. Create `ecp` and `owa` folders in `C:\inetpub\EAC_Secondary`.

a. In IIS Manager, select the `EAC_Secondary` web site, and in the **Actions** pane, click **Explore**.



Sites

Filter: Go Show All | Group by: No Grouping

Name	ID	Status	Binding	Path
Default Web Site	1	Started (...	*:80 (http),808:* (net.tcp),* (net.pi...	%SystemDrive
EAC_Secondary	3	Stopped ...	*:443 (https)	C:\inetpub\EA
Exchange Back End	2	Started (...	*:81 (http),*:444 (https),* (net.pipe)	C:\Program Fi

b. In the File Explorer window that opens, create the following folders in `C:\inetpub\EAC_Secondary`:

- `ecp`
- `owa`

When you're finished, close File Explorer.

5. Assign **Read & Execute** permissions to the local security group named **IIS_IUSRS** on the `C:\inetpub\EAC_Secondary` folder.

a. In IIS Manger, select the `EAC_Secondary` web site, and in the **Actions** pane, click **Edit Permissions**.

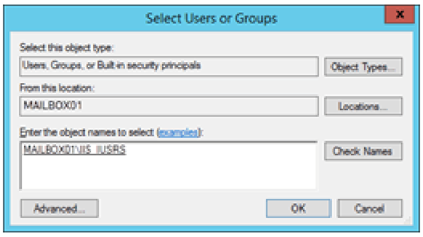
b. In the **EAC_Secondary Properties** window that opens, click the **Security** tab, and then click **Edit**.

c. In the **Permissions for EAC_Secondary** window that opens, click **Add**.

d. In the **Select Users, Computers, Service Accounts or Groups** window that opens, perform the following steps:

i. Click **Locations**, and in the **Locations** dialog box that opens, select the local server, and then click **OK**.

ii. In the **Enter the object names to select** field, type IIS_IUSRS, click **Check Names**, and then click **OK**.



Select Users or Groups

Select this object type:
Users, Groups, or Built-in security principals

From this location:
MAILBOX01

Enter the object names to select (examples):
MAILBOX01\IIS_IUSRS

e. Back on the **Permissions for EAC_Secondary** window, select **IIS_IUSRS**, and in the **Allow** column, select **Read & Execute** (which automatically selects the **List Folder Contents** and **Read** permissions), and then click **OK** twice.

Step 2c: Copy the contents of the default web sites to the new web site

- Copy all files and folders from the Default Web Site (`C:\inetpub\wwwroot`) to `C:\inetpub\EAC_Secondary` . You can skip the following files that can't be copied:
    - `MacCertification.asmx`
    - `MobileDeviceCertification.asmx`
    - `decomission.asmx`
    - `editissuancelicense.asmx`
- Copy all files and folders from `%ExchangeInstallPath%FrontEnd\HttpProxy\ecp` to `C:\inetpub\EAC_Secondary\ecp` .
- Copy all files and folders from `%ExchangeInstallPath%FrontEnd\HttpProxy\owa` to `C:\inetpub\EAC_Secondary\owa` .

Step 2d: Use the Exchange Management Shell to create new EAC and Outlook on the web virtual directories for the new web site

To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.

Replace *<Server>* with the name of your server, and run the following commands to create the new EAC and Outlook on the web virtual directories for the new web site.

```
New-EcpVirtualDirectory -Server <Server> -Role ClientAccess -WebSiteName EAC_Secondary -Path
"C:\inetpub\EAC_Secondary\ecp"
```

```
New-OwaVirtualDirectory -Server <Server> -Role ClientAccess -WebSiteName EAC_Secondary -Path
"C:\inetpub\EAC_Secondary\owa"
```

Step 2e: Restart IIS

1. In IIS Manager, in the **Connections** pane, select the server.

2. In the **Actions** pane, click **Restart**.

Note: To restart IIS from the command line, open an elevated command prompt (a Command Prompt window that you opened by selecting **Run as administrator**) and run the following commands:

```
net stop w3svc /y
```

```
net start w3svc
```

How do you know this task worked?

To verify that you have successfully disabled access to the EAC on an Exchange server, perform the following steps:

1. Test your organization's internal and external URL for Outlook on the web. For example, if the external URL is https://mail.contoso.com/owa, and the internal URL is https://mbx01.contoso.com/owa use the following procedures to verify your configuration:

    - Verify that internal and external users can open their mailboxes by using Outlook on the web, including the **Settings** > **Options** page.

    - Verify that https://mail.contoso.com/ecp and https://mbx01.contoso.com/ecp return either of the following results:

        - **404 - website not found**

        - The user is redirected to their **Settings** > **Options** page in Outlook on the web.

2. Verify that administrators can access the EAC on the internal network based on your configuration selection:

    - **Second Exchange server**: If the second Exchange server is named MBX02, verify that https://mbx02.contoso.com/ecp opens the EAC.

    - **New EAC web site on the existing Exchange server**: If the IP address of the new EAC web site is 10.1.1.12, verify that https://10.1.1.12/ecp opens the EAC.

Autodiscover service in Exchange Server

8/3/2020 • 11 minutes to read • Edit Online

The Autodiscover service minimizes user configuration and deployment steps by providing clients access to Exchange features. For Exchange Web Services (EWS) clients, Autodiscover is typically used to find the EWS endpoint URL. However, Autodiscover can also provide information to configure clients that use other protocols. Autodiscover works for client applications that are inside or outside firewalls and in resource forest and multiple forest scenarios.

Exchange 2016 introduced changes to services that were previously handled by the multiple servers. The Mailbox server now provides Client Access services, so you can't configure a standalone Client Access server like you could in previous versions of Exchange. Autodiscover service in Exchange 2016 and Exchange 2019 is possible because:

- Exchange creates a virtual directory named `autodiscover` under the default web site in Internet Information Services (IIS).
- Active Directory stores and provides authoritative URLs for domain-joined computers.
- Client Access services on Mailbox servers provide authentication and proxy services for internal and external client connections.
- Outlook configures services with only the username and password.

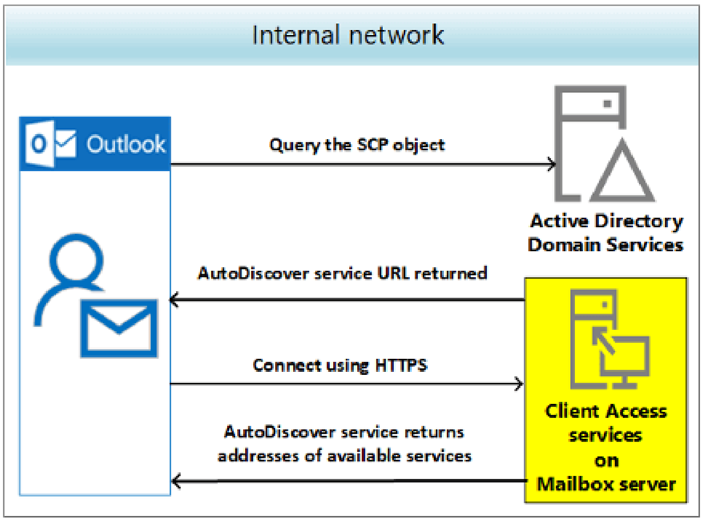
NOTE

If you are a user looking for help with connecting your Outlook client to your Exchange server, see Outlook email setup.

Autodiscover services and Active Directory

Exchange stores in Active Directory the configuration of Exchange servers in the organization as well as information about your users' mailboxes. Before you install Exchange Server, you need to prepare your Active Directory forest and its domains. If you aren't familiar with Exchange forests or domains, see Step 3: Prepare Active Directory domains.

Exchange automatically creates at installation the virtual directory `autodiscover` in IIS, the frontend Client Access services web site that clients connect to. This allows Outlook to discover the Exchange mailbox settings so that users don't have to deal with manually configuring advanced settings.



Internal network
Outlook
Query the SCP object
Active Directory Domain Services
AutoDiscover service URL returned
Connect using HTTPS
AutoDiscover service returns addresses of available services
Client Access services on Mailbox server

The SCP object is also created in Active Directory at the same time as the Autodiscover service virtual directory. The SCP stores and provides authoritative URLs of the Autodiscover service for domain-joined computers.

You need to update the SCP object to point to the Exchange server. This is necessary because Exchange servers provide additional Autodiscover information to clients to improve the discovery process. You can use the **Set-ClientAccessService** cmdlet to update the SCP object. For more information, see Set-ClientAccessService.

> **IMPORTANT**
>
> You need to be assigned permissions before you can run the **Set-ClientAccessService** cmdlet. To find the permissions required to run any cmdlet or parameter in your organization, see Find the permissions required to run any Exchange cmdlet.

Autodiscover makes it easy to retrieve the information that you need to connect to mailboxes on Exchange servers. SCP objects locate those Autodiscover servers or endpoints appropriate for the user you're retrieving settings for. And SCP objects in AD DS provide an easy way for domain-joined clients to look up Autodiscover servers.

Exchange publishes two types of SCP objects for the Autodiscover service:

- **SCP pointers**: Contains information that points to specific LDAP servers that should be used to locate Autodiscover SCP objects for the user's domain. SCP pointers are stamped with the following GUID: 67661d7F-8FC4-4fa7-BFAC-E1D7794C1F68.

- **SCP URLs**: Contains URLs for Autodiscover endpoints. SCP URLs are stamped with the following GUID: 77378F46-2C66-4aa9-A6A6-3E7A48B19596

The SCP object contains the authoritative list of Autodiscover service URLs for the forest. To learn more about locating Autodiscover service endpoints, see Generate a list of Autodiscover endpoints.

Client connectivity in Exchange 2016 and Exchange 2019 is like Exchange 2013 and differs from Exchange 2010. In Exchange 2016 and 2019, MAPI over HTTP is enabled by default, when previously Outlook clients used Outlook Anywhere (RPC over HTTP). Exchange 2016 and 2019 require fewer name spaces for site-resilient solutions than Exchange 2010, reducing to two from the previously required seven namespaces. To read more about namespace and Exchange Server, see the blog Namespace Planning in Exchange 2016.

Depending on whether you configured the Autodiscover service on a separate site, the Autodiscover service URL will be either of the following values, where `//<SMTP-address-domain>` is the primary SMTP domain address:

- `https://<SMTP-address-domain>/autodiscover/autodiscover.xml`

- `https://autodiscover.<smtp-address-domain>/autodiscover/autodiscover.xml`

For example, if the user's email address is tony@contoso.com, the primary SMTP domain address is contoso.com.

Client applications use the Autodiscover service when the application starts for the first time. For example when an Exchange Web Services (EWS) application starts for the first time, the application configures itself using the Autodiscover service. For a user's computer joined to the contoso.com domain and in the Longview regional Active Directory site, the application generates the list of these Autodiscover service endpoints:

ENDPOINT	GENERATED BY
https://longview.contoso.com/autodiscover/autodiscover.xml	SCP results
https://email.contoso.com/autodiscover/autodiscover.xml	SCP results
https://newark.contoso.com/autodiscover/autodiscover.xml	SCP results

ENDPOINT	GENERATED BY
https://contoso.com/autodiscover/autodiscover.exc	Derived from email address
https://autodiscover.contoso.com/autodiscover/autodiscover	Derived from email address

For more information about SCP objects, see Publishing with Service Connection Points.

Autodiscover in DNS

Exchange introduced namespace requirements for Autodiscover in Exchange 2010 and certificates required several of them. In a server resilience scenario, all of these elements were required:

- Primary datacenter IP namespace
- Secondary datacenter IP namespace
- Primary Outlook Web App failback namespace
- Secondary Outlook Web App failback namespace
- Transport namespace (for SMTP)
- Primary datacenter RPC Client Access namespace
- Secondary datacenter RPC Client Access namespace

Server resiliency scenarios have been improved, reducing the five namespaces to two. This is because Exchange no longer needs the RPC Client Access namespaces and Client Access services proxy requests to the Mailbox server that is hosting the active Mailbox database. A Mailbox server in one Active Directory site can proxy a session to a another Active Directory site's Mailbox server.

What this means is that unique namespaces are no longer required for *each* datacenter. For example, instead of mail.contoso.com and mail2.contoso.com, you only need a single namespace, mail.contoso.com, for the datacenter pair. Additionally, failback namespaces are no longer needed in Database Availability Groups (DAG) activation scenarios.

Autodiscover is simple to set up for your domain because it only requires that you create a CNAME resource record in your external (public) DNS. CNAME records let you hide the implementation details of your network from the clients that connect to it. Used internally in your network, CNAME records allow users to use the simpler URI mail.domain.com instead of host.examplemachinename.domain.com.

A CNAME or canonical name record is the DNS equivalent to a Windows shortcut or an Apple Mac alias. A CNAME record is an alias for an Address (A) record that maps an IP address to the target server. If, for example, your domain is contoso.com, you create a CNAME record for autodiscover.contoso.com. The name in the CNAME record must match a name in a certificate. CNAME records work only for hostnames. CNAMEs work externally, but they don't replace the URL in the browser bar. When the certificate is checked against the URL, you get a failure with a warning, but you can still access the service.

A typical CNAME record looks like this:

- Name: autodiscover
- TTL: 3600
- RR Type: CNAME
- Target: The externally accessible FQDN of the Mailbox server (for example, mail.contoso.com)

In this example, autodiscover.contoso.com resolves to mail.contoso.com. For more information, see Step 4: Configure external URLs in Configure mail flow and client access on Exchange servers.

We recommend that you create an Autodiscover CNAME record for every domain on your account, including domain aliases and accepted domains. You need to create either a CNAME or SRV record where your domain is hosted. Only then you can synchronize your offline address book, show free/busy information and enable the Out of office feature in Outlook.

Service (SRV) resource records let you specify the location of the servers for a specific service, protocol, and DNS domain. For example, if you have two Web servers in your domain, you can create SRV resource records indicating which hosts serve as Web servers. Resolvers can then retrieve all the SRV resource records for the Web servers.

A typical SRV record looks like this:

- Service: _autodiscover
- Protocol: ._tcp
- Port Number: 443
- Host: mail.contoso.com
- Priority: 0
- Weight: 0

In this example, the Outlook server namespace is mail.contoso.com.

Read more about CNAME and SRV records in the Exchange team blog, Namespace planning in Exchange 2016.

Autodiscover services in Outlook

With only the user credentials, the Outlook client can authenticate to Active Directory and search for the Autodiscover SCP objects. After the client obtains and enumerates the instances of the Autodiscover service, the client connects to the Client Access (frontend) services on the first Mailbox server in the enumerated list. The client then collects the profile information in the form of XML data that's needed to connect to the user's mailbox and available Exchange features.

> **NOTE**
>
> Depending on your DNS provider's requirements, you may need to add the fully qualified domain name (FQDN) as your hostname. In that case, if your domain is contoso.com, then your hostname would be autodiscover.contoso.com, not autodiscover.com.

You need to set up a special DNS record for your domain name that points to the server providing Autodiscover services so that Exchange accounts function correctly in Outlook. For external access, or using DNS, the client locates the Autodiscover service on the Internet by using the primary SMTP domain address from the user's email address.

The Autodiscover service uses one of these four methods to configure the email client. The first two work for small, single SMTP namespace organizations. The last two serve multiple-SMTP namespaces.

- Connect to: https://contoso.com/AutoDiscover/AutoDiscover.xml
- Connect to: https://autodiscover.contoso.com/AutoDiscover/AutoDiscover.xml
- Autodiscover redirect URL for redirection: http://autodiscover.contoso.com/autodiscover/autodiscover.xml
- Search for DNS SRV record

Some of the hostnames and URLs can be configured by using the Exchange admin center (EAC) and the Exchange Management Shell, while others require that you use PowerShell. You can learn more about that in Configure mail flow and client access.

Through the Autodiscover service, Outlook finds a new connection point made up of the user's mailbox. That is, Autodiscover uses the identification made up of a GUID, plus @, and the domain portion of the user's primary SMTP address. The Autodiscover service returns the following information to the client:

- User's display name
- Separate connection settings for internal and external connectivity
- Location of the user's mailbox (the Mailbox server that currently holds the active copy of the mailbox)
- URLs for various Outlook features that govern functionality such as free/busy information, Unified Messaging (UM) in Exchange 2016 (but not in Exchange 2019), and the offline address book (OAB)
- Outlook Anywhere server settings

You'll need to make sure that you have configured the correct external URLs for the virtual directories of the following services. The examples in the table that follows show values required for the contoso.com email domain.

SERVICE	EXCHANGE MANAGEMENT SHELL	MODIFIES
Offline Address Book	`Get-OabVirtualDirectory | Set-OabVirtualDirectory -ExternalURL https://mail.companycontoso.com/oab`	OAB virtual directories used in IIS
Exchange Web Sevices	`Get-WebServicesVirtualDirectory | Set-WebServicesVirtualDirectory -ExternalURL https://mail.companycontoso.com/ews/exchange.asmx`	Exchange Web Services virtual directories in IIS
Outlook Anywhere (RPC over HTTP)	`Get-OutlookAnywhere | Set-OutlookAnywhere -ExternalHostname mail.contoso.com -ExternalClientsRequireSsl $true`	Outlook Anywhere virtual directories in IIS

Messaging Application Programming Interface (MAPI) over HTTP (Exchange 2013 SP1 or later)	`Get-MapiVirtualDirectory | Set-MapiVirtualDirectory -ExternalURL https://mail.companycontoso.com/mapi`
	`Set-OrganizationConfig -MapiHttpEnabled $true`
		MAPI virtual directories in IIS

Click the Service name in the preceding table for more information about how to obtain or reconfigure these URLs.

When a user's Exchange information changes, Outlook uses the Autodiscover service to automatically reconfigure the user's profile. For example, if a user's mailbox is moved. or the client can't connect to the user's mailbox or to available Exchange features, Outlook will contact the Autodiscover service and automatically update the user's profile to include the information that's required to connect to the mailbox and Exchange features.

Other clients

Autodiscover service the preferred method to locate all services in Skype for Business Server 2015 . When a connection is successful, the Autodiscover service returns all the Web Services URLs for the user's home pool, including the Mobility Service (known as Mcx by the virtual directory created for the service in IIS), Lync Web App and Web scheduler URLs. However, both the internal Mobility Service URL and the external Mobility Service URL is associated with the external Web Services FQDN. Therefore, regardless of whether a mobile device is internal or external to the network, the device always connects to the Mobility Service externally through reverse proxy. The Autodiscover service also returns references to Internal/UCWA, External/UCWA and UCWA. These entries refer to the Unified Communications Web API (UCWA) web component.

Configure Autodiscover services

Autodiscover works for client applications inside and outside firewalls and in resource forest and multiple forest scenarios. For EWS clients, Autodiscover is typically used to find the EWS endpoint URL, but Autodiscover can also provide information to configure clients that use other protocols.

When you install Exchange Server, a self-signed certificate that's created and signed by the Exchange server is automatically installed on the server. However, you can also create additional self-signed certificates that you can use for other services.

Creating a certificate request is the first step in installing a new certificate on an Exchange server to configure Transport Layer Security (TLS) encryption for one or more Exchange services. You use a certificate request (also known as a certificate signing request or CSR) to obtain a certificate from a certification authority (CA). For more information, see the following topics:

- Digital certificates and encryption in Exchange Server
- Create an Exchange Server certificate request for a certification authority

> **NOTE**
>
> You can confirm your Autodiscover service by using the Microsoft Remote Connectivity Analyzer. When the connectivity is successful, also select and run the Outlook Connectivity test. If that fails, you may need to configure the external URLs in Exchange. The results from the Microsoft Remote Connectivity Analyzer should explain why connectivity failed. Generally, a connectivity failure means that you don't have the correct external URLs configured for the virtual directories of the various Outlook services.

Manage Autodiscover services

In deployments where clients connect to multiple Exchange servers, the Autodiscover SCP object is created for the (frontend) Client Access services on each Mailbox server. The SCP object contains the ServiceBindingInfo attribute with the FQDN of the Exchange server that the client connects to in the form of `https://<ExchangeServer>/autodiscover/autodiscover.xml` (for example, `https://cas01/autodiscover/autodiscover.xml)`.

You can run the Exchange ActiveSync Autodiscover and Outlook Autodiscover tests in the Microsoft Remote Connectivity Analyzer. If the user is using a local wireless network to connect to Exchange Online, the user should run both tests to make sure that the local network allows for connections to the ActiveSync endpoints.

You can get help for planning and deploying Autodiscover services as part of your Exchange deployment in Planning and deployment for Exchange Server.

Load balancing in Exchange Server

8/3/2020 • 12 minutes to read • Edit Online

Load balancing in Exchange 2016 and later build on the Microsoft high availability and network resiliency platform delivered in Exchange 2013. When this is combined with the availability of third-party load balancing solutions (both hardware and software), there are multiple options for implementing load balancing in your Exchange organization.

Exchange architecture changes introduced in Exchange 2013 brought about the Mailbox server and Client Access server roles. Compare this to Exchange 2010, where Client Access, Mailbox, Hub Transport, and Unified Messages ran on separate servers.

Using minimal server roles, Exchange 2016 and 2019 deliver:

- Simplified deployment with the Mailbox server running Client Access services and Edge Transport server roles.
- Mail flow managed in the transport pipeline, which is the collection of services, connections, queues, and components that route messages to the Transport service categoriser on the Mailbox server.
- High availability by deploying load balancers to distribute client traffic.

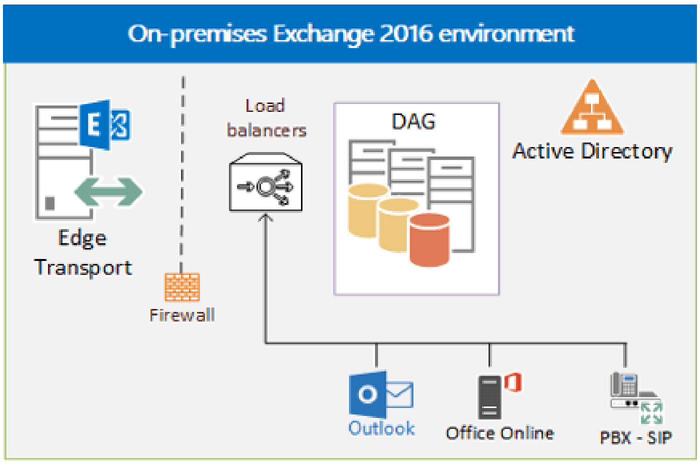
The HTTP protocol standard introduced with Exchange 2013 means that session affinity is no longer required in Exchange 2016 and Exchange 2019. Session affinity allows a persistent connection for messaging-enabled services so that a user doesn't have to reenter their username and password multiple times.

Previously, Exchange 2007 and Exchange 2010 supported RPC over HTTP for Outlook Anywhere. Exchange 2013 introduced MAPI over HTTP, although it wasn't enabled by default. It's now enabled by default in Exchange 2016 and Exchange 2019.

With the HTTP protocol in use, all native clients connect using HTTP and HTTPs in Exchange Server. This standard protocol removes the need for affinity, which was previously required to avoid a new prompting for user credentials whenever load balancing redirected the connection to a different server.

Server roles in Exchange Server

The reduced number of server roles for Exchange 2016 and Exchange 2019 simplifies Exchange implementation and hardware requirements. The number of server roles in Exchange 2016 and 2019 shrinks from seven to two: the Mailbox server and the Edge Transport server. The Mailbox server role includes Client Access services, while the Edge Transport server provides secure mail flow in Exchange 2016 and Exchange 2019, just as it did in earlier versions of Exchange.



In Exchange 2013, the Client Access server role made sure that when a user attempted to access their mailbox, the server proxied the request back to the Mailbox server actively serving the user's mailbox. This meant that services such as Outlook on the web (previously known as Outlook Web App) were rendered for the user on the Mailbox itself, removing any need for affinity.

The same functionality remains in Exchange 2016 and Exchange 2019. If two Mailbox servers host different mailboxes, they can proxy traffic for each other when necessary. The Mailbox server that hosts the active copy of the mailbox serves the user accessing it, even if the user connects to a different Mailbox server.

Read more about the server role changes in Exchange Server in the topic, Exchange Server architecture.

SERVER ROLE	SERVICES
Mailbox server	Uses EdgeSync to manage one-way replication of receipt and configuration info from Active Directory to the AD LDS instance on the Edge Transport server. Copies only information needed to let Edge Transport perform antispam and enable end-to-end mail flow.
Edge Transport	Manages all inbound and outbound Internet mail flow using: • mail relay • smart hosting • agents that provide additional antispam service • agents that apply transport to control mail flow Not a member of the Active Directory forest

Although not required, the Edge Transport server sits in the perimeter network , just as in earlier Exchange versions, to provide secure inbound and outbound mail flow for your Exchange organization.

Read more about the transport service in the topic, Understanding the Transport service on Edge Transport servers.

Protocols in Exchange Server

Beginning with Exchange 2016, all native Exchange clients use the HTTP protocol to connect to a designated service, with HTTP cookies provided to the user at log in which are encrypted using the Client Access services SSL certificate. A logged in user can resume the session on a different Mailbox server running Client Access services without reauthenticating. Servers using the same SSL certificate can decrypt the client authentication cookie.

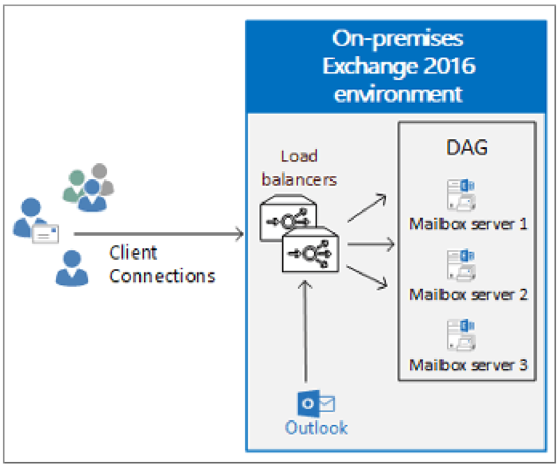
HTTP makes possible the use of service or application health checks in your Exchange network. Depending on your load balancer solution, you can implement health probes to check different components of your system.

The effect of HTTP-only access for clients is that load balancing is simpler, too. If you wanted, you could use DNS to load balance your Exchange traffic. You would simply provide the client with the IP address of every Mailbox server, and the HTTP client would handle the chores. If an Exchange server fails, the protocol attempts to connect to another server. However, there are drawbacks to load balancing to DNS, discussed in the following section *Load balancing options in Exchange Server*.

Read more about HTTP and Exchange Server in the topic MAPI over HTTP in Exchange Server.

Load balancing options in Exchange Server

In the example shown here, multiple servers configured in a database availability group (DAG) host the Mailbox servers running Client Access services. This provides high availability with a small Exchange server footprint. The client connects to the load balancer rather than directly to the Exchange servers. There is no requirement for load balancer pairs, however we recommend deploying in clusters to improve network resilience.



Be aware that DAGs use Microsoft Clustering Services. These services can't be enabled on the same server as Windows Network Load Balancing (NLB). Accordingly, Windows NLB is not an option when using DAGs. There are third-party software and virtual appliance solutions in this case.

Using DNS is the simplest option for load balancing your Exchange traffic . With DNS load balancing, you only have to provide your clients with the IP address of every Mailbox server. After that, DNS round robin distributes that traffic to your Mailbox servers. The HTTP client is smart enough to connect to another server should one Exchange server fail completely.

Simplicity comes at a price, however. In this case, DNS round robin isn't truly load-balancing the traffic, because there isn't a way programmatically to make sure that each server gets a fair share of the traffic. Also, there is no service level monitoring so that when a single service fails, clients are not automatically redirected to an available service. For example, if Outlook on the web is in failure mode, the clients see an error page.

DNS load balancing requires more external IP addresses when you publish externally. That means that each individual Exchange server in your organization would require an external IP address.

There are more elegant solutions to load balancing your traffic, such as hardware that uses Transport Layer 4 or Application Layer 7 to help distribute client traffic. Load balancers monitor each Exchange client-facing service, and in the event of service failure, load balancers can direct traffic to another server and take the problem server offline. Additionally, some level of load distribution makes sure that no single Mailbox server is proxying the majority of client access.

Load balancing services can use Layer 4 or Layer 7, or a combination, to manage traffic. There are benefits and drawbacks to each solution.

- Layer 4 load balancers work at the Transport layer to direct traffic without examining the contents.

  Because they don't examine the traffic contents, Layer 4 load balancers save time in transit. However, this comes with trade-offs. Layer 4 load balancers know only the IP address, protocol, and TCP port. Knowing only a single IP address, the load balancer can monitor only a single service.

  Layer 4 load balancing benefits include:

  - Requires fewer resources (no content examination).
  - Distributes traffic at the Transport layer.

    The risk with a Layer 4 solution is that if a service fails but the server is still available, clients can connect to the failed service. This means that a resilient Layer 4 implementation requires multiple IP addresses configured with separate HTTP namespaces per service, for example, owa.contoso.com, eas.contoso.com, mapi.contoso.com, which allows for service-level monitoring.

- Layer 7 load balancers work at the Application layer and can inspect the traffic content and direct it accordingly.

  Layer 7 load balancers forego the raw performance benefits of Layer 4 load balancing for the simplicity of a single namespace, for example, mail.contoso.com, and per-service monitoring. Layer 7 load balancers understand the HTTP path, such as /owa or /Microsoft-Server-ActiveSync, or /mapi, and can direct traffic to working servers based on monitoring data.

  Layer 7 load balancing benefits include:

  - Needs only a single IP address.
  - Inspects content and can direct traffic.
  - Provides notification of failed service that can be taken offline.
  - Handles load balancer SSL termination.
  - Distributes traffic at the application layer and understands the destination URL.

SSL should terminate at the load balancer as this offers a centralized place to correct SSL attacks.

The ports that need to be load balanced include some, such as those for IMAP4 or POP3, that may not even be used in your Exchange organization.

TCP PORT	ROLES	USES
25	Mailbox	Inbound SMTP
587	Mailbox	Inbound SMTP for clients
110	Mailbox	POP3 clients
143	Mailbox	IMAP4 clients
443	Mailbox	HTTPS (Outlook on the web, AutoDiscover, web services, ActiveSync, MAPI over HTTP, RPC over HTTP, OAB, EAC)
993	Mailbox	Secure IMAP4 clients
995	Mailbox	Secure POP3 clients

Load balancing deployment scenarios in Exchange Server

Exchange 2016 introduced significant flexibility for your namespace and load balancing architecture. With many options for deploying load balancing in your Exchange organization, from simple DNS to sophisticated third-party Layer 4 and Layer 7 solution, we recommend that you review them all in light of your organization's needs.

The following scenarios come with benefits and limitations, and understanding each is key to implementing the solution that best fits your Exchange organization:

- **Scenario A** Single namespace, no session affinity: Layer 4 or Layer 7
- **Scenario B** Single namespace, no session affinity: Layer 7
- **Scenario C** Single namespace with session affinity, Layer 7
- **Scenario D** Multiple namespaces and no session affinity, Layer 4

Scenario A Single namespace, no session affinity: Layer 4 or Layer 7

In this Layer 4 scenario, a single namespace, mail.contoso.com, is deployed for the HTTP protocol clients. The load balancer doesn't maintain session affinity. Because this is a layer 4 solution, the load balancer is configured to check the health of only a single virtual directory as it cannot distinguish Outlook on the web requests from RPC requests.

From the perspective of the load balancer in this example, health is per-server and not per-protocol for the designated namespace. Administrators will have to choose which virtual directory they want to target for the health probe; we recommend that you choose a heavily used virtual directory. For example, if the majority of your users utilize Outlook on the web, then choose the Outlook on the web virtual directory in the health probe.

As long as the Outlook on the web health probe response is healthy, the load balancer keeps the destination Mailbox server in the load balancing pool. However, if the Outlook on the web health probe fails for any reason, then the load balancer removes the destination Mailbox server from the load balancing pool for all requests associated with that namespace. This means that if the health probe fails, all client requests for that namespace are directed to another server, regardless of protocol.

Scenario B Single namespace, no session affinity: Layer 7

In this Layer 7 scenario, a single namespace, mail.contoso.com, is deployed for all the HTTP protocol clients. The load balancer doesn't maintain session affinity. Since the load balancer is configured for Layer 7, there is SSL termination and the load balancer knows the destination URL.

We recommend this configuration for Exchange 2016 and Exchange 2019. The load balancer is configured to check the health of the destination Mailbox servers in the load balancing pool, and a health probe is configured on each virtual directory.

For example, as long as the Outlook on the web health probe response is healthy, the load balancer will keep the destination Mailbox server in the Outlook on the web load balancing pool. However, if the Outlook on the web health probe fails for any reason, then the load balancer removes the target Mailbox server from the load balancing pool for Outlook on the web requests. In this example, health is per-protocol, which means that if the health probe fails, only the affected client protocol is directed to another server.

Scenario C Single namespace with session affinity, Layer 7

In this Layer 7 scenario, a single namespace, mail.contoso.com, is deployed for all the HTTP protocol clients. Because the load balancer is configured for Layer 7, there is SSL termination and the load balancer knows the destination URL. The load balancer is also configured to check the health of the target Mailbox servers in the load balancing pool. The health probe is configured on each virtual directory.

However, enabling session affinity decreases capacity and utilization. This is because the more involved affinity options, cookie-based load balancing or Secure Sockets Layer (SSL) session-ID, require more processing and resources. We recommend that you check with your vendor on how session affinity affects your load balancing scalability.

Just as in the previous scenario, as long as the Outlook on the web health probe response is healthy, the load balancer keeps the destination Mailbox server in the Outlook on the web load balancing pool. However, if the Outlook on the web health probe fails for any reason, then the load balancer removes the target Mailbox server from the load balancing pool for Outlook on the web requests. Here, health is per-protocol, which means that if the health probe fails, only the affected client protocol is directed to another server.

Scenario D Multiple namespaces and no session affinity

This last scenario with multiple namespaces and no session affinity offers per-protocol health checks and Layer 4 power. A unique namespace is deployed for each HTTP protocol client. For example, you would configure the HTTP protocol clients as mail.contoso.com, mapi.contoso.com, and eas.contoso.com.

This scenario provides per-protocol health checking while not requiring complex load-balancing logic. The load balancer uses Layer 4 and is not configured to maintain session affinity. The load balancer configuration checks the health of the destination Mailbox servers in the load balancing pool. In this setting, the health probes are configured to target the health of each virtual directory, as each virtual directory has a unique namespace. Because it's configured for Layer 4, the load balancer doesn't know the URL is being accessed, yet the result is as if it does know. Since health is per-protocol, if the health probe fails, only the affected client protocol is directed to another server.

Load balancing and managed availability in Exchange Server

Monitoring the available servers and services is key to high availability networks. Since some load balancing solutions have no knowledge of the target URL or the content of the request, this can introduce complexities for Exchange health probes.

Exchange 2016 and Exchange 2019 include a built-in monitoring solution, known as Managed Availability. Managed availability, also known as Active Monitoring or Local Active Monitoring, is the integration of built-in monitoring and recovery actions with the Exchange high availability platform.

Managed Availability includes an offline responder. When the offline responder is invoked, the affected protocol (or server) is removed from service.

To ensure that load balancers do not route traffic to a Mailbox server that Managed Availability has marked as offline, load balancer health probes must be configured to check `<virtualdirectory>/healthcheck.htm` , for example, https://mail.contoso.com/owa/healthcheck.htm.

Read more about managed availability in Managed availability.

Configure Kerberos authentication for load-balanced Client Access services

8/3/2020 • 13 minutes to read • Edit Online

In order for you to use Kerberos authentication with load-balanced Mailbox servers running Client Access services, you have to complete the configuration steps described in this article.

Create the alternate service account credential in Active Directory Domain Services

All Exchange servers that run Client Access services that share the same namespaces and URLs must use the same *alternate service account credential* or (ASA credential). In general, it's sufficient to have a single account for a forest for each version of Exchange.

> **IMPORTANT**
>
> Exchange 2010 and Exchange 2016 can't share the same ASA credential. If your ASA credential was created for Exchange 2010, you have to create a new one for Exchange 2016.
>
> While CNAME records are supported for shared namespaces, Microsoft recommends using A records. This ensures that the client correctly issues a Kerberos ticket request based on the shared name, and not the server FQDN.

> **NOTE**
>
> Group Managed Service Accounts (gMSA) are not supported in on-premises Exchange Server environments and thus cannot be used in this scenario.

When you set up the ASA credential, keep these guidelines in mind:

- **Account type**: We recommend that you create a computer account instead of a user account. A computer account doesn't allow interactive logon and may have simpler security policies than a user account. If you create a computer account, the password doesn't expire, but we recommend you update the password periodically anyway. You can use local group policy to specify a maximum age for the computer account and scripts to periodically delete computer accounts that do not meet current policies. Your local security policy also determines when you have to change the password. Although we recommend you use a computer account, you can create a user account.

- **Account name**: There are no requirements for the name of the account. You can use any name that conforms to your naming scheme.

- **Account group**: The account you use for the ASA credential doesn't need special security privileges. If you're using a computer account then the account needs only to be a member of the Domain Computers security group. If you're using a user account then the account needs only to be a member of the Domain Users security group.

- **Account password**: The password you provide when you create the account will be used. So when you create the account, you should use a complex password and ensure that the password conforms to your organization's password requirements.

To create the ASA credential as a computer account

1. On a domain-joined computer, run Windows PowerShell or the Exchange Management Shell.

   Use the **Import-Module** cmdlet to import the Active Directory module.

   ```
   Import-Module ActiveDirectory
   ```

2. Use the **New-ADComputer** cmdlet to create a new Active Directory computer account using this cmdlet syntax:

   ```
   New-ADComputer [-Name] <string> [-AccountPassword <SecureString>] [-AllowReversiblePasswordEncryption
   <System.Nullable[boolean]>] [-Description <string>] [-Enabled <System.Nullable[bool]>]
   ```

   Example:

   ```
   New-ADComputer -Name EXCH2016ASA -AccountPassword (Read-Host 'Enter password' -AsSecureString) -
   Description 'Alternate Service Account credentials for Exchange' -Enabled:$True -SamAccountName
   EXCH2016ASA
   ```

   Where *EXCH2016ASA* is the name of the account, the description *Alternate Service Account credentials for Exchange* is whatever you want it to be, and the value for the *SamAccountName* parameter, in this case *EXCH2016ASA*, has to be unique in your directory.

3. Use the **Set-ADComputer** cmdlet to enable the AES 256 encryption cipher support used by Kerberos using this cmdlet syntax:

   ```
   Set-ADComputer [-Name] <string> [-add @{<attributename>="<value>"]
   ```

   Example:

   ```
   Set-ADComputer EXCH2016ASA -add @{"msDS-SupportedEncryptionTypes"="28"}
   ```

   Where *EXCH2016ASA* is the name of the account and the attribute to be modified is *msDS-SupportedEncryptionTypes* with a decimal value of 28, which enables the following ciphers: RC4-HMAC, AES128-CTS-HMAC-SHA1-96, AES256-CTS-HMAC-SHA1-96.

For more information about these cmdlets, see Import-Module and New-ADComputer.

Cross-forest scenarios

If you have a cross-forest or resource-forest deployment, and you have users that are outside the Active Directory forest that contains Exchange, you must configure forest trust relationships between the forests. Also, for each forest in the deployment, you have to set up a routing rule that enables trust between all name suffixes within the forest and across forests. For more information about managing cross-forest trusts, see Configuring Partner Organizations.

Identify the Service Principal Names to associate with the ASA credential

After you create the ASA credential, you have to associate Exchange Service Principal Names (SPNs) with the ASA credential. The list of Exchange SPNs may vary with your configuration, but should include at least the following:

- **http/**: Use this SPN for Outlook Anywhere, MAPI over HTTP, Exchange Web Services, Autodiscover, and Offline Address Book.

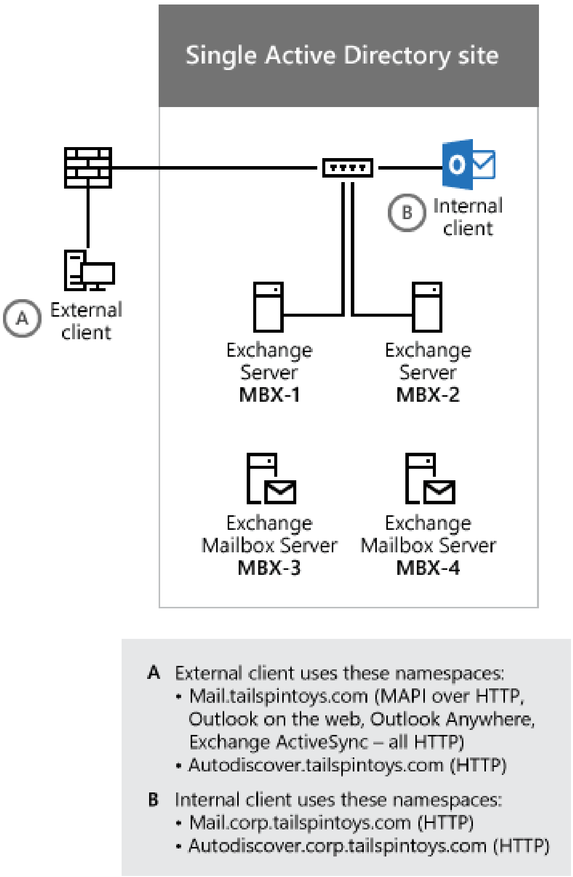
The SPN values must match the service name on the network load balancer instead of on individual servers. To help plan which SPN values you should use, consider the following scenarios:

- Single Active Directory site
- Multiple Active Directory sites

In each of these scenarios, assume that the load-balanced, fully-qualified domain names (FQDNs) have been deployed for the internal URLs, external URLs, and the autodiscover internal URI used by members running Client Access services.

Single Active Directory site

If you have a single Active Directory site, your environment may resemble the one in the following figure:



Single Active Directory site
B Internal client
A External client
Exchange Server MBX-1
Exchange Server MBX-2
Exchange Mailbox Server MBX-3
Exchange Mailbox Server MBX-4

A External client uses these namespaces:
- Mail.tailspintoys.com (MAPI over HTTP, Outlook on the web, Outlook Anywhere, Exchange ActiveSync – all HTTP)
- Autodiscover.tailspintoys.com (HTTP)

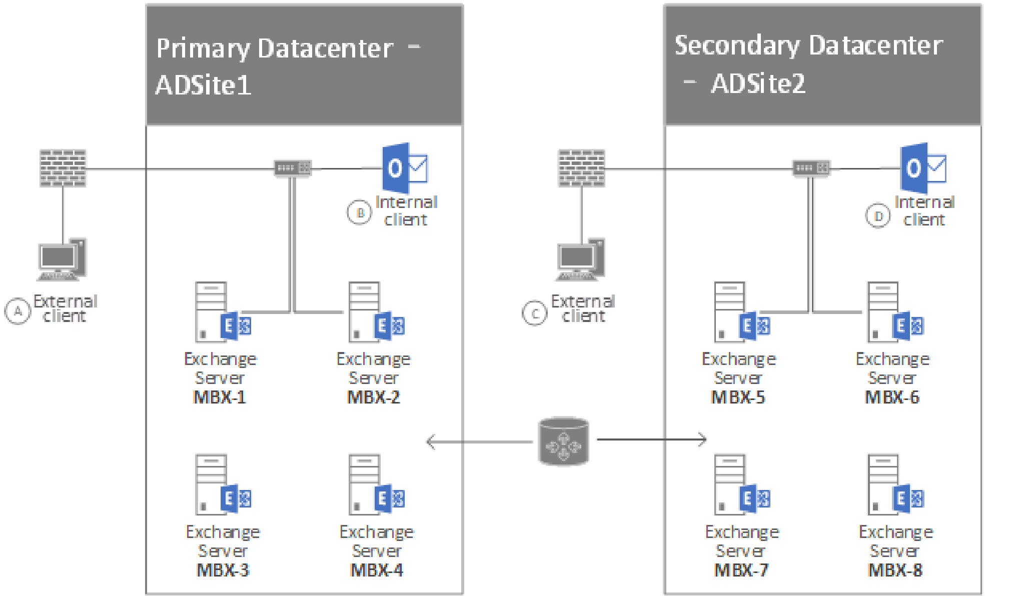
B Internal client uses these namespaces:
- Mail.corp.tailspintoys.com (HTTP)
- Autodiscover.corp.tailspintoys.com (HTTP)

Based on the FQDNs that are used by the internal Outlook clients in the preceding figure, you have to associate the following SPNs with the ASA credential:

- http/mail.corp.tailspintoys.com
- http/autodiscover.corp.tailspintoys.com

Multiple Active Directory sites

If you have multiple Active Directory sites, your environment may resemble the one in the following figure:



A External client uses these namespaces:
- Mail.tailspintoys.com(MAPI over HTTP, Outlook on the web, Outlook Anywhere, Exchange ActiveSync – all HTTP)
- Autodiscover.tailspintoys.com (HTTP)

B Internal client uses these namespaces:
- Mail.corp.tailspintoys.com(HTTP)
- Autodiscover.corp.tailspintoys.com(HTTP)

C External client uses these namespaces:
- Mailsdc.tailspintoys.com(MAPI over HTTP, Outlook on the web, Outlook Anywhere, Exchange ActiveSync – all HTTP)

D Internal client uses these namespaces:
- Mailsdc.corp.tailspintoys.com(HTTP)
- Autodiscoversdc.corp.tailspintoys.com(HTTP)

Based on the FQDNs that are used by the Outlook clients in the preceding figure, you would have to associate the following SPNs with the ASA credential that is used by the Mailbox servers running Client Access services in ADSite 1:

- http/mail.corp.tailspintoys.com
- http/autodiscover.corp.tailspintoys.com

You would also have to associate the following SPNs with the ASA credential that is used by the Mailbox servers running Client Access services in ADSite 2:

- http/mailsdc.corp.tailspintoys.com
- http/autodiscoversdc.corp.tailspintoys.com

Configure and then verify configuration of the ASA credential on each server running Client Access services

After you've created the account, you have to verify that the account has replicated to all AD DS domain controllers. Specifically, the account must be present on each server running Client Access services that will use the ASA credential. Next, you configure the account as the ASA credential on each server running Client Access services in your deployment.

You configure the ASA credential by using the Exchange Management Shell as described in one of these procedures:

- Deploy the ASA credential to the first Exchange server running Client Access services
- Deploy the ASA credential to subsequent Exchange servers running Client Access services

The only supported method for deploying the ASA credential is to use the RollAlternateServiceAcountPassword.ps1 script. For more information, see Using the RollAlternateserviceAccountCredential.ps1 Script in the Shell. After the script has run, we recommend that you verify that all the targeted servers have been updated correctly.

Deploy the ASA Credential to the first Exchange server running Client Access services

1. Open the Exchange Management Shell on an Exchange 2016 or Exchange 2019 server.

2. Change directories to *<Exchange 2016 installation directory>*\V15\Scripts.

3. Run the following command to deploy the ASA credential to the first Exchange 2016 or Exchange 2019 server running Client Access services:

   ```
   .\RollAlternateServiceAccountPassword.ps1 -ToSpecificServer cas-1.corp.tailspintoys.com -
   GenerateNewPasswordFor tailspin\EXCH2016ASA$
   ```

4. When you're asked if you want to change the password for the alternate service account, answer **Yes**.

The following is an example of the output that's shown when you run the RollAlternateServiceAccountPassword.ps1 script.

```

Deploy the ASA credential to another Exchange server running Client Access services

1. Open the Exchange Management Shell on an Exchange 2016 or Exchange 2019 server.

2. Change directories to *<Exchange 2016 installation directory>*\V15\Scripts.

3. Run the following command to deploy the ASA credential to another Exchange 2016 or Exchange 2019 server running Client Access services:

```
.\RollAlternateServiceAccountPassword.ps1 -ToSpecificServer cas-2.corp.tailspintoys.com -CopyFrom cas-1.corp.tailspintoys.com
```

4. Repeat Step 3 for each server running Client Access services that you want to deploy the ASA credential to.

The following is an example of the output that's shown when you run the RollAlternateServiceAccountPassword.ps1 script.

```
========== Starting at 01/12/2016 10:34:35 ==========

Verify the deployment of the ASA credential

- Open the Exchange Management Shell on an Exchange 2016 or Exchange 2019 server.
- Run the following command to check the settings on the server running Client Access services:

```
Get-ClientAccessServer CAS-3 -IncludeAlternateServiceAccountCredentialStatus | Format-List Name, AlternateServiceAccountConfiguration
```

- Repeat Step 2 on each server running Client Access services for which you want to verify the deployment of the ASA credential.

The following is an example of the output that's shown when you run the Get-ClientAccessServer command above and no previous ASA credential was set.

```
Name                                 : CAS-1
AlternateServiceAccountConfiguration : Latest: 1/12/2016 10:19:22 AM, tailspin\EXCH2016ASA$
                                       Previous: <Not set>
                                        ...
```

The following is an example of the output that's shown when you run the Get-ClientAccessServer command above and an ASA credential was previously set. The previous ASA credential and the date and time it was set are returned.

```
Name                                 : CAS-3
AlternateServiceAccountConfiguration : Latest: 1/12/2016 10:19:22 AM, tailspin\EXCH2016ASA$
                                       Previous: 7/15/2015 12:58:35 PM, tailspin\oldSharedServiceAccountName$
                                         ...
```

Associate Service Principal Names (SPNs) with the ASA credential

> **IMPORTANT**
>
> Don't associate SPNs with an ASA credential until you have deployed that credential to at least one Exchange Server, as described earlier in Deploy the ASA Credential to the first Exchange server running Client Access services. Otherwise, you will experience Kerberos authentication errors.

Before you associate the SPNs with the ASA credential, you have to verify that the target SPNs aren't already associated with a different account in the forest. The ASA credential must be the only account in the forest with which these SPNs are associated. You can verify that no other account in the forest is associated with the SPNs by running the **setspn** command from the command line.

Verify an SPN is not already associated with an account in a forest by running the setspn command

1. Press **Start**. In the **Search** box, type **Command Prompt**, then in the list of results, select **Command Prompt**.

2. At the command prompt, type the following command:

   ```
   setspn -F -Q <SPN>
   ```

   Where <SPN> is the SPN you want to associate with the ASA credential. For example:

   ```
   setspn -F -Q http/mail.corp.tailspintoys.com
   ```

   The command should return nothing. If it returns something, another account is already associated with the SPN. Repeat this step one time for each SPN that you want to associate with the ASA credential.

Associate an SPN with an ASA credential by using the setspn command

1. Press **Start**. In the **Search** box, type **Command Prompt**, and then select **Command Prompt** in the list of results.

2. At the command prompt, type the following command:

   ```
   setspn -S <SPN> <Account>$
   ```

   Where <SPN> is the SPN you want to associate with the ASA credential and <Account> is the account associated with the ASA credential. For example:

   ```
   setspn -S http/mail.corp.tailspintoys.com tailspin\EXCH2016ASA$
   ```

   Run this command one time for each SPN that you want to associate with the ASA credential.

Verify you associated the SPNs with the ASA credentials by using the setspn command

1. Press **Start**. In the **Search** box, type **Command Prompt**, and then select **Command Prompt** in the list of results.

2. At the command prompt, type the following command:

   ```
   setspn -L <Account>$
   ```

   Where <Account> is the account associated with the ASA credential. For example:

   ```
   setspn -L tailspin\EXCH2016ASA$
   ```

   You have to run this command only one time.

Enable Kerberos authentication for Outlook clients

1. Open the Exchange Management Shell on an Exchange 2016 or Exchange 2019 server.

2. To enable Kerberos authentication for Outlook Anywhere clients, run the following command on your Exchange 2016 or Exchange 2019 server that is running Client Access services:

   ```
   Get-OutlookAnywhere -Server CAS-1 | Set-OutlookAnywhere -InternalClientAuthenticationMethod  Negotiate
   ```

3. To enable Kerberos authentication for MAPI over HTTP clients, run the following command on your Exchange 2016 or Exchange 2019 server that is running Client Access services:

   ```
   Get-MapiVirtualDirectory -Server CAS-1 | Set-MapiVirtualDirectory -IISAuthenticationMethods
   Ntlm,Negotiate
   ```

   In hybrid environments with Exchange Online or if you use OAuth internally, run the following commands on your Exchange 2016 or Exchange 2019 server that's running Client Access services:

   ```
   $mapidir = Get-MapiVirtualDirectory -Server CAS-1
   $mapidir | Set-MapiVirtualDirectory -IISAuthenticationMethods ($mapidir.IISAuthenticationMethods
   +='Negotiate')
   ```

4. Repeat steps 2 and 3 for each Exchange 2016 or Exchange 2019 server that is running Client Access services for which you want to enable Kerberos authentication.

Verify Exchange client Kerberos authentication

After you've successfully configured Kerberos and the ASA credential, verify that clients can authenticate successfully, as described in these tasks.

Verify that the Microsoft Exchange Service Host service is running

The Microsoft Exchange Service Host service (MSExchangeServiceHost) on the server that is running Client Access services is responsible for managing the ASA credential. If MSExchangeServiceHost isn't running, Kerberos authentication isn't possible. By default, the service is configured to automatically start when the computer starts.

To verify the Microsoft Exchange Service Host service is started

1. Click **Start**, type **services.msc**, and then select **services.msc** from the list.

2. In the **Services** window, locate the **Microsoft Exchange Service Host** service in the list of services.

3. The status of the service should be **Running**. If the status is not **Running**, right-click the service, and then click **Start**.

Verify Kerberos from the server running Client Access services

When you configured the ASA credential on each server running Client Access services, you ran the **Set-**

ClientAccessServer cmdlet. After you run this cmdlet, you can use the logs to verify successful Kerberos connections.

Verify that Kerberos is working correctly by using the HttpProxy log file

1. In a text editor, browse to the folder where the HttpProxy log is stored. By default, the log is stored in the following folder:

   %ExchangeInstallPath%\Logging\HttpProxy\RpcHttp

2. Open the most recent log file, and then look for the word **Negotiate**. The line in the log file will look something like the following example:

   ```
   2014-02-19T13:30:49.219Z,e19d08f4-e04c-42da-a6be-
   b7484b396db0,15,0,775,22,,RpcHttp,mail.corp.tailspintoys.com,/rpc/rpcproxy.dll,,Negotiate,True,tailspin\
   Wendy,tailspintoys.com,MailboxGuid~ad44b1e0-e44f-4a16-9396-
   3a437f594f88,MSRPC,192.168.1.77,EXCH1,200,200,,RPC_OUT_DATA,Proxy,exch2.tailspintoys.com,15.00.0775.000,
   IntraForest,MailboxGuidWithDomain,,,,76,462,1,,1,1,,0,,0,,0,0,16272.3359,0,0,3,0,23,0,25,0,16280,1,16274
   ,16230,16233,16234,16282,?ad44b1e0-e44f-4a16-9396-3a437f594f88@tailspintoys.com:6001,,BeginRequest=2014-
   02-19T13:30:32.946Z;BeginGetRequestStream=2014-02-19T13:30:32.946Z;OnRequestStreamReady=2014-02-
   19T13:30:32.946Z;BeginGetResponse=2014-02-19T13:30:32.946Z;OnResponseReady=2014-02-
   19T13:30:32.977Z;EndGetResponse=2014-02-19T13:30:32.977Z;,PossibleException=IOException;
   ```

   If you see that the **AuthenticationType** value is **Negotiate**, the server is successfully creating Kerberos authenticated connections.

Maintain the ASA credential

If you have to refresh the password on the ASA credential periodically, use the steps for configuring the ASA credential in this article. Consider setting up a scheduled task to perform regular password maintenance. Be sure to monitor the scheduled task to ensure timely password rollovers and prevent possible authentication outages.

Turn Kerberos authentication off

To configure your servers that are running Client Access services to stop using Kerberos, disassociate or remove the SPNs from the ASA credential. If the SPNs are removed, Kerberos authentication won't be tried by your clients, and clients that are configured to use Negotiate authentication will use NTLM instead. Clients that are configured to use only Kerberos will be unable to connect. After the SPNs are removed, you should also delete the account.

To remove the ASA credential

1. Open the Exchange Management Shell on an Exchange 2016 or Exchange 2019 server, and run the following command:

   ```
   Set-ClientAccessServer CAS-1 -RemoveAlternateServiceAccountCredentials
   ```

2. Although you don't have to do this immediately, you should eventually restart all client computers to clear the Kerberos ticket cache from the computer.

Digital certificates and encryption in Exchange Server

8/3/2020 • 15 minutes to read • Edit Online

Encryption and digital certificates are important considerations in any organization. By default, Exchange Server is configured to use Transport Layer Security (TLS) to encrypt communication between internal Exchange servers, and between Exchange services on the local server. But, Exchange administrators need to consider their encryption requirements for communication with internal and external clients (computers and mobile devices), and external messaging servers.

> **NOTE**
>
> Exchange Server 2019 includes important changes to improve the security of client and server connections. The default configuration for encryption will enable TLS 1.2 only and disable support for older algorithms (namely, DES, 3DES, RC2, RC4 and MD5). It will also configure elliptic curve key exchange algorithms with priority over non-elliptic curve algorithms. In Exchange Server 2016 and later, all cryptography settings are inherited from the configuration specified in the operating system. For additional information, see Exchange Server TLS Guidance.

This topic describes the different types of certificates that are available, the default configuration for certificates in Exchange, and recommendations for additional certificates that you'll need to use with Exchange.

For the procedures that are required for certificates in Exchange Server, see Certificate procedures in Exchange Server.

Digital certificates overview

Digital certificates are electronic files that work like an online password to verify the identity of a user or a computer. They're used to create the encrypted channel that's used for client communications. A certificate is a digital statement that's issued by a certification authority (CA) that vouches for the identity of the certificate holder and enables the parties to communicate in a secure manner by using encryption.

Digital certificates provide the following services:

- **Encryption**: They help protect the data that's exchanged from theft or tampering.
- **Authentication**: They verify that their holders (people, web sites, and even network devices such as routers) are truly who or what they claim to be. Typically, the authentication is one-way, where the source verifies the identity of the target, but mutual TLS authentication is also possible.

Certificates can be issued for several uses. For example: web user authentication, web server authentication, Secure/Multipurpose Internet Mail Extensions (S/MIME), Internet Protocol security (IPsec), and code signing.

A certificate contains a public key and attaches that public key to the identity of a person, computer, or service that holds the corresponding private key. The public and private keys are used by the client and the server to encrypt data before it's transmitted. For Windows users, computers, and services, trust in the CA is established when the root certificate is defined in the trusted root certificate store, and the certificate contains a valid certification path. A certificate is considered valid if it hasn't been revoked (it isn't in the CA's certificate revocation list or CRL), or hasn't expired.

The three primary types of digital certificates are described in the following table.

TYPE	DESCRIPTION	ADVANTAGES	DISADVANTAGES
Self-signed certificate	The certificate is signed by the application that created it.	Cost (free).	The certificate isn't automatically trusted by client computers and mobile devices. The certificate needs to be manually added to the trusted root certificate store on all client computers and devices, but not all mobile devices allow changes to the trusted root certificate store. Not all services work with self-signed certificates. Difficult to establish an infrastructure for certificate lifecycle management. For example, self-signed certificates can't be revoked.
Certificate issued by an internal CA	The certificate is issued by a public key infrastructure (PKI) in your organization. An example is Active Directory Certificate Services (AD CS). For more information, see Active Directory Certificate Services Overview.	Allows organizations to issue their own certificates. Less expensive than certificates from a commercial CA.	Increased complexity to deploy and maintain the PKI. The certificate isn't automatically trusted by client computers and mobile devices. The certificate needs to be manually added to the trusted root certificate store on all client computers and devices, but not all mobile devices allow changes to the trusted root certificate store.
Certificate issued by a commercial CA	The certificate is purchased from a trusted commercial CA.	Simplified certificate deployment, because all clients, devices, and servers automatically trust the certificates.	Cost. You need to plan ahead to minimize the number of certificates that are required.

To prove that a certificate holder is who they claim to be, the certificate must accurately identify the certificate holder to other clients, devices, or servers. The three basic methods to do this are described in the following table.

METHOD	DESCRIPTION	ADVANTAGES	DISADVANTAGES
Certificate subject match	The certificate's **Subject** field contains the common name (CN) of the host. For example, the certificate that's issued to www.contoso.com can be used for the web site https://www.contoso.com.	Compatible with all clients, devices, and services. Compartmentalization. Revoking the certificate for a host doesn't affect other hosts.	Number of certificates required. You can only use the certificate for the specified host. For example, you can't use the www.contoso.com certificate for ftp.contoso.com, even when the services are installed on the same server. Complexity. On a web server, each certificate requires its own IP address binding.

METHOD	DESCRIPTION	ADVANTAGES	DISADVANTAGES
Certificate subject alternative name (SAN) match	In addition to the **Subject** field, the certificate's **Subject Alternative Name** field contains a list of multiple host names. For example: • www.contoso.com • ftp.contoso.com • ftp.eu.fabirkam.net	Convenience. You can use the same certificate for multiple hosts in multiple, separate domains. Most clients, devices, and services support SAN certificates. Auditing and security. You know exactly which hosts are capable of using the SAN certificate.	More planning required. You need to provide the list of hosts when you create the certificate. Lack of compartmentalization. You can't selectively revoke certificates for some of the specified hosts without affecting all of the hosts in the certificate.
Wildcard certificate match	The certificate's **Subject** field contains the common name as the wildcard character (*) plus a single domain or subdomain. For example, *.contoso.com or *.eu.contoso.com. The *.contoso.com wildcard certificate can be used for: • www.contoso.com • ftp.contoso.com • mail.contoso.com	Flexibility. You don't need to provide a list of hosts when you request the certificate, and you can use the certificate on any number of hosts that you may need in the future.	You can't use wildcard certificates with other top-level domains (TLDs). For example, you can't use the *.contoso.com wildcard certificate for *.contoso.net hosts. You can only use wildcard certificates for host names at the level of the wildcard. For example, you can't use the *.contoso.com certificate for www.eu.contoso.com. Or, you can't use the *.eu.contoso.com certificate for www.uk.eu.contoso.com. Older clients, devices, applications, or services might not support wildcard certificates. Wildcards aren't available with Extended Validation (EV) certificates. Careful auditing and control is required. If the wildcard certificate is compromised, it affects every host in the specified domain.

Certificates in Exchange

When you install Exchange 2016 or Exchange 2019 on a server, two self-signed certificates are created and installed by Exchange. A third self-signed certificate is created and installed by Microsoft Windows for the Web Management service in Internet Information Services (IIS). These three certificates are visible in the Exchange admin center (EAC) and the Exchange Management Shell, and are described in the following table:

NAME	COMMENTS

NAME	COMMENTS
Microsoft Exchange	This Exchange self-signed certificate has the following capabilities: • The certificate is automatically trusted by all other Exchange servers in the organization. This includes any Edge Transport servers subscribed to the Exchange organization. • The certificate is automatically enabled for all Exchange services except Unified Messaging, and is used to encrypt internal communication between Exchange servers, Exchange services on the same computer, and client connections that are proxied from the Client Access services to the backend services on Mailbox servers. (**Note**: UM is not available on Exchange 2019.) • The certificate is automatically enabled for inbound connections from external SMTP messaging servers, and outbound connections to external SMTP messaging servers. This default configuration allows Exchange to provide *opportunistic TLS* on all inbound and outbound SMTP connections. Exchange attempts to encrypt the SMTP session with an external messaging server, but if the external server doesn't support TLS encryption, the session is unencrypted. • The certificate doesn't provide encrypted communication with internal or external clients. Clients and servers don't trust the Exchange self-signed certificate, because the certificate isn't defined in their trusted root certification stores.
Microsoft Exchange Server Auth Certificate	This Exchange self-signed certificate is used for server-to-server authentication and integration by using OAuth. For more information, see Plan Exchange Server integration with SharePoint and Skype for Business.
WMSVC	This Windows self-signed certificate is used by the Web Management service in IIS to enable remote management of the web server and its associated web sites and applications. If you remove this certificate, the Web Management service will fail to start if no valid certificate is selected. Having the service in this state can prevent you from installing Exchange updates, or uninstalling Exchange from the server. For instructions on how to correct this issue, see Event ID 1007 - IIS Web Management Service Authentication

The properties of these self-signed certificates are described in the Properties of the default self-signed certificates section.

These are the key issues that you need to consider when it comes to certificates in Exchange:

- You don't need to replace the Microsoft Exchange self-signed certificate to encrypt network traffic between Exchange servers and services in your organization.
- You need additional certificates to encrypt connections to Exchange servers by internal and external clients.
- You need additional certificates to force the encryption of SMTP connections between Exchange servers and external messaging servers.

The following elements of planning and deployment for Exchange Server are important drivers for your certificate requirements:

- **Load balancing**: Do you plan to terminate the encrypted channel at load balancer or reverse proxy server, use Layer 4 or Layer 7 load balancers, and use session affinity or no session affinity? For more information, see Load Balancing in Exchange 2016.

- **Namespace planning**: What versions of Exchange are present, are you using the bound or unbound namespace model, and are you using *split-brain DNS* (configuring different IP addresses for the same host based on internal vs. external access)? For more information, see Namespace Planning in Exchange 2016.

- **Client connectivity**: What services will your clients use (web-based services, POP, IMAP, etc.) and what versions of Exchange are involved? For more information, see the following topics:

  - Client Connectivity in an Exchange 2016 Coexistence Environment with Exchange 2013

  - Client Connectivity in an Exchange 2016 Coexistence Environment with Exchange 2010

  - Client Connectivity in an Exchange 2016 Coexistence Environment with Mixed Exchange Versions

Certificate requirements for Exchange services

The Exchange services that certificates can be assigned to are described in the following table.

SERVICE	DESCRIPTION
IIS (HTTP)	By default, the following services are offered under the default website in the Client Access (frontend) services on a Mailbox server, and are used by clients to connect to Exchange: • Autodiscover • Exchange ActiveSync • Exchange admin center • Exchange Web Services • Offline address book (OAB) distribution • Outlook Anywhere (RPC over HTTP) • Outlook MAPI over HTTP • Outlook on the web • Remote PowerShell* Because you can only associate a single certificate with a website, all the DNS names that clients use to connect to these services need to be included in the certificate. You can accomplish this by using a SAN certificate or a wildcard certificate.
POP or IMAP	The certificates that are used for POP or IMAP can be different from the certificate that's used for IIS. However, to simplify administration, we recommend that you also include the host names that are used for POP or IMAP in your IIS certificate, and use the same certificate for all of these services.

SERVICE	DESCRIPTION
SMTP	SMTP connections from clients or messaging servers are accepted by one or more Receive connectors that are configured in the Front End Transport service on the Exchange server. For more information, see Receive connectors. To require TLS encryption for SMTP connections, you can use a separate certificate for each Receive connector. The certificate must include the DNS name that's used by the SMTP clients or servers to connect to the Receive connector. To simplify certificate management, consider including all DNS names for which you have to support TLS traffic in a single certificate. To require *mutual TLS authentication*, where the SMTP connections between the source and destination servers are both encrypted and authenticated, see Domain Security.
Unified Messaging (UM)	For more information, see Deploying Certificates for UM. **Note**: UM is not available in Exchange 2019.
Hybrid deployment with Microsoft 365 or Office 365	For more information, see Certificate Requirements for Hybrid Deployments.
Secure/Multipurpose Internet Mail Extensions (S/MIME)	For more information, see S/MIME for message signing and encryption.

[*] Kerberos authentication and Kerberos encryption are used for remote PowerShell access, from both the Exchange admin center and the Exchange Management Shell. Therefore, you don't need to configure your certificates for use with remote PowerShell, as long as you connect directly to an Exchange server (not to a load balanced namespace). To use remote PowerShell to connect to an Exchange server from a computer that isn't a member of the domain, or to connect from the Internet, you need to configure your certificates for use with remote PowerShell.

Best practices for Exchange certificates

Although the configuration of your organization's digital certificates will vary based on its specific needs, information about best practices has been included to help you choose the digital certificate configuration that's right for you.

- **Use as few certificates as possible**: Very likely, this means using SAN certificates or wildcard certificates. In terms of interoperability with Exchange, both are functionally equivalent. The decision on whether to use a SAN certificate vs a wildcard certificate is more about the key capabilities or limitations (real or perceived) for each type of certificate as described in the Digital certificates overview.

  For example, if all of your common names will be in the same level of contoso.com, it doesn't matter if you use a SAN certificate or a wildcard certificate. But, if need to use the certificate for autodiscover.contoso.com, autodiscover.fabrikam.com, and autodiscover.northamerica.contoso.com, you need to use a SAN certificate.

- **Use certificates from a commercial CA for client and external server connections**: Although you can configure most clients to trust any certificate or certificate issuer, it's much easier to use a certificate from a commercial CA for client connections to your Exchange servers. No configuration is required on the client to trust a certificate that's issued by a commercial CA. Many commercial CAs offer certificates that are configured specifically for Exchange. You can use the EAC or the Exchange Management Shell to generate certificate requests that work with most commercial CAs.

- **Choose the right commercial CA**: Compare certificate prices and features between CAs. For example:
  - Verify that the CA is trusted by the clients (operating systems, browsers, and mobile devices) that connect to your Exchange servers.
  - Verify that the CA supports the kind of certificate that you need. For example, not all CAs support SAN certificates, the CA might limit the number of common names that you can use in a SAN certificate, or the CA may charge extra based on the number of common names in a SAN certificate.
  - See if the CA offers a grace period during which you can add additional common names to SAN certificates after they're issued without being charged.
  - Verify that the certificate's license allows you to use the certificate on the required number of servers. Some CAs only allow you to use the certificate on one server.
- **Use the Exchange certificate wizard**: A common error when you create certificates is to forget one or more common names that are required for the services that you want to use. The certificate wizard in the Exchange admin center helps you include the correct list of common names in the certificate request. The wizard lets you specify the services that will use the certificate, and includes the common names that you need to have in the certificate for those services. Run the certificate wizard when you've deployed your initial set of Exchange 2016 or Exchange 2019 servers and determined which host names to use for the different services for your deployment.
- **Use as few host names as possible**: Minimizing the number of host names in SAN certificates reduces the complexity that's involved in certificate management. Don't feel obligated to include the host names of individual Exchange servers in SAN certificates if the intended use for the certificate doesn't require it. Typically, you only need to include the DNS names that are presented to the internal clients, external clients, or external servers that use the certificate to connect to Exchange.

  For a simple Exchange Server organization named Contoso, this is a hypothetical example of the minimum host names that would be required:

  - **mail.contoso.com**: This host name covers most connections to Exchange, including Outlook, Outlook on the web, OAB distribution, Exchange Web Services, Exchange admin center, and Exchange ActiveSync.
  - **autodiscover.contoso.com**: This specific host name is required by clients that support Autodiscover, including Outlook, Exchange ActiveSync, and Exchange Web Services clients. For more information, see Autodiscover service.

Properties of the default self-signed certificates

Some of the more interesting properties of the default self-signed certificates that are visible in the Exchange admin center and/or the Exchange Management Shell on an Exchange server are described in the following table.

	MICROSOFT EXCHANGE	MICROSOFT EXCHANGE SERVER AUTH CERTIFICATE	WMSVC
Subject	`CN=<ServerName>` (for example, `CN=Mailbox01`)	`CN=Microsoft Exchange Server Auth Certificate`	`CN=WMSvc-<ServerName>` (for example, `CN=WMSvc-Mailbox01`)

	MICROSOFT EXCHANGE	MICROSOFT EXCHANGE SERVER AUTH CERTIFICATE	WMSVC
Subject Alternative Names (CertificateDomains)	• *<ServerName>* (for example, Mailbox01) • *<ServerFQDN>* (for example, Mailbox01.contoso.com)	none	`WMSvc-<ServerName>` (for example, `WMSvc-Mailbox01`)
Has private key (HasPrivateKey)	**Yes** (True)	**Yes** (True)	**Yes** (True)
PrivateKeyExportable*	False	True	True
EnhancedKeyUsageList*	Server Authentication (1.3.6.1.5.5.7.3.1)	Server Authentication (1.3.6.1.5.5.7.3.1)	Server Authentication (1.3.6.1.5.5.7.3.1)
IISServices*	`IIS://<ServerName>/W3SVC/1, IIS://<ServerName>/W3SVC/2` (for example, `IIS://Mailbox01/W3SVC/1, IIS://Mailbox01/W3SVC/2`)	none	none
IsSelfSigned	True	True	True
Issuer	`CN=<ServerName>` (for example, `CN=Mailbox01`)	`CN=Microsoft Exchange Server Auth Certificate`	`CN=WMSvc-<ServerName>` (for example, `CN=WMSvc-Mailbox01`)
NotBefore	The date/time that Exchange was installed.	The date/time that Exchange was installed.	The date/time that the IIS Web Manager service was installed.
Expires on (NotAfter)	5 years after `NotBefore`.	5 years after `NotBefore`.	10 years after `NotBefore`.
Public key size (PublicKeySize)	2048	2048	2048
RootCAType	Registry	None	Registry
Services	IMAP, POP, IIS, SMTP	SMTP	None

*These properties aren't visible in the standard view in the Exchange Management Shell. To see them, you need to specify the property name (exact name or wildcard match) with the **Format-Table** or **Format-List** cmdlets. For example:

- `Get-ExchangeCertificate -Thumbprint <Thumbprint> | Format-List *`
- `Get-ExchangeCertificate -Thumbprint <Thumbprint> | Format-Table -Auto FriendlyName,*PrivateKey*`

For more information, see Get-ExchangeCertificate.

Further details about the default self-signed certificates that are visible in Windows Certificate Manger are described in the following table.

	MICROSOFT EXCHANGE	MICROSOFT EXCHANGE SERVER AUTH CERTIFICATE	WMSVC
Signature algorithm	sha1RSA	sha1RSA	sha1RSA
Signature hash algorithm	sha1	sha1	sha1
Key usage	Digital Signature, Key Encipherment (a0)	Digital Signature, Key Encipherment (a0)	Digital Signature, Key Encipherment (a0), Data Encipherment (b0 00 00 00)
Basic constraints	• `Subject Type=End Entity` • `Path Length Constraint=None` .	• `Subject Type=End Entity` • `Path Length Constraint=None`	n/a
Thumbprint algorithm	sha1	sha1	sha1

Typically, you don't use Windows Certificate Manger to manage Exchange certificates (use the Exchange admin center or the Exchange Management Shell). Note that the WMSVC certificate isn't an Exchange certificate.

Certificate procedures in Exchange Server

8/3/2020 • 3 minutes to read • Edit Online

Ensuring that certificates are installed and configured correctly is key to delivering a secure messaging infrastructure for the enterprise. In Exchange Server you can manage certificates in the Exchange admin center (EAC), and in the Exchange Management Shell. Certificate management in the EAC has been improved over certificate management in the Exchange Management Console in Exchange Server 2010. Specifically, certificate management in the EAC can help administrators by:

- Minimizing the number of certificates that are required.
- Minimizing the interaction that's required for certificates.
- Allowing the centralized installation and management of certificates on all Exchange servers in the organization.

For more information about certificates in Exchange, see Digital certificates and encryption in Exchange Server.

The tasks that are associated with certificate management in Exchange are described in the following table.

TASK	EAC	EXCHANGE MANAGEMENT SHELL	TOPIC	COMMENTS
Create a new self-signed certificate on an Exchange server.	**Servers** > **Certificates** > select the server > **Add** + > **Create a self-signed certificate**	**New-ExchangeCertificate**	Create a new Exchange Server self-signed certificate	You can create new self-signed certificates and configure the certificates for Exchange services in one step.
Create a new certificate request (also known as a certificate signing request or CSR) for a certification authority (CA).	**Servers** > **Certificates** > select the server > **Add** + > **Create a request for a certificate from a certification authority**	**New-ExchangeCertificate** with the *GenerateRequest* switch.	Create an Exchange Server certificate request for a certification authority	The procedures are the same for an internal CA (for example, Active Directory Certificate Services) or a commercial CA.
Complete a pending certificate request on an Exchange server.	**Servers** > **Certificates** > select the server > select the certificate request > click the **Complete** link in the details pane.	**Import-ExchangeCertificate**	Complete a pending Exchange Server certificate request	After you receive the certificate file or files from the CA, you install them on the Exchange server.

TASK	EAC	EXCHANGE MANAGEMENT SHELL	TOPIC	COMMENTS
Assign a certificate to Exchange services.	**Servers** > **Certificates** > select the server > select the certificate > **Edit** ✏ > **Services** tab.	**Enable-ExchangeCertificate**	Assign certificates to Exchange Server services	The procedures are the same for self-signed certificates, or certificates that were issued by a CA. For certificates issued by a CA, you can only assign the certificates to Exchange services after you complete the pending certificate request (install the certificate on the Exchange server).
Delete an existing certificate or certificate request from an Exchange server.	**Servers** > **Certificates** > select the server > select the certificate > **Delete** 🗑	**Remove-ExchangeCertificate**	n/a	The procedures are the same for self-signed certificates, certificate requests, or certificates issued by a CA.
Renew an existing certificate on an Exchange server.	**Servers** > **Certificates** > select the server > select the certificate > click **Renew** in the details pane.	**Get-ExchangeCertificate** and **New-ExchangeCertificate**	Renew an Exchange Server certificate	For self-signed certificates, you renew the certificate in one step. For certificates that were issued by a CA, you create a request to renew the certificate, and send the request to the CA. The notification viewer in the EAC displays a warning when a certificate on any Exchange server in your organization is about to expire.
Export an existing certificate or certificate request from an Exchange server.	**Servers** > **Certificates** > select the server > select the certificate > **More options** ••• > **Export Exchange Certificate**	**Export-ExchangeCertificate**	Export a certificate from an Exchange server	You can only export valid (unexpired) certificates where the **PrivateKeyExportable** property has the value `True`. You can only export pending certificate requests in the Exchange Management Shell. You can't import an exported pending certificate request.

TASK	EAC	EXCHANGE MANAGEMENT SHELL	TOPIC	COMMENTS
Import (install) a certificate on an Exchange server.	**Servers** > **Certificates** > select the server > **More options** ••• > **Import Exchange Certificate**	**Import-ExchangeCertificate**	Import or install a certificate on an Exchange server	Import a certificate that was exported from another server.
View existing certificates or certificate requests on an Exchange server, or view the details for a specific certificate or certificate request.	**Servers** > **Certificates** > select the server For details on a specific certificate or certificate request, select the item from the list, and then click **Edit** ✏.	**Get-ExchangeCertificate**	n/a	Some certificate properties are visible in the details pane in the EAC when you select the certificate or certificate request from the list. Some certificate properties aren't visible in the standard view in the Exchange Management Shell. To see them, you need to specify the property name (exact name or wildcard match) with the **Format-Table** or **Format-List** cmdlets. For more information, see Get-ExchangeCertificate.

Create an Exchange Server certificate request for a certification authority

8/3/2020 • 8 minutes to read • Edit Online

Creating a certificate request is the first step in installing a new certificate on an Exchange server to configure Transport Layer Security (TLS) encryption for one or more Exchange services. You use a certificate request (also known as a certificate signing request or CSR) to obtain a certificate from a certification authority (CA). The procedures are the same for obtaining certificates from an internal CA (for example, Active Directory Certificate Services), or from a commercial CA. After you create the certificate request, you send the results to the CA, and the CA uses the information to issue the actual certificate, which you install later.

You can create certificate requests in the Exchange admin center (EAC) or in the Exchange Management Shell. The **New Exchange certificate** wizard in the EAC can assist you in selecting the host names that are required in the certificate.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes to complete the new certificate request. However, more time is required before the request results in a certificate. For more information, see Next steps.
- You need to plan carefully to choose the type of certificate that you want, and the host names that are required in the certificate. For more information, see Digital certificates and encryption in Exchange Server.
- Verify the certificate request requirements of the CA. Exchange generates a PKCS #10 request (.req) file that uses Base64 (default) or Distinguished Encoding Rules (DER) encoding, with an RSA public key that's 1024, 2048 (default), or 4096 bits. Note that encoding and public key options are only available in the Exchange Management Shell. For more information, see New-ExchangeCertificate.
- In the EAC, you need to store the certificate request file on a UNC path (`\\<Server>\<Share>\` or `\\<LocalServerName>\c$\`). In the Exchange Management Shell, you can specify a local path.
- To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Client Access services security" entry in the Clients and mobile devices permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the EAC to create a new certificate request

1. Open the EAC and navigate to **Servers** > **Certificates**.
2. In the **Select server** list, select the Exchange server where you want to install the certificate, and then click

Add **+**.

3. The **New Exchange certificate** wizard opens. On the **This wizard will create a new certificate or a certificate request file** page, verify that **Create a request for a certificate from a certification authority** is selected, and then click **Next**.

   Note: To create a new self-signed certificate, see Create a new Exchange Server self-signed certificate.

4. On the **Friendly name for this certificate** page, enter a descriptive name for the certificate, and then click **Next**.

5. On the **Request a wildcard certificate** page, make one of the following choices:

   - **If you want a wildcard certificate**: Select **Request a wildcard certificate**, and enter the wildcard character (*) and the domain in the **Root domain** field. For example, *.contoso.com or *.eu.contoso.com. When you're finished, click **Next**.

   - **If you want a subject alternative name (SAN) certificate**: Make no selections on this page, and click **Next**.

   - **If you want a certificate for a single host**: Make no selections on this page, and click **Next**.

6. In the **Store certificate request on this server** page, click **Browse** and select the Exchange server where you want to store the certificate request (where you want to install the certificate), click **OK**, and then click **Next**.

   Note: Steps 7 and 8 only apply to a request for a SAN certificate, or a certificate for a single host. If you selected **Request a wildcard certificate**, skip to Step 9.

7. The **Specify the domains you want to be included in your certificate** page is basically a worksheet that helps you to determine the internal and external host names that are required in the certificate for the following Exchange services:

   - Outlook on the web

   - Offline address book generation (OAB)

   - Exchange Web Services

   - Exchange ActiveSync

   - Autodiscover

   - POP

   - IMAP

   - Outlook Anywhere

     If you enter a value for each service based on the location (internal or external), the wizard determines the host names that are required in the certificate, and the information is displayed on the next page. To modify a value for a service, click **Edit** (✏) and enter the host name value that you want to use (or delete the value). When you're finished, click **Next**.

     If you've already determined the host name values that you need in the certificate, you don't need to fill out the information on this page. Instead, click **Next** to manually enter the host names on the next page.

8. The **Based on your selections, the following domains will be included in your certificate** page lists the host names that will be included in the certificate request. The host name that's used in the certificate's **Subject** field is bold, which can be hard to see if that host name is selected. You can verify the

host name entries that are required in the certificate based on the selections that you made on the previous page. Or, you can ignore the values from the last page and add, edit, or remove host name values.

- If you want a SAN certificate, the **Subject** field still requires one common name (CN) value. To select the host name for the certificate's **Subject** field, select the value and click **Set as common name** (check mark). The value should now appear bold.
- If you want a certificate for a single host name, select the other values one at a time and click **Remove** (−).

  Notes:

  - You can't delete the bold host name value that will be used for the certificate's **Subject** field. First, you need to select or add a different host name, and then click **Set as common name** (check mark).
  - The changes that you make on this page might be lost if you click the **Back** button.

9. On the **Specify information about your organization** page, enter the following values:

   - **Organization name**
   - **Department name**
   - **City/Locality**
   - **State/Province**
   - **Country/Region name**

     Note: These X.500 values are included in the certificate's **Subject** field. Although a value is required in every field before you can proceed, the CA might not care about certain fields (for example, **Department name**), while other fields are very important (for example, **Country/Region name** and **Organization name**). Check the **Subject** field requirements of your CA.

     When you're finished, click **Next**.

10. On the **Save the certificate request to the following file** page, enter the UNC path and filename for the certificate request. For example, `\\FileServer01\Data\ExchCertRequest.req`. When you're finished, click **Finish**.

The certificate request appears in the list of Exchange certificates with a status value of **Pending**. For next steps, see the Next steps section.

Use the Exchange Management Shell to create a new certificate request

To create a new certificate request for a wildcard certificate, a SAN certificate, or a certificate for a single host, use the following syntax:

```
New-ExchangeCertificate -GenerateRequest -RequestFile <FilePathOrUNCPath>\<FileName>.req [-FriendlyName
<DescriptiveName>] -SubjectName [C=<CountryOrRegion>,S=<StateOrProvince>,L=<LocalityOrCity>,O=
<Organization>,OU=<Department>],CN=<HostNameOrFQDN> [-DomainName <Host1>,<Host2>...] [-BinaryEncoded <$true |
$false>] [-KeySize <1024 | 2048 | 4096>] [-Server <ServerIdentity>]
```

This example creates a certificate request on the local Exchange server for a wildcard certificate with the following properties:

- **SubjectName**: *.contoso.com in the United States, which requires the value `C=US,CN=*.contoso.com`.

- **RequestFile**: `\\FileServer01\Data\Contoso Wildcard Cert.req`
- **FriendlyName**: Contoso.com Wildcard Cert

```
New-ExchangeCertificate -GenerateRequest -RequestFile "\\FileServer01\Data\Contoso Wildcard Cert.req" -
FriendlyName "Contoso.com Wildcard Cert" -SubjectName "C=US,CN=*.contoso.com"
```

This example creates a certificate request on the local Exchange server for a SAN certificate with the following properties:

- **SubjectName**: mail.contoso.com in the United States, which requires the value `C=US,CN=mail.contoso.com`. Note that this CN value is automatically included in the *DomainName* parameter (the **Subject Alternative Name** field).
- Additional **Subject Alternative Name** field values:
  - autodiscover.contoso.com
  - legacy.contoso.com
  - mail.contoso.net
  - autodiscover.contoso.net
  - legacy.contoso.net
- **RequestFile**: `\\FileServer01\Data\Contoso SAN Cert.req`
- **FriendlyName**: Contoso.com SAN Cert
- **DomainName**: Unquoted comma-separated list of domains

```
New-ExchangeCertificate -GenerateRequest -RequestFile "\\FileServer01\Data\Contoso SAN Cert.req" -FriendlyName
"Contoso.com SAN Cert" -SubjectName "C=US,CN=mail.contoso.com" -DomainName
autodiscover.contoso.com,legacy.contoso.com,mail.contoso.net,autodiscover.contoso.net,legacy.contoso.net
```

This example creates a request for a single subject certificate with the following properties:

- **SubjectName**: mail.contoso.com in the United States, which requires the value `C=US,CN=mail.contoso.com`.
- **RequestFile**: `\\FileServer01\Data\Mail.contoso.com Cert.req`
- **FriendlyName**: Mail.contoso.com Cert

```
New-ExchangeCertificate -GenerateRequest -RequestFile "\\FileServer01\Data\Mail.contoso.com Cert.req" -
FriendlyName "Mail.contoso.com Cert" -SubjectName "C=US,CN=mail.contoso.com"
```

Notes:

- The only required part of the X.500 *SubjectName* parameter value (the certificate's **Subject** field) is `CN=<HostNameOrFQDN>`. However, the certificate request should always include the `C=<CountryOrRegion>` value (otherwise, you might not be able to renew the certificate). Check the **Subject** field requirements of your CA.
- The *RequestFile* parameter accepts a local path or a UNC path.
- We didn't use the *BinaryEncoded* switch, so the request is Base64 encoded. The information that's displayed onscreen is also written to the file, and the contents of the file are what we need to send to the CA. If we had used the *BinaryEncoded* switch, the request would have been encoded by DER, and the certificate request

file itself is what we would need to send to the CA.

- We didn't use the *KeySize* parameter, so the certificate request has a 2048 bit RSA public key.
- For more information, see New-ExchangeCertificate.

How do you know this worked?

To verify that you have successfully created a new certificate request, perform either of the following steps:

- In the EAC at **Servers** > **Certificates**, verify the server where you stored the certificate request is selected. The request should be in the list of certificates with the **Status** value **Pending request**.
- In the Exchange Management Shell on the server where you stored the certificate request, run the following command:

  ```
  Get-ExchangeCertificate | where {$_.Status -eq "PendingRequest" -and $_.IsSelfSigned -eq $false} |
  Format-List FriendlyName,Subject,CertificateDomains,Thumbprint
  ```

Next steps

The content of a Base64 encoded certificate request file looks like this:

```
-----BEGIN NEW CERTIFICATE REQUEST-----

-----END NEW CERTIFICATE REQUEST-----
```

You need to send this information to the CA. How you send it depends on the CA, but typically, you send the contents of the file in an email message or in the certificate request form on the CA's web site.

If the CA requires a binary certificate request that's encoded by DER (you used the **New-ExchangeCertificate** cmdlet with the *BinaryEncoded* switch), you typically send the whole certificate request file to the CA.

After you receive the certificate from the CA, you need to complete the pending certificate request. For instructions, see Complete a pending Exchange Server certificate request.

Complete a pending Exchange Server certificate request

8/3/2020 • 5 minutes to read • Edit Online

Completing a pending certificate request (also known as a certificate signing request or CSR) is the next step in configuring Transport Layer Security (TLS) encryption in Exchange Server. After you receive the certificate from the certification authority (CA), you install the certificate on the Exchange server to complete the pending certificate request.

You can complete a pending certificate request in the Exchange admin center (EAC) or in the Exchange Management Shell. The procedures are the same for completing new certificate requests or certificate renewal requests. The procedures are also the same for certificates that were issued by an internal CA (for example, Active Directory Certificate Services), or a commercial CA.

You might receive one or more of the following types of certificate files CA:

- **PKCS #12 certificate files**: These are binary certificate files that have .cer, .crt, .der, .p12, or .pfx filename extensions, and require a password when the file contains the private key or chain of trust. The CA might issue you only one binary certificate file that you need to install (protected by a password), or multiple root or intermediate binary certificate files that you also need to install.

- **PKCS #7 certificate files**: These are text certificate files that have .p7b or .p7c filename extensions. These files contain the text: `-----BEGIN CERTIFICATE-----` and `-----END CERTIFICATE-----` or `-----BEGIN PKCS7-----` and `-----END PKCS7-----`. If the CA includes a chain of certificates file with your binary certificate file, you also need to install the chain of certificates file.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.

- The procedures in this topic require you to have created a new certificate request on the Exchange server, sent the certificate request to the CA, and received the certificate from the CA. For more information, see Create an Exchange Server certificate request for a certification authority.

- In the EAC, you need to retrieve the certificate file from a UNC path (`\\<Server>\<Share>` or `\\<LocalServerName>\c$\`). In the Exchange Management Shell, you can use a local file path.

- If you renew or replace a certificate that was issued by a CA on a subscribed Edge Transport server, you need to remove the old certificate, and then delete and recreate the Edge Subscription. For more information, see Edge Subscription process.

- To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.

- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Client Access services security" entry in the Clients and mobile devices permissions topic.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

TIP

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the EAC to create complete a pending certificate request

1. Open the EAC and navigate to **Servers** > **Certificates**.

2. In the **Select server** list, select the Exchange server that holds the pending certificate request.

3. A pending certificate request has the following properties:

   - In the list of certificates, the value of the **Status** field is **Pending request**.

   - When you select the certificate request from the list, there's a **Complete** link in the details pane.

   Select the pending certificate request that you want to complete, and then click **Complete** in the details pane.

4. On the **Complete pending request** page that opens, in the **File to import from** field, enter the UNC path and filename for the certificate file. For example, `\\FileServer01\Data\ContosoCert.cer`. When you're finished, click **OK**.

The certificate request becomes a certificate in the list of Exchange certificates with a **Status** value of **Valid**. For next steps, see the Next steps section.

Use the Exchange Management Shell to complete a pending certificate request

The syntax that you use to complete a pending certificate request in the Exchange Management Shell depends on the type of certificate file or files that you were issued.

To import a binary certificate file (PKCS #12 files that have .cer, .crt, .der, .p12, or .pfx filename extensions), use the following syntax:

```
Import-ExchangeCertificate -FileName "<FilePathOrUNCPath>\<FileName>" [-Password (ConvertTo-SecureString -
String '<Password> ' -AsPlainText -Force)] [-PrivateKeyExportable <$true | $false>] [-Server <ServerIdentity>]
```

This example imports the binary certificate file `\\FileServer01\Data\Contoso Cert.cer` that's protected by the password P@ssw0rd1 on the local Exchange server.

```
Import-ExchangeCertificate -FileName "\\FileServer01\Data\Contoso Cert.cer" -Password (ConvertTo-SecureString
-String 'P@ssw0rd1' -AsPlainText -Force)
```

To import a chain of certificates file (PKCS #7 text files that have .p7b or .p7c filename extensions), use the following syntax:

```
Import-ExchangeCertificate -FileData ([Byte[]](Get-Content -Encoding Byte -Path "<FilePathOrUNCPath>" -
ReadCount 0))]
```

This example imports the text certificate file `\\FileServer01\Data\Chain of Certificates.p7b` on the local Exchange server.

```
Import-ExchangeCertificate -FileData "Import-ExchangeCertificate -FileData ([Byte[]](Get-Content -Encoding
Byte -Path "\\FileServer01\Data\Chain of Certificates.p7b" -ReadCount 0))]
```

Notes:

- The *FileName* and *FileData* parameters accept local paths if the certificate file is located on the Exchange server where you're running the command, and this is the same server where you want to import the certificate. Otherwise, use a UNC path.
- If you want to be able to export the certificate from the server where you're importing it, you need to use the *PrivateKeyExportable* parameter with the value `$true`.
- For more information, see Import-ExchangeCertificate.

How do you know this worked?

To verify that you have successfully completed the certificate request and installed the certificate on the Exchange server, use either of the following procedures:

- In the EAC at **Servers** > **Certificates**, verify the server where you installed the certificate is selected. In the list of certificates, verify that the certificate has **Status** property value **Valid**.
- In the Exchange Management Shell on the server where you installed the certificate, run the following command and verify that the certificate is listed:

  ```
  Get-ExchangeCertificate | where {$_.Status -eq "Valid" -and $_.IsSelfSigned -eq $false} | Format-List
  FriendlyName,Subject,CertificateDomains,Thumbprint
  ```

Next steps

After you complete the pending certificate request by installing the certificate on the server, you need to assign the certificate to one or more Exchange services before the Exchange server is able to use the certificate for encryption. For more information, see Assign certificates to Exchange services.

Assign certificates to Exchange Server services

8/3/2020 • 4 minutes to read • Edit Online

After you install a certificate on an Exchange server, you need to assign the certificate to one or more Exchange services before the Exchange server is able to use the certificate for encryption. You can assign certificates to services in the Exchange admin center (EAC) or in the Exchange Management Shell. Once you assign a certificate to a service, you can't remove the assignment. If you no longer want to use a certificate for a specific service, you need to assign another certificate to the service, and then remove the certificate that you don't want to use.

The available Exchange services are described in the following table.

SERVICE	USES
IIS	TLS encryption for internal and external client connections that use HTTP. This includes: Autodiscover Exchange ActiveSync Exchange admin center Exchange Web Services Offline address book (OAB) distribution Outlook Anywhere (RPC over HTTP) Outlook MAPI over HTTP Outlook on the web
IMAP	TLS encryption for IMAP4 client connections. Don't assign a wildcard certificate to the IMAP4 service. Instead, use the **Set-ImapSettings** cmdlet to configure the fully qualified domain name (FQDN) that clients use to connect to the IMAP4 service.
POP	TLS encryption for POP3 client connections. Don't assign a wildcard certificate to the POP3 service. Instead, use the **Set-PopSettings** cmdlet to configure the FQDN that clients use to connect to the POP3 service.
SMTP	TLS encryption for external SMTP client and server connections. Mutual TLS authentication between Exchange and other messaging servers. When you assign a certificate to SMTP, you're prompted to replace the default Exchange self-signed certificate that's used to encrypt SMTP communication between internal Exchange servers. Typically, you don't need to replace the default SMTP certificate.
Unified Messaging (UM)	TLS encryption for client connections to the backend UM service on Exchange 2016 Mailbox servers. You can only assign a certificate to the UM service when the UM startup mode property of the service is set to TLS or Dual. If the UM startup mode is set to the default value TCP, you can't assign the certificate to the UM service. (**Note**: UM is not available in Exchange 2019). For more information, see Configure the Startup Mode on a Mailbox Server.

SERVICE	USES
Unified Messaging Call Router (UMCallRouter)	TLS encryption for client connections to the UM Call Router service in the Client Access services on Exchange 2016 Mailbox servers. You can only assign a certificate to the UM Call Router service when the UM startup mode property of the service is set to TLS or Dual. If the UM startup mode is set to the default value TCP, you can't assign the certificate to the UM Call Router service. (**Note**: UM is not available in Exchange 2019). For more information, see Configure the Startup Mode on a Client Access Server.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.

- After you do the procedures in this topic, you might need to restart Internet Information Services (IIS). In some scenarios, Exchange might continue to use the previous certificate for encrypting and decrypting the cookie that's used for Outlook on the web (formerly known as Outlook Web App) authentication. We recommend restarting IIS in environments that use Layer 4 load balancing.

- If you renew or replace a certificate that was issued by a CA on a subscribed Edge Transport server, you need to remove the old certificate, and then delete and recreate the Edge Subscription. For more information, see Edge Subscription process.

- To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.

- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Client Access services security" entry in the Clients and mobile devices permissions topic.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

TIP

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the EAC to assign a certificate to Exchange services

1. Open the EAC, and navigate to **Servers** > **Certificates**.

2. In the **Select server** list, select the Exchange server that holds the certificate.

3. Select the certificate that you want to configure, and then click **Edit** ✎. The certificate needs to have the **Status** value **Valid**.

4. On the **Services** tab, in the **Specify the services you want to assign this certificate to** section, select the services. Remember, you can add services, but you can't remove them. When you're finished, click **Save**.

Use the Exchange Management Shell to assign a certificate to Exchange services

To assign a certificate to Exchange services, use the following syntax:

```
Enable-ExchangeCertificate -Thumbprint <Thumbprint> -Services <Service1>,<Service2>... [-Server
<ServerIdentity>]
```

This example assigns the certificate that has the thumbprint value `434AC224C8459924B26521298CE8834C514856AB` to the POP, IMAP, IIS, and SMTP services.

```
Enable-ExchangeCertificate -Thumbprint 434AC224C8459924B26521298CE8834C514856AB -Services POP,IMAP,IIS,SMTP
```

You can find the certificate thumbprint value by using the **Get-ExchangeCertificate** cmdlet.

How do you know this worked?

To verify that you have successfully assigned a certificate to one or more Exchange services, use either of the following procedures:

- In the EAC at **Servers** > **Certificates**, verify the server where you installed the certificate is selected. Select the certificate, and in the details pane, verify that the **Assigned to services property** contains the services that you selected.
- In the Exchange Management Shell on the server where you installed the certificate, run the following command to verify the Exchange services for the certificate:

  ```
  Get-ExchangeCertificate | Format-List FriendlyName,Subject,CertificateDomains,Thumbprint,Services
  ```

Create a new Exchange Server self-signed certificate

8/3/2020 • 5 minutes to read • Edit Online

When you install Exchange Server, a self-signed certificate that's created and signed by the Exchange server itself is automatically installed on the server. However, you can also create additional self-signed certificates that you can use.

You can create self-signed certificates certificate in the Exchange admin center (EAC) or in the Exchange Management Shell.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- Exchange self-signed certificates work well for encrypting communication between internal Exchange servers, but not so well for encrypting external connections, because clients, servers, and services don't automatically trust Exchange self-signed certificates. To create a certificate request (also known as a certificate signing request or CSR) for a commercial certification authority that's automatically trusted by all clients, servers, and services, see Create an Exchange Server certificate request for a certification authority.
- When you create a new self-signed certificate by using the **New-ExchangeCertificate** cmdlet, you can assign the certificate to Exchange services during the creation of the certificate. For more information about the Exchange services, see Assign certificates to Exchange Server services.
- To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Client Access services security" entry in the Clients and mobile devices permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the EAC to create a new Exchange self-signed certificate

1. Open the EAC and navigate to **Servers** > **Certificates**.
2. In the **Select server** list, select the Exchange server where you want to install the certificate, and then click **Add** ➕.
3. The **New Exchange certificate** wizard opens. On the **This wizard will create a new certificate or a certificate request file** page, select **Create a self-signed certificate**, and then click **Next**.

   Note: To create a new certificate request for a certificate authority, see Create an Exchange Server certificate request for a certification authority.
4. On the **Friendly name for this certificate** page, enter a friendly name for the certificate, and then click

Next.

5. In the **Specify the servers you want to apply this certificate to** page, click **Add** +

   On the **Select a server** page that opens, select the Exchange server where you want to install the certificate, and click **Add - >**. Repeat this step as many times as necessary. When you're finished selecting servers, click **OK**.

   When you're finished, click **Next**.

6. The **Specify the domains you want to be included in your certificate** page is basically a worksheet that helps you determine the internal and external host names that are required in the certificate for the following Exchange services:

   - Outlook on the web
   - Offline address book generation (OAB)
   - Exchange Web Services
   - Exchange ActiveSync
   - Autodiscover
   - POP
   - IMAP
   - Outlook Anywhere

     If you enter a value for each service based on the location (internal or external), the wizard determines the host names that are required in the certificate, and the information is displayed on the next page. To modify a value for a service, click **Edit** (✎) and enter the host name value that you want to use (or delete the value). When you're finished, click **Next**.

     If you've already determined the host name values that you need in the certificate, you don't need to fill out the information on this page. Instead, click **Next** to manually enter the host names on the next page.

7. The **Based on your selections, the following domains will be included in your certificate** page lists the host names that will be included in the self-signed certificate. The host name that's used in the certificate's **Subject** field is bold, which can be hard to see if that host name is selected. You can verify the host name entries that are required in the certificate based on the selections that you made on the previous page. Or, you can ignore the values from the last page and add, edit, or remove host name values.

   - If you want a SAN certificate, the **Subject** field still requires one common name (CN) value. To select the host name for the certificate's **Subject** field, select the value and click **Set as common name** (check mark). The value should now appear bold.
   - If you want a certificate for a single host name, select the other values one at a time and click **Remove** (−).

     When you're finished on this page, click **Finish**.

     Notes:

   - You can't delete the bold host name value that will be used for the certificate's **Subject** field. First, you need to select or add a different host name, and then click **Set as common name** (check mark).
   - The changes that you make on this page might be lost if you click the **Back** button.

Use the Exchange Management Shell to create a new Exchange self-signed certificate

To create a new Exchange self-signed certificate, use the following syntax:

```
New-ExchangeCertificate [-FriendlyName <DescriptiveName>] [-SubjectName [C=<CountryOrRegion>,S=<StateOrProvince>,L=<LocalityOrCity>,O=<Organization>,OU=<Department>],CN=<HostNameOrFQDN>]] [-DomainName <Host1>,<Host2>...] [-Services <None | IIS | IMAP | POP | SMTP | UM | UMCallRouter> [-PrivateKeyExportable <$true | $false>] [-Server <ServerIdentity>] -[Force]
```

This example creates a self-signed certificate on the local Exchange server with the following properties:

- **Subject**: *<ServerName>*. For example, if you run the command on the server named Mailbox01, the value is `Mailbox01`.
- **Subject alternative names**: *<ServerName>*, <Server FQDN>. For example, `Mailbox01, Mailbox01.contoso.com`.
- **Friendly name**: Microsoft Exchange
- **Services**: POP, IMAP, SMTP.

```
New-ExchangeCertificate
```

This example creates a creates a self-signed certificate on the local Exchange server with the following properties:

- **Subject**: Exchange01, which requires the value `CN=Exchange01`. Note that this value is automatically included in the *DomainName* parameter (the **Subject Alternative Name** field).
- Additional subject alternative names:
  - mail.contoso.com
  - autodiscover.contoso.com
  - Exchange01.contoso.com
  - Exchange02.contoso.com
- **Services**: SMTP, IIS
- **Friendly name**: Contoso Exchange Certificate
- The private key is exportable. This allows you to export the certificate from the server (and import it on other servers).

```
New-ExchangeCertificate -FriendlyName "Contoso Exchange Certificate" -SubjectName CN=Exchange01 -DomainName mail.contoso.com,autodiscover.contoso.com,Exchange01.contoso.com,Exchange02.contoso.com -Services SMTP,IIS -PrivateKeyExportable $true
```

Notes:

- The only required part of the X.500 *SubjectName* parameter value (the certificate's **Subject** field) is `CN=<HostNameOrFQDN>`.
- Some *Services* parameter values generate warning or confirmation messages. For more information, see Assign certificates to Exchange Server services.

- For more information, see New-ExchangeCertificate.

How do you know this worked?

To verify that you have successfully created an Exchange self-signed certificate, perform either of the following steps:

- In the EAC at **Servers** > **Certificates**, verify the server where you created the self-signed certificate is selected. The certificate should be in the list of certificates with the **Status** value **Valid**.
- In the Exchange Management Shell on the server where you created the self-signed certificate, run the following command and verify the properties:

```
Get-ExchangeCertificate | where {$_.Status -eq "Valid" -and $_.IsSelfSigned -eq $true} | Format-List
FriendlyName,Subject,CertificateDomains,Thumbprint,NotBefore,NotAfter
```

Renew an Exchange Server certificate

8/3/2020 • 6 minutes to read • Edit Online

Every certificate has a built-in expiration date. In Exchange Server, the default self-signed certificate that's installed on the Exchange server expires 5 years after Exchange was installed on the server. You can use the Exchange admin center (EAC) or the Exchange Management Shell to renew Exchange certificates. This includes Exchange self-signed certificates, and certificates that were issued by a certification authority (CA).

What do you need to know before you begin?

- Estimated time to complete: 5 minutes
- To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.
- For certificates that were issued by a CA, verify the certificate request requirements of the CA. Exchange generates a PKCS #10 request (.req) file that uses Base64 encoding (default) or Distinguished Encoding Rules (DER), with an RSA public key that's 1024, 2048 (default), or 4096 bits. Note that encoding and public key options are only available in the Exchange Management Shell.
- To renew a certificate that was issued by a CA, you need to renew the certificate with the same CA that issued the certificate. If you're changing CAs, or if there's a problem with the original certificate when you try to renew it, you need to create a new certificate request (also known as a certificate signing request or CSR) for a new certificate. For more information, see Create an Exchange Server certificate request for a certification authority.
- If you renew or replace a certificate that was issued by a CA on a subscribed Edge Transport server, you need to remove the old certificate, and then delete and recreate the Edge Subscription. For more information, see Edge Subscription process.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Client Access services security" entry in the Clients and mobile devices permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Renew a certificate that was issued by a certification authority

The procedures are the same for certificates that were issued by an internal CA (for example, Active Directory Certificate Services), or a commercial CA.

To renew a certificate that was issued by a CA, you create a certificate renewal request, and then you send the request to the CA. The CA then sends you the actual certificate file that you need to install on the Exchange server. The procedure is nearly identical to that of completing a new certificate request by installing the certificate on the server. For instructions, see Complete a pending Exchange Server certificate request.

Use the EAC to create a certificate renewal request for a certification authority

1. Open the EAC and navigate to **Servers** > **Certificates**.

2. In the **Select server** list, select the Exchange server that holds the certificate that you want to renew.

3. All valid certificates have a **Renew** link in the details pane that's visible when you select the certificate from the list. Select the certificate that you want to renew, and then click **Renew** in the details pane.

4. On the **Renew Exchange certificate** page that opens, in the **Save the certificate request to the following file** field, enter the UNC path and filename for the new certificate renewal request file. For example, `\\FileServer01\Data\ContosoCertRenewal.req`. When you're finished, click **OK**.

The certificate request appears in the list of Exchange certificates with a status value of **Pending**.

Use the Exchange Management Shell to create a certificate renewal request for a certification authority

To create a certificate renewal request for a certification authority on the local Exchange server, use the following syntax:

```
Get-ExchangeCertificate -Thumbprint <Thumbprint> | New-ExchangeCertificate -GenerateRequest -RequestFile
<FilePathOrUNCPath>\<FileName>.req
```

To find the thumbprint value of the certificate that you want to renew, run the following command:

```
Get-ExchangeCertificate | where {$_.Status -eq "Valid" -and $_.IsSelfSigned -eq $false} | Format-List
FriendlyName,Subject,CertificateDomains,Thumbprint,NotBefore,NotAfter
```

This example creates a certificate renewal request with the following properties:

- **Certificate to renew**: `5DB9879E38E36BCB60B761E29794392B23D1C054`

- **RequestFile**: `\\FileServer01\Data\ContosoCertRenewal.req`

```
Get-ExchangeCertificate -Thumbprint 5DB9879E38E36BCB60B761E29794392B23D1C054 | New-ExchangeCertificate -
GenerateRequest -RequestFile \\FileServer01\Data\ContosoCertRenewal.req
```

Notes:

- The *RequestFile* parameter accepts a local path or a UNC path.

- We didn't use the *BinaryEncoded* switch, so the request is Base64 encoded. The information that's displayed onscreen is also written to the file, and the contents of the file are what we need to send to the CA. If we had used the *BinaryEncoded* switch, the request would have been encoded by DER, and the certificate request file itself is what we would need to send to the CA.

- We didn't use the *KeySize* parameter, so the certificate request has a 2048 bit RSA public key.

- For more information, see Get-ExchangeCertificate and New-ExchangeCertificate.

How do you know this worked?

To verify that you have successfully created a certificate renewal request for a certification authority, perform either of the following steps:

- In the EAC at **Servers** > **Certificates**, verify the server where you stored the certificate request is selected. The request should be in the list of certificates with the **Status** value **Pending request**.

- In the Exchange Management Shell on the server where you stored the certificate request, run the following command:

```
Get-ExchangeCertificate | where {$_.Status -eq "PendingRequest" -and $_.IsSelfSigned -eq $false} |
Format-List FriendlyName,Subject,CertificateDomains,Thumbprint
```

Renew an Exchange self-signed certificate

When you renew an Exchange self-signed certificate, you're basically making a new certificate.

Use the EAC to renew an Exchange self-signed certificate

1. Open the EAC and navigate to **Servers** > **Certificates**.

2. In the **Select server** list, select the Exchange server that holds the certificate that you want to renew.

3. All valid certificates have a **Renew** link in the details pane that's visible when you select the certificate from the list. Select the certificate that you want to renew, and then click **Renew** in the details pane.

4. On the **Renew Exchange certificate** page that opens, verify the read-only list of Exchange services that the existing certificate is assigned to, and then click **OK**.

Use the Exchange Management Shell to renew an Exchange self-signed certificate

To renew a self-signed certificate, use the following syntax:

```
Get-ExchangeCertificate -Thumbprint <Thumbprint> | New-ExchangeCertificate [-Force] [-PrivateKeyExportable
<$true | $false>]
```

To find the thumbprint value of the certificate that you want to renew, run the following command:

```
Get-ExchangeCertificate | where {$_.IsSelfSigned -eq $true} | Format-List
FriendlyName,Subject,CertificateDomains,Thumbprint,NotBefore,NotAfter
```

This example renews a self-signed certificate on the local Exchange server, and uses the following settings:

- The thumbprint value of the existing self-signed certificate to renew is `BC37CBE2E59566BFF7D01FEAC9B6517841475F2D`

- The *Force* switch replaces the original self-signed certificate without a confirmation prompt.

- The private key is exportable. This allows you to export the certificate and import it on other servers.

```
Get-ExchangeCertificate -Thumbprint BC37CBE2E59566BFF7D01FEAC9B6517841475F2D | New-ExchangeCertificate -Force
-PrivateKeyExportable $true
```

How do you know this worked?

To verify that you have successfully renewed an Exchange self-signed certificate, use either of the following procedures:

- In the EAC at **Servers** > **Certificates**, verify the server where you installed the certificate is selected. In the list of certificates, verify that the certificate has **Status** property value **Valid**.

- In the Exchange Management Shell on the server where you renewed the self-signed certificate, run the following command to verify the property values:

```
Get-ExchangeCertificate | where {$_.Status -eq "Valid" -and $_.IsSelfSigned -eq $true} | Format-List
FriendlyName,Subject,CertificateDomains,Thumbprint,NotBefore,NotAfter
```

Export a certificate from an Exchange server

8/3/2020 • 2 minutes to read • Edit Online

You can export a certificate from an Exchange server as a backup or to import the certificate on other clients, devices or servers. You can export certificates in the Exchange admin center (EAC) or in the Exchange Management Shell. The resulting certificate file is a password-protected binary PKCS #12 file that contains the certificate's private key, and is suitable for importing (installing) on other servers.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- In the EAC, you need to export the certificate file to a UNC path (`\\<Server>\<Share>\` or `\\<LocalServerName>\c$\`). In the Exchange Management Shell, you can specify a local path.
- To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Client Access services security" entry in the Clients and mobile devices permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the EAC to export a certificate

1. Open the EAC and navigate to **Servers** > **Certificates**.
2. In the **Select server** list, select the Exchange server that contains the certificate, click **More options** •••, and select **Export Exchange certificate**.
3. On the **Export Exchange certificate** page that opens, enter the following information:
   - **File to export to**: Enter the UNC path and file name of the certificate file. For example, `\\FileServer01\Data\Fabrikam.pfx`
   - **Password**: When you export the certificate with its private key, you need to specify a password. Exporting the certificate with its private key allows you to import the certificate on other servers.

   When you're finished, click **OK**.

Use the Exchange Management Shell to export a certificate

To export a binary certificate file that you can import on other clients or servers, use the following syntax:

```
Export-ExchangeCertificate -Thumbprint <Thumbprint> -FileName "<FilePathOrUNCPath>\<FileName>.pfx" -
BinaryEncoded -Password (ConvertTo-SecureString -String '<Password> ' -AsPlainText -Force) [-Server
<ServerIdentity>]
```

This example exports a certificate from the local Exchange server to a file with the following settings:

- The certificate that has the thumbprint value `5113ae0233a72fccb75b1d0198628675333d010e` is exported to the file `C:\Data\Fabrikam.pfx`.
- The exported certificate file is encoded by DER (not Base64).
- The password for the certificate file is `P@ssw0rd1`.

```
Export-ExchangeCertificate -Thumbprint 5113ae0233a72fccb75b1d0198628675333d010e -FileName
"C:\Data\Fabrikam.pfx" -BinaryEncoded -Password (ConvertTo-SecureString -String 'P@ssw0rd1' -AsPlainText -
Force)
```

Notes:

- The *FileName* parameter accepts a local path or a UNC path.
- You can use a similar procedure to export a pending certificate request (also known as a certificate signing request or CSR). For example, if you need to resubmit the certificate request to the certification authority, and you can't find the original certificate request file. When you export a certificate request, you typically don't need to use the *Password* parameter or the *BinaryEncoded* switch, and you save the request to a .req file. Note that you can't import an exported certificate request on another server.
- For more information, see Export-ExchangeCertificate.

How do you know this worked?

To verify that you have successfully exported a certificate from an Exchange server, try importing the certificate file on another server. For more information, see Import or install a certificate on an Exchange server.

Import or install a certificate on an Exchange server

8/3/2020 • 4 minutes to read • Edit Online

To enable encryption for one or more Exchange services, the Exchange server needs to use a certificate. SMTP communication between internal Exchange servers is encrypted by the default self-signed certificate that's installed on the Exchange server. To encrypt communication with internal or external clients, servers, or services, you'll likely want to use a certificate that's automatically trusted by all clients, services and servers that connect to your Exchange organization. For more information, see Certificate requirements for Exchange services.

You can import (install) certificates on Exchange servers in the Exchange admin center (EAC) or in the Exchange Management Shell.

These are the types of certificate files that you can import on an Exchange server:

- **PKCS #12 certificate files**: These are binary certificate files that have .cer, .crt, .der, .p12, or .pfx filename extensions, and require a password when the file contains the private key or chain of trust. Examples of these types of files include:
  - Self-signed certificates that were exported from other Exchange servers by using the EAC or the **Export-ExchangeCertificate** with the *PrivateKeyExportable* parameter value `$true`. For more information, see Export a certificate from an Exchange server.
  - Certificates that were issued by a certification authority (an internal CA like Active Directory Certificate Services, or a commercial CA).
  - Certificates that were exported from other servers (for example, Skype for Business Server).
- **PKCS #7 certificate files**: These are text certificate files that have .p7b or .p7c filename extensions. These files contain the text: `-----BEGIN CERTIFICATE-----` and `-----END CERTIFICATE-----` or `-----BEGIN PKCS7-----` and `-----END PKCS7-----`. A certificate authority might include a chain of certificates file that also needs to be installed along with the actual binary certificate file.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- In the EAC, you need to import the certificate file from a UNC path (`\\<Server>\<Share>\` or `\\<LocalServerName>\c$\`). In the Exchange Management Shell, you can specify a local path.
- In the EAC, you can import the certificate file on multiple Exchange servers at the same time (Step 4 in the procedure).
- To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Client Access services security" entry in the Clients and mobile devices permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

TIP

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the EAC to import a certificate on one or more Exchange servers

1. Open the EAC and navigate to **Servers** > **Certificates**.

2. In the **Select server** list, select the Exchange server where you want to install the certificate, click **More options** •••, and select **Import Exchange certificate**.

3. The **Import Exchange certificate** wizard opens. On the **This wizard will import a certificate from a file** page, enter the following information:

   - **File to import from**: Enter the UNC path and filename of the certificate file. For example, `\\FileServer01\Data\Fabrikam.cer`

   - **Password**: If the certificate file contains the private key or chain of trust, the file is protected by a password. Enter the password here.

   When you're finished, click **Next**.

4. In the **Specify the servers you want to apply this certificate to** page, click **Add** +

   On the **Select a server** page that opens, select the Exchange server where you want to install the certificate, and click **Add ->**. Repeat this step as many times as necessary. When you're finished selecting servers, click **OK**.

   When you're finished, click **Finish**. For next steps, see the Next steps section.

Use the Exchange Management Shell to import a certificate on an Exchange server

To import a binary certificate file (PKCS #12 files that have .cer, .crt, .der, .p12, or .pfx filename extensions), use the following syntax:

```
Import-ExchangeCertificate -FileName "<FilePathOrUNCPath>\<FileName>" -Password (ConvertTo-SecureString -
String '<Password> ' -AsPlainText -Force) [-PrivateKeyExportable <$true | $false>] [-Server <ServerIdentity>]
```

This example imports the certificate file `\\FileServer01\Data\Fabrikam.pfx` that's protected by the password P@ssw0rd1 on the local Exchange server.

```
Import-ExchangeCertificate -FileName "\\FileServer01\Data\Fabrikam.pfx" -Password (ConvertTo-SecureString -
String 'P@ssw0rd1' -AsPlainText -Force)
```

To import a chain of certificates file (PKCS #7 text files that have .p7b or .p7c filename extensions) that's associated with a certificate, use the following syntax:

```
Import-ExchangeCertificate -FileData ([Byte[]](Get-Content -Encoding Byte -Path "<FilePathOrUNCPath>" -
ReadCount 0))
```

This example imports the chain of certificates file `\\FileServer01\Data\Chain of Certificates.p7b`.

```
Import-ExchangeCertificate -FileData ([Byte[]](Get-Content -Encoding Byte -Path "\\FileServer01\Data\Chain of
Certificates.p7b" -ReadCount 0))
```

Notes:

- You need to repeat this procedure on each Exchange server where you want to import the certificate (run the command on the server, or use the *Server* parameter).

- The *FileName* and *FileData* parameters accept local paths if the certificate file is located on the Exchange server where you're running the command, and this is the same server where you want to import the certificate. Otherwise, use a UNC path.

- If you want to be able to export the certificate from the server where you're importing it, you need to use the *PrivateKeyExportable* parameter with the value `$true`.

- For more information, see Import-ExchangeCertificate.

How do you know this worked?

To verify that you have successfully imported (installed) a certificate on an Exchange server, use either of the following procedures:

- In the EAC at **Servers** > **Certificates**, verify the server where you installed the certificate is selected. The certificate should be in the list of certificates with the **Status** value **Valid**.

- In the Exchange Management Shell on the server where you installed the certificate, run the following command:

  ```
  Get-ExchangeCertificate | where {$_.Status -eq "Valid"} | Format-List
  FriendlyName,Subject,CertificateDomains,Thumbprint,NotBefore,NotAfter
  ```

Next steps

After you install the certificate on the server, you need to assign the certificate to one or more Exchange services before the Exchange server is able to use the certificate for encryption. For more information, see Assign certificates to Exchange Server services.

Configure client-specific message size limits

8/3/2020 • 7 minutes to read • Edit Online

In Exchange Server, there are several different message size limits that apply to messages as they travel through your organization. For more information, see Message size and recipient limits in Exchange Server.

However, there are client-specific message size limits you can configure for Outlook on the web (fornerly known as Outlook Web App) and email clients that use Exchange ActiveSync or Exchange Web Services (EWS). If you change the Exchange organizational, connector, or user message size limits, you likely need change the limits for Outlook on the web, ActiveSync, and EWS. These limits are described in the following tables. To change the message size limit for a specific client type, you need to change **all** the values that are described in the table.

> **NOTE**
>
> For any message size limit, you need to set a value that's larger than the actual size you want enforced. This accounts for the Base64 encoding of attachments and other binary data. Base64 encoding increases the size of the message by approximately 33%, so the value you specify should be approximately 33% larger than the actual message size you want enforced. For example, if you specify a maximum message size value of 64 MB, you can expect a realistic maximum message size of approximately 48 MB.

ActiveSync

SERVICES	CONFIGURATION FILE	KEYS AND DEFAULT VALUES	SIZE
Client Access (frontend)	`%ExchangeInstallPath%FrontEn`	`maxAllowedContentLength="3000[illegible]"` (not present by default; see comments)	bytes
Client Access (frontend)	`%ExchangeInstallPath%FrontEn`	`maxRequestLength="10240"`	kilobytes
Backend	`%ExchangeInstallPath%ClientA`	`maxAllowedContentLength="3000[illegible] bytes"` (not present by default; see comments)	bytes
Backend	`%ExchangeInstallPath%ClientA`	`maxRequestLength="10240"`	kilobytes
Backend	`%ExchangeInstallPath%ClientA`	`<add key="MaxDocumentDataSize" value="10240000">`	bytes

Comments on ActiveSync limits

By default, there is no *maxAllowedContentLength* key in the `web.config` files for ActiveSync. However, the maximum message size for ActiveSync is affected by the **maxAllowedContentLength** value that is applied to all web sites on the server. The default value is 30000000 bytes. To see these values for ActiveSync on Mailbox servers in IIS Manager, perform the following steps:

1. Do one of the following steps:

   - For the Client Access (frontend) web site, open **IIS Manager**, navigate to **Sites** > **Default Web Site** and select **Microsoft-Server-ActiveSync**.

- For the backend web site, open **IIS Manager**, navigate to **Sites** > **Exchange Back End** and select **Microsoft-Server-ActiveSync**.

2. Verify the **Features View** tab is selected at the bottom, and double-click **Configuration Editor** in the **Management** section.

3. Click the drop down arrow in the **Section** field, navigate to **system.webServer** > **security** and select **requestFiltering**.

4. In the results, expand **requestLimits**, and you'll see **maxAllowedContentLength** and the default value 30000000 (bytes).

To change the **maxAllowedContentLength** value, enter a new value in bytes, and click **Apply**. You need to change the value on the Client Access web site and the back end web site.

Note: You can change the same setting in IIS manager at **Sites** > **Default Web Site** > **Microsoft-Server-ActiveSync** or **Sites** > **Exchange Back End** > **Microsoft-Server-ActiveSync** and then **Request Filtering** in the **IIS** section > **Edit Feature Settings** in the **Actions** area > **Maximum allowed content length (Bytes)** in the **Request Limits** section.

After you change the value in IIS Manager, a new *maxAllowedContentLength* key is written to the corresponding Client Access or backend web.config file that's described in the table.

Exchange Web Services

SERVICE	CONFIGURATION FILE	KEYS AND DEFAULT VALUES	SIZE
Client Access (frontend)	`%ExchangeInstallPath%FrontEnd`	`maxAllowedContentLength="67108864"`	bytes
Backend	`%ExchangeInstallPath%ClientAc`	`maxAllowedContentLength="67108864"`	bytes
Backend	`%ExchangeInstallPath%ClientAccess\exchweb\ews\web.config`	14 instances of `maxReceivedMessageSize="67108864"` (for different combinations of http/https bindings and authentication methods)	bytes

Comments on EWS limits

- In the backend `web.config` file, there are two instances of the value `maxReceivedMessageSize="1048576"` for **UMLegacyMessageEncoderSoap11Element** bindings that you don't need to modify.

- *maxRequestLength* is an ASP.NET setting that's present in both web.config files, but isn't used by EWS, so you don't need to modify it.

Outlook on the web

SERVICE	CONFIGURATION FILE	KEYS AND DEFAULT VALUES	SIZE
Client Access (frontend)	`%ExchangeInstallPath%FrontEnd`	`maxAllowedContentLength="35000000"`	bytes
Client Access (frontend)	`%ExchangeInstallPath%FrontEnd`	`maxRequestLength="35000"`	kilobytes
Backend	`%ExchangeInstallPath%ClientAc`	`maxAllowedContentLength="35000000"`	bytes

SERVICE	CONFIGURATION FILE	KEYS AND DEFAULT VALUES	SIZE
Backend	`%ExchangeInstallPath%ClientAc`	`maxRequestLength="35000"`	kilobytes
Backend	`%ExchangeInstallPath%ClientAccess\Owa\web.config`	2 instances of `maxReceivedMessageSize="35000000"` (for http and https bindings)	bytes
Backend	`%ExchangeInstallPath%ClientAccess\Owa\web.config`	2 instances of `maxStringContentLength="35000000"` (for http and https bindings)	bytes

Comments on Outlook on the web limits

- In the backend `web.config` file, there's an instance of the value `maxStringContentLength="102400"` for the **MsOnlineShellService** binding that you don't need to modify.

What do you need to know before you begin?

- Estimated time to complete: 15 minutes

- Exchange permissions don't apply to the procedures in this topic. These procedures are performed in the operating system of the Exchange server.

- Changes you save to the web.config configuration file are applied after you restart IIS.

- To allow for the 33% increase in size due to Base64 encoding, multiply your desired new maximum size value in megabytes by 4/3. To convert the value into kilobytes, multiply by 1024. To convert the value into bytes, multiply by 1048756 (1024*1024). Note that the size increase caused by Base64 encoding could be greater than 33%, and depends on several factors (for example, the attachment size, file type, compression, and the email client).

- Any customized Exchange or Internet Information Server (IIS) settings that you made in Exchange XML application configuration files on the Exchange server (for example, web.config files or the EdgeTransport.exe.config file) **will be overwritten** when you install an Exchange CU. Be sure save this information so you can easily re-apply the settings after the install. After you install the Exchange CU, you need to re-configure these settings.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

Use Notepad to configure a client-specific message size limit

1. Open the appropriate web.config files in Notepad. For example, to open the web.config files for EWS clients, run the following commands:

```
Notepad %ExchangeInstallPath%ClientAccess\exchweb\ews\web.config
```

```
Notepad %ExchangeInstallPath%FrontEnd\HttpProxy\ews\web.config
```

2. Find the relevant keys in the appropriate web.config files as described in the tables earlier in the topic. For example, for EWS clients, find the *maxAllowedContentLength* key in the Client Access and backend web.config files and all 14 instances of the value `maxReceivedMessageSize="67108864"` in the backend web.config file.

   ```
   <requestLimits maxAllowedContentLength="67108864" />
   ...maxReceivedMessageSize="67108864"...
   ```

   For example, to allow a Base64 encoded maximum message size of approximately 64 MB, change all instances of `67108864` to `89478486` (64*4/3*1048756):

   ```
   <requestLimits maxAllowedContentLength="89478486" />
   ...maxReceivedMessageSize="89478486"...
   ```

3. When you're finished, save and close the web.config files.

4. Restart IIS on the Exchange server by using either of the following methods:

   - Open IIS Manager, select the server, and in the **Actions** pane, click **Restart**.

   - Run the following commands from an elevated command prompt (a Command Prompt window you open by selecting **Run as administrator**):

     ```
     net stop w3svc /y
     ```

     ```
     net start w3svc
     ```

Configure client-specific message size limits from the command line

Instead of using Notepad, you can also configure the client-specific message size limits from the command line. Open an elevated command prompt on the Exchange server (a Command Prompt window you open by selecting **Run as administrator**) and run the appropriate commands for the limits that you want to configure.

NOTE

- The size values in the commands are the default values, so you'll need to change them.
- Pay attention to whether the value is in bytes or kilobytes.

ActiveSync

```
%windir%\system32\inetsrv\appcmd.exe set config "Default Web Site/Microsoft-Server-ActiveSync/" -
section:system.webServer/security/requestFiltering /requestLimits.maxAllowedContentLength:30000000
%windir%\system32\inetsrv\appcmd.exe set config "Default Web Site/Microsoft-Server-ActiveSync/" -
section:system.web/httpRuntime /maxRequestLength:10240
%windir%\system32\inetsrv\appcmd.exe set config "Exchange Back End/Microsoft-Server-ActiveSync/" -

%windir%\system32\inetsrv\appcmd.exe set config "Exchange Back End/ews/" -section:system.serviceModel/bindings
/customBinding.[name='EWSNegotiateHttpsBinding'].httpsTransport.maxReceivedMessageSize:67108864
%windir%\system32\inetsrv\appcmd.exe set config "Exchange Back End/ews/" -section:system.serviceModel/bindings
/customBinding.[name='EWSNegotiateHttpBinding'].httpTransport.maxReceivedMessageSize:67108864
%windir%\system32\inetsrv\appcmd.exe set config "Exchange Back End/ews/" -section:system.serviceModel/bindings
/customBinding.[name='EWSWSSecurityHttpsBinding'].httpsTransport.maxReceivedMessageSize:67108864
%windir%\system32\inetsrv\appcmd.exe set config "Exchange Back End/ews/" -section:system.serviceModel/bindings
/customBinding.[name='EWSWSSecurityHttpBinding'].httpTransport.maxReceivedMessageSize:67108864
%windir%\system32\inetsrv\appcmd.exe set config "Exchange Back End/ews/" -section:system.serviceModel/bindings
/customBinding.[name='EWSWSSecuritySymmetricKeyHttpsBinding'].httpsTransport.maxReceivedMessageSize:67108864
%windir%\system32\inetsrv\appcmd.exe set config "Exchange Back End/ews/" -section:system.serviceModel/bindings
/customBinding.[name='EWSWSSecuritySymmetricKeyHttpBinding'].httpTransport.maxReceivedMessageSize:67108864
%windir%\system32\inetsrv\appcmd.exe set config "Exchange Back End/ews/" -section:system.serviceModel/bindings
/customBinding.[name='EWSWSSecurityX509CertHttpsBinding'].httpsTransport.maxReceivedMessageSize:67108864
%windir%\system32\inetsrv\appcmd.exe set config "Exchange Back End/ews/" -section:system.serviceModel/bindings
/customBinding.[name='EWSWSSecurityX509CertHttpBinding'].httpTransport.maxReceivedMessageSize:67108864
%windir%\system32\inetsrv\appcmd.exe set config "Exchange Back End/ews/" -section:system.serviceModel/bindings
/webHttpBinding.[name='EWSStreamingNegotiateHttpsBinding'].maxReceivedMessageSize:67108864
%windir%\system32\inetsrv\appcmd.exe set config "Exchange Back End/ews/" -section:system.serviceModel/bindings
/webHttpBinding.[name='EWSStreamingNegotiateHttpBinding'].maxReceivedMessageSize:67108864
```

Outlook on the web

```
%windir%\system32\inetsrv\appcmd.exe set config "Default Web Site/owa/" -
section:system.webServer/security/requestFiltering /requestLimits.maxAllowedContentLength:35000000
%windir%\system32\inetsrv\appcmd.exe set config "Default Web Site/owa/" -section:system.web/httpRuntime
/maxRequestLength:35000
%windir%\system32\inetsrv\appcmd.exe set config "Exchange Back End/owa/" -
section:system.webServer/security/requestFiltering /requestLimits.maxAllowedContentLength:35000000
%windir%\system32\inetsrv\appcmd.exe set config "Exchange Back End/owa/" -section:system.web/httpRuntime
/maxRequestLength:35000
%windir%\system32\inetsrv\appcmd.exe set config "Exchange Back End/owa/" -section:system.serviceModel/bindings
/webHttpBinding.[name='httpsBinding'].maxReceivedMessageSize:35000000
%windir%\system32\inetsrv\appcmd.exe set config "Exchange Back End/owa/" -section:system.serviceModel/bindings
/webHttpBinding.[name='httpBinding'].maxReceivedMessageSize:35000000
%windir%\system32\inetsrv\appcmd.exe set config "Exchange Back End/owa/" -section:system.serviceModel/bindings
/webHttpBinding.[name='httpsBinding'].readerQuotas.maxStringContentLength:35000000
%windir%\system32\inetsrv\appcmd.exe set config "Exchange Back End/owa/" -section:system.serviceModel/bindings
/webHttpBinding.[name='httpBinding'].readerQuotas.maxStringContentLength:35000000
```

How do you know this worked?

To verify that you have successfully configured the client-specific message size limit, you need to send a test message to and from a mailbox by using the affected client. You can try a few smaller attachments or one large attachment so the test messages are approximately 33% less than the value you configured. For example, a configured value of 85 MB results in a realistic maximum message size of approximately 64 MB.

Availability service in Exchange Server

8/3/2020 • 2 minutes to read • Edit Online

The Availability service makes free/busy information available to Outlook and Outlook on the web (formerly known as Outlook Web App) clients. The Availability service improves information workers' calendaring and meeting scheduling experience by providing secure, consistent, and up-to-date free/busy information.

Outlook and Outlook on the web use the Availability service to perform the following tasks:

- Retrieve current free/busy information for Exchange mailboxes
- Retrieve current free/busy information from other Exchange organizations
- Retrieve published free/busy information from public folders for mailboxes on previous versions of Exchange
- View attendee working hours
- Show meeting time suggestions

How the availability service works in Exchange Server

The Availability service retrieves free/busy information directly from the target Exchange mailbox.

Outlook uses the Exchange Autodiscover service to obtain the URL of the Availability service. For more information about the Autodiscover service, see Autodiscover service.

You can use the Exchange Management Shell to configure the Availability service. You can't use the Exchange admin center (EAC) to configure the Availability service.

The Availability service API is available as a web service to let developers write third-party integration tools.

Availability service and automatic reply messages

The Availability service provides access to automatic-reply messages that users send when they are out of the office or away for an extended period of time.

Information workers use the Automatic Replies feature (formerly known as Out of Office) in Outlook and Outlook on the web to alert others when they're unavailable to respond to email messages. This functionality makes it easier to set and manage automatic reply messages for both information workers and administrators.

Methods used to retrieve free/busy information

The following table lists the methods used to retrieve free/busy information in different single-forest topologies.

CLIENT	SOURCE MAILBOX RETRIEVING FREE/BUSY INFORMATION	TARGET MAILBOX	FREE/BUSY RETRIEVAL METHOD
Outlook 2010 or later	Exchange 2010 or later	Exchange 2010 or later	The Availability service reads free/busy information from the target mailbox.

CLIENT	SOURCE MAILBOX RETRIEVING FREE/BUSY INFORMATION	TARGET MAILBOX	FREE/BUSY RETRIEVAL METHOD
Outlook on the web or Outlook Web App	Exchange 2010 or later	Exchange 2010 or later	Outlook on the web or Outlook Web App calls the Availability service API, which reads the free/busy information from the target mailbox.

Configure the Availability service for cross-forest topologies

8/3/2020 • 4 minutes to read • Edit Online

The Availability service improves information workers' free/busy information by providing secure, consistent, and up-to-date free/busy information to clients that are running Outlook. By default, this service is installed with Exchange Server. In cross-forest topologies where all connecting clients are running Outlook, the Availability service is the only method of retrieving free/busy information. You can use the Exchange Management Shell to configure the Availability service for cross-forest topologies.

> **NOTE**
>
> You can't use the Exchange admin center (EAC) to configure the Availability service for cross-forest topologies.

Using the Availability service in trusted and untrusted forests

You can use the Availability service in cross-forest topologies across trusted or untrusted forests. The type of free/busy information that's available depends on if you're using a trusted or untrusted forest.

Trusted forests: In trusted forests, you can configure the Availability service to retrieve free/busy information on a per-user basis. When the Availability service is configured to retrieve free/busy information on a per-user basis, the service can make cross-forest requests on behalf of a particular user. This allows a user in a remote forest to retrieve detailed free/busy information for someone who is not in the same forest.

Untrusted forests: In untrusted forests, you can only configure the Availability service to retrieve free/busy information on an organization-wide basis. When the Availability service makes free/busy cross-forest requests at the organizational level, free/busy information is returned for each user in the organization. In untrusted forests, it isn't possible to control the level of free/busy information that's returned on a per-user basis.

Configuring Windows for cross-forest topologies

By default, a global address list (GAL) contains mail recipients from a single forest. If you have a cross-forest environment, we recommend using Microsoft Identity Lifecycle Manager (ILM) 2007 Feature Pack 1 (FP1) to ensure that the GAL in any given forest contains mail recipients from other forests. ILM 2007 FP1 creates mail users that represent recipients from other forests, thereby allowing users to view them in the GAL and send mail. For example, users in Forest A appear as a mail user in Forest B and vice versa. Users in the target forest can then select the mail user object that represents a recipient in another forest to send mail.

To enable GAL synchronization, you create management agents that import mail-enabled users, contacts, and groups from designated Active Directory services into a centralized metadirectory. In the metadirectory, mail-enabled objects are represented as mail users. Groups are represented as contacts without any associated membership. The management agents then export these mail users to an organizational unit in the specified target forest.

What do you need to know before you begin?

- Estimated time to complete each procedure: 5 minutes.
- To open the Exchange Management Shell, see Open the Exchange Management Shell.

- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Availability Service Permissions" entries in the Clients and mobile devices permissions topic.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

- There are additional considerations when the target forest is Exchange Server 2013 or Exchange Server 2016. See Cross forest free/busy lookup fails when target forest is Exchange Server 2013 or Exchange Server 2016 for more information.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the Exchange Management Shell to configure per-user free/busy information in a trusted cross-forest topology

This example configures the Availability service to retrieve per-user free/busy information on a Mailbox server in the target forest.

```
Get-MailboxServer | Add-ADPermission -Accessrights Extendedright -Extendedrights "ms-Exch-EPI-Token-
Serialization" -User "<Remote Forest Domain>\Exchange servers"
```

This example defines the free/busy access method that the Availability service uses on the local Mailbox server in the source forest. The local Mailbox server is configured to access free/busy information from the forest ContosoForest.com on a per-user basis. This example uses the service account to retrieve free/busy information.

```
Add-AvailabilityAddressSpace -Forestname ContosoForest.com -AccessMethod PerUserFB -UseServiceAccount $true
```

> **NOTE**
>
> To configure bidirectional cross-forest availability, repeat these steps in the Exchange Management Shell for the target forest.

If you choose to configure cross-forest availability with trust, and also choose to use a service account (instead of specifying organization-wide or per-user credentials), you must extend permissions as shown in the example in the next section, "Use the Exchange Management Shell to configure trusted cross-forest availability with a service account." Performing that procedure in the target forest gives Mailbox servers in the source forest permission to serialize the original user context.

Use the Exchange Management Shell to configure trusted cross-forest availability with a service account

This example configures trusted cross-forest availability with a service account.

```
Get-MailboxServer | Add-ADPermission -Accessrights Extendedright -Extendedright "ms-Exch-EPI-Token-
Serialization" -User "<Remote Forest Domain>\Exchange servers"
```

For detailed information about syntax and parameters, see the following topics:

- Get-MailboxServer
- Add-ADPermission
- Add-AvailabilityAddressSpace
- Set-AvailabilityConfig

Use the Exchange Management Shell to configure organization-wide free/busy information in an untrusted cross-forest topology

This example sets the organization-wide account on the availability configuration object to configure the access level for free/busy information in the target forest.

```
Set-AvailabilityConfig -OrgWideAccount "Contoso.com\User"
```

This example adds the Availability address space configuration object for the source forest, and you're prompted to enter the credentials for organization-wide user in Contoso.com domain.

```
Add-AvailabilityAddressspace -Forestname Contoso.com -Accessmethod OrgWideFB -Credential (Get-Credential)
```

Planning and deployment for Exchange Server

8/3/2020 • 5 minutes to read • Edit Online

This topic contains links to topics and information about planning for and then deploying Exchange Server 2016 or Exchange Server 2019.

> **IMPORTANT**
>
> Make sure you read the Release notes for Exchange Server topics before you begin your deployment. The release notes contain important information on issues you might encounter during and after your deployment.

Plan for Exchange Server

Use the information at following links to help plan your deployment of Exchange 2016 or Exchange 2019 into your organization.

> **IMPORTANT**
>
> See the Establish an Exchange 2016 or Exchange 2019 test environment section later in this topic for information about installing Exchange 2019 in a test environment.

Exchange architecture

Establish an Exchange 2016 or Exchange 2019 test environment

Before you install your first Exchange server, we recommend that you install Exchange in an isolated test environment. This approach reduces the risk of end-user downtime and negative ramifications to the production environment.

The test environment will act as your "proof of concept" for your new Exchange design and make it possible to move forward or roll back any implementations before deploying into your production environments. Having an exclusive test environment for validation and testing allows you to do pre-installation checks for your future production environments. By installing in a test environment first, we believe that your organization will have a better likelihood of success in a full production implementation.

For many organizations, the costs of building a test lab may be high because of the need to duplicate the production environment. To reduce the hardware costs associated with a prototype lab, we recommend the use of virtualization by using Hyper-V technologies in Windows Server. Hyper-V enables server virtualization, allowing multiple virtual operating systems to run on a single physical machine.

For more detailed information about Hyper-V, see Server Virtualization. For information about the Microsoft support of production Exchange servers on hardware virtualization software, see Exchange Server virtualization.

Deploy Exchange 2016 or Exchange 2019

During the deployment phase, you install Exchange into your organization. Before you begin the deployment phase, you should plan your Exchange organization. For more information, see the Plan for Exchange Server section earlier in this topic.

Use the information at the following links to help you deploy Exchange.

Prepare Active Directory and domains for Exchange

> Learn about the steps you need to take to prepare your Active Directory forest for Exchange 2019 and the changes Exchange makes to your forest.

Install Exchange Mailbox servers using the Setup wizard

> Learn about using the Setup wizard to install Mailbox servers.

Use unattended mode in Exchange Setup

> Learn about using the unattended setup at the command line to install, remove, update, and recover Exchange servers.

Install Exchange Edge Transport servers using the Setup wizard

> Learn about using the Setup wizard to install Edge Transport servers in a perimeter network.

Upgrade Exchange to the latest Cumulative Update

> Learn about finding and installing the latest Cumulative Update (CU) for the Exchange servers in your organization.

Exchange Server Hybrid Deployments

> Read this topic for information that will help you deploy Exchange in an existing hybrid deployment.

Exchange Server post-installation tasks

> Learn about post-installation tasks to complete your Exchange installation.

Exchange Setup

You can use different types and modes of Exchange Setup to install and maintain the various editions and versions of Exchange.

Exchange editions and versions

Exchange is available in two server editions: Standard Edition and Enterprise Edition. The edition you install is defined by your product key (the only available download can install both versions). For more information, see Exchange licensing FAQs.

Types of Exchange Setup

You have the following options for Exchange Setup:

- **Exchange Setup wizard**: Running Setup.exe without any command line switches provides an interactive experience where you're guided by the Exchange 2019 Setup wizard.

- **Exchange unattended setup**: Running Setup.exe with command line switches enables you to install Exchange from an interactive command line or through a script.

Modes of Exchange Setup

Exchange setup includes the following modes:

- **Install**: Install a new server role (Mailbox server, Edge Transport server, or Management tools). This mode is available in the Exchange Setup wizard and unattended setup.

- **Uninstall**: Remove the Exchange installation from a computer. You can use this mode from both the Exchange Setup wizard and unattended setup.

- **Upgrade**: Install a CU on an existing Exchange server. You can use this mode from both the Exchange Setup wizard and unattended setup.

  > **NOTE**
  >
  > Exchange doesn't support in-place upgrades from previous versions. This mode is used only to install CUs.

- **RecoverServer**: You need to recover data from the Exchange server after a catastrophic failure. To do this, you install a new Windows server with the same FQDN as the failed server (for example, mailbox01.contoso.com), and then run Exchange Setup with the */Mode:RecoverServer* switch without specifying the Exchange server roles to restore.

Setup detects the Exchange server object in Active Directory and installs the corresponding files and configuration automatically. After you recover the server, you can restore databases and reconfigure any additional settings. To run in `RecoverServer` mode:

- Exchange can't be already installed on the server.
- The Exchange server object must exist in Active Directory.
- You can only use unattended setup.

> **NOTE**
>
> You must complete one mode of Setup before you can use another mode.

Exchange Server system requirements

8/3/2020 • 13 minutes to read • Edit Online

Before you install Exchange Server 2019, we recommend that you review this topic to ensure your network, hardware, software, clients, and other elements meet the requirements for Exchange 2019. Also, make sure you understand the coexistence scenarios that are supported for Exchange 2019 and earlier versions of Exchange.

To actually install Exchange 2019, see Deploy new installations of Exchange.

Supported coexistence scenarios for Exchange 2019

The supported coexistence scenarios between Exchange 2019 and earlier versions of Exchange are described in the following table:

EXCHANGE VERSION	EXCHANGE 2019 ORGANIZATION COEXISTENCE
Exchange 2010 and earlier versions	Not supported
Exchange 2013	Supported with Exchange 2013 Cumulative Update 21 (CU21) or later on all Exchange 2013 servers in the organization, including Edge Transport servers.
Exchange 2016	Supported with Exchange 2016 CU11 or later on all Exchange 2016 servers in the organization, including Edge Transport servers.
Mixed Exchange 2013 and Exchange 2016 organization	Supported if all Exchange 2013 and Exchange 2016 servers in the organization meet the requirements as previously described in this table.

Supported hybrid deployment scenarios for Exchange 2019

Exchange 2019 supports hybrid deployments with Microsoft 365 or Office 365 organizations that have been upgraded to the latest version of Microsoft 365 or Office 365. For more information about specific hybrid deployments, see Hybrid deployment prerequisites.

Network and directory server requirements for Exchange 2019

The requirements for the network and the directory servers in your Exchange 2019 organization are described in the following table:

COMPONENT	REQUIREMENT
Domain controllers	All domain controllers in the forest need to be running one of the following versions of Windows Server: • Windows Server 2019 Standard or Datacenter • Windows Server 2016 Standard or Datacenter • Windows Server 2012 R2 Standard or Datacenter
Active Directory forest	The Active Directory forest functional level is **Windows Server 2012 R2** or higher.

COMPONENT	REQUIREMENT
Active Directory site	The Active Directory site where you install the Exchange Server must contain at least one writeable domain controller that's also a global catalog server, or the installation will fail. Furthermore, you can't install the Exchange server and then remove the domain controller from the Active Directory site.
DNS namespace	Exchange 2019 supports the following DNS namespaces: • Contiguous • Noncontiguous • Single label domains • Disjoint For more information about DNS namespaces that are supported by Exchange, see KB2269838.
IPv6	Exchange 2013 and later support IPv6 only when IPv4 is also installed and enabled on the Exchange server. If you deploy Exchange in this configuration, and your network supports IPv4 and IPv6, all Exchange servers can send data to and receive data from devices, servers, and clients that use IPv6 addresses. For more information, see IPv6 Support in Exchange 2013.

Directory server architecture for Exchange 2019

Active Directory domain controllers on 64-bit hardware with a 64-bit version of Windows Server will increase directory service performance for Exchange 2019.

Installing Exchange 2019 on directory servers

For security and performance reasons, we don't recommend installing Exchange 2019 on Active Directory directory servers. Only install Exchange 2019 on member servers.

To learn more about the issues that you'll encounter when you install Exchange on a directory server, see Installing Exchange on a domain controller is not recommended [WarningInstallExchangeRolesOnDomainController]. After Exchange is installed, changing the server role from a member server to a directory server or vice-versa isn't supported.

Hardware requirements for Exchange 2019

For information about deploying Exchange in a virtualized environment, see Exchange Server virtualization.

COMPONENT	REQUIREMENT	NOTES
Processor	Either of the following types of 64-bit processors: • Intel processor that supports Intel 64 architecture (formerly known as Intel EM64T). • AMD processor that supports the AMD64 platform. **Notes**: • Intel Itanium IA64 processors are not supported. • Recommended supported processor sockets is up to 2 on physical machines.	See the Supported operating systems for Exchange 2019 section later in this topic for supported operating systems.

COMPONENT	REQUIREMENT	NOTES
Memory	Varies by Exchange server role: • **Mailbox**: 128 GB minimum recommended • **Edge Transport**: 64 GB minimum recommended.	Exchange 2019 has large memory support (up to 256 GB).
Paging file size	Set the paging file minimum and maximum value to the same size: 25% of installed memory.	None
Disk space	• At least 30 GB of free space on the drive where you're installing Exchange. • At least 200 MB of free space on the system drive. • At least 500 MB of free space on the drive that contains the message queue database.	None
Screen resolution	1024 x 768 pixels (XGA) or higher	None
File system	**NTFS**: Required on partitions that contain the following types of files: • The System partition. • Exchange binaries. • Files generated by Exchange diagnostic logging. • Transport database files (for example, the mail queue database). **ReFS**: Supported on partitions that contain the following types of Exchange files: • Mailbox databases. • Transaction logs.	None

Supported operating systems for Exchange 2019

EXCHANGE COMPONENT	REQUIREMENT
Mailbox and Edge Transport server roles	Windows Server 2019 Standard or Datacenter
Management tools	One of the following versions of Windows: • Windows Server 2019 Standard or Datacenter • 64-bit edition of Windows 10

Notes:

- Installing Exchange 2019 on a computer that's running Windows Server Core is fully supported and recommended. The Desktop Experience feature is no longer required.
- Installing Exchange 2019 on a computer that's running Nano Server isn't supported.

Supported Powershell versions for Exchange 2019 servers

Exchange 2019 servers support the version of PowerShell that's included in the release of Windows Server where Exchange is installed. Don't install stand-alone downloads of WMF or PowerShell on Exchange servers.

Installing other software on Exchange 2019 servers

We don't support installing Office client or Office server software on Exchange servers (for example, SharePoint Server, Skype for Business Server, Office Online Server, or Project Server). Other software that you want to install on an Exchange 2019 server needs to be designed to run on the same computer as Exchange Server.

Supported .NET Framework versions for Exchange 2019

We strongly recommend that you use the latest version of the .NET Framework that's supported by the release of Exchange you're installing.

> **IMPORTANT**
>
> • **Releases of .NET Framework that aren't listed in the table below aren't supported on any release of Exchange 2019**. This includes minor and patch-level releases of .NET Framework.
>
> • The complete prerequisite list for Exchange 2019 is available here.

EXCHANGE 2019 VERSION	.NET FRAMEWORK 4.8	.NET FRAMEWORK 4.7.2
CU4, CU5, CU6	Supported	
CU2, CU3	Supported	Supported
RTM, CU1		Supported

Supported clients (with latest updates) in Exchange 2019

- Microsoft 365 Apps for enterprise
- Outlook 2019
- Outlook 2016
- Outlook 2013
- Outlook for Mac for Office 365
- Outlook 2016 for Mac

> **IMPORTANT**
>
> You need KB3140245 to apply registry keys to enable TLS 1.1 & 1.2 support for Windows 7. Otherwise, Outlook 2013 and 2016 will not work on Windows 7.

Lync/Skype For Business Server integration with Exchange 2019

If you're integrating Lync presence and instant messaging with Exchange Server, Lync Server 2013 Cumulative Update 10 or later is required. If you're integrating Skype for Business presence and instant messaging with Exchange Server, Skype for Business Server Cumulative Update 7 or later is required.

Before you install Exchange Server 2016, we recommend that you review this topic to ensure your network, hardware, software, clients, and other elements meet the requirements for Exchange 2016. Also, make sure you understand the coexistence scenarios that are supported for Exchange 2016 and earlier versions of Exchange.

To actually install Exchange 2016, see Deploy new installations of Exchange.

Supported coexistence scenarios for Exchange 2016

The following table lists the scenarios in which coexistence between Exchange 2016 and earlier versions of Exchange is supported.

EXCHANGE VERSION	EXCHANGE ORGANIZATION COEXISTENCE
Exchange 2007 and earlier versions	Not supported
Exchange 2010	Supported with Update Rollup 11 for Exchange 2010 SP3 or later on all Exchange 2010 servers in the organization, including Edge Transport servers.
Exchange 2013	Supported with Exchange 2013 Cumulative Update 10 or later on all Exchange 2013 servers in the organization, including Edge Transport servers.
Mixed Exchange 2010 and Exchange 2013 organization	Supported with the following minimum versions of Exchange: • Update Rollup 11 Exchange 2010 SP3 or later on all Exchange 2010 servers in the organization, including Edge Transport servers. • Exchange 2013 Cumulative Update 10 or later on all Exchange 2013 servers in the organization, including Edge Transport servers.

Supported hybrid deployment scenarios for Exchange 2016

Exchange 2016 supports hybrid deployments with Microsoft 365 or Office 365 organizations that have been upgraded to the latest version of Microsoft 365 or Office 365. For more information about specific hybrid deployments, see Hybrid Deployment Prerequisites.

Network and directory server requirements for Exchange 2016

The following table lists the requirements for the network and the directory servers in your Exchange 2016 organization.

COMPONENT	REQUIREMENT
Domain controllers	All domain controllers in the forest need to be running one of the following versions of Windows Server: • Windows Server 2019 Standard or Datacenter • Windows Server 2016 Standard or Datacenter • Windows Server 2012 R2 Standard or Datacenter • Windows Server 2012 Standard or Datacenter • Windows Server 2008 R2 Standard or Enterprise • Windows Server 2008 R2 Datacenter RTM or later
Active Directory forest	The Active Directory forest functional level is Windows Server 2008 R2 or higher.

COMPONENT	REQUIREMENT
Active Directory site	• The Active Directory site where you install the Exchange Server must contain at least one writeable domain controller that's also a global catalog server, or the installation will fail. • Furthermore, you can't install the Exchange server and then remove the domain controller from the Active Directory site.
DNS namespace support	Exchange 2016 supports the following domain name system (DNS) namespaces: • Contiguous • Noncontiguous • Single label domains • Disjoint For more information about DNS namespaces supported by Exchange, see Microsoft Knowledge Base article 2269838, Microsoft Exchange compatibility with Single Label Domains, Disjoined Namespaces, and Discontiguous Namespaces.
IPv6 support	In Exchange 2016, IPv6 is supported only when IPv4 is also installed and enabled. If Exchange 2016 is deployed in this configuration, and the network supports IPv4 and IPv6, all Exchange servers can send data to and receive data from devices, servers, and clients that use IPv6 addresses. For more information, see IPv6 Support in Exchange 2013.

Directory server architecture for Exchange 2016

The use of 64-bit Active Directory domain controllers increases directory service performance for Exchange 2016.

> **NOTE**
>
> In multi-domain environments, on Windows Server 2008 domain controllers that have the Active Directory language locale set to Japanese (ja-jp), your servers may not receive some attributes that are stored on an object during inbound replication. For more information, see KB949189.

Installing Exchange 2016 on directory servers

For security and performance reasons, we recommend that you install Exchange 2016 only on member servers and not on Active Directory directory servers. To learn about the issues you can face when installing Exchange 2016 on a directory server, see Installing Exchange on a domain controller is not recommended [WarningInstallExchangeRolesOnDomainController]. After Exchange 2016 is installed, changing its role from a member server to a directory server, or vice versa, isn't supported.

Hardware requirements for Exchange 2016

For information about deploying Exchange in a virtualized environment, see Exchange Server virtualization.

COMPONENT	REQUIREMENT	NOTES

COMPONENT	REQUIREMENT	NOTES
Processor	Either of the following types of 64-bit processors: • Intel processor that supports Intel 64 architecture (formerly known as Intel EM64T). • AMD processor that supports the AMD64 platform. **Note**: Intel Itanium IA64 processors are not supported.	For more information, see Sizing Exchange 2016 Deployments. See the Supported operating systems for Exchange 2016 section later in this topic for supported operating systems.
Memory	Varies by Exchange server role: • **Mailbox**: 8 GB minimum. • **Edge Transport**: 4 GB minimum.	For more information, see Sizing Exchange 2016 Deployments.
Paging file size	Set the paging file minimum and maximum value to the same size: • **Less than 32 GB of RAM installed**: Physical RAM plus 10MB, up to a maximum value of 32GB (32,778MB). • **32 GB of RAM or more installed**: 32GB	None
Disk space	• At least 30 GB of free space on the drive where you're installing Exchange, plus an additional 500 MB for each Unified Messaging (UM) language pack that you plan to install. • At least 200 MB of free space on the System drive. • At least 500 MB of free space on the drive that contains the message queue database.	For more information, see Sizing Exchange 2016 Deployments.
Drive	DVD-ROM drive, local or network accessible.	None
Screen resolution	1024 x 768 pixels (XGA) or higher	None
File format	**NTFS**: Required on partitions that contain the following types of files: • The System partition. • Exchange binaries. • Files generated by Exchange diagnostic logging. • Transport database files (for example, the mail queue database). **ReFS**: Supported on partitions that contain the following types of Exchange files: • Mailbox databases. • Transaction logs. • Content indexing files.	None

Supported operating systems for Exchange 2016

Important: We don't support the installation of Exchange 2016 on a computer that's running Windows Server Core or Nano Server. The Windows Server Desktop Experience feature needs to be installed. To install Exchange 2016, you need to do one of the following to install the Desktop Experience on Windows Server prior to starting Exchange 2016 Setup:

- **Windows Server 2012 and Windows Server 2012 R2**: Run the following command in Windows PowerShell

  ```
  Install-WindowsFeature Server-Gui-Mgmt-Infra,Server-Gui-Shell -Restart
  ```

- **Windows Server 2016**: Install Windows Server 2016 and choose the **Desktop Experience** installation option. If a computer is running Windows Server 2016 Core mode and you want to install Exchange 2016 on it, you'll need to reinstall the operating system and choose the **Desktop Experience** installation option.

COMPONENT	REQUIREMENT
Mailbox and Edge Transport server roles	• Windows Server 2016 Standard or Datacenter* • Windows Server 2012 R2 Standard or Datacenter • Windows Server 2012 Standard or Datacenter
Management tools	One of the following versions of Windows: • Windows Server 2016 Standard or Datacenter* • Windows Server 2012 R2 Standard or Datacenter • Windows Server 2012 Standard or Datacenter • 64-bit edition of Windows 10 • 64-bit edition of Windows 8.1

* Requires Exchange Server 2016 Cumulative Update 3 or later.

Supported Windows Management Framework versions for Exchange 2016

Exchange 2016 only supports the version of Windows Management Framework that's built in to the release of Windows that you're installing Exchange on. Don't install versions of Windows Management Framework that are made available as stand-alone downloads on servers running Exchange.

Installing other software on Exchange 2016 servers

We don't support installing Office clients or other Office server products (for example, SharePoint Server, Skype for Business Server, Office Online Server, or Project Server) on Exchange 2016 servers. Software that you want to install on an Exchange 2016 server needs to be designed to run on the same computer as Exchange Server.

Supported .NET Framework versions for Exchange 2016

We strongly recommend that you use the latest version of .NET Framework that's supported by the release of Exchange you're installing.

> **IMPORTANT**
>
> • **Releases of .NET Framework that aren't listed in the table below are not supported on any release of Exchange 2016**. This includes minor and patch-level releases of .NET Framework.
>
> • The complete prerequisite list for Exchange 2016 is available here.

EXCHANGE 2016 VERSION	.NET FRAMEWORK 4.8	.NET FRAMEWORK 4.7.2	.NET FRAMEWORK 4.7.1	.NET FRAMEWORK 4.6.2
CU15, CU16, CU17	Supported			
CU13, CU14	Supported	Supported		
CU11, CU12		Supported	Supported	
CU10			Supported	
CU8, CU9			Supported	Supported
CU5, CU6, CU7				Supported

Note: For older versions, see Exchange Server supportability matrix.

Supported clients (with latest updates) in Exchange 2016

- Microsoft 365 Apps for enterprise
- Outlook 2019
- Outlook 2016
- Outlook 2013
- Outlook 2010 SP2
- Outlook 2016 for Mac
- Outlook for Mac for Office 365

Exchange third-party clients

Exchange Server offers several well-known protocols, and publishes APIs that third-party vendors often write clients for.

Microsoft makes no warranties, expressed or implied, as to the overall suitability, fitness, compatibility, or security of clients that are created by third-party developers.

If you want to use a third-party client that uses our protocols or APIs, we recommend that you thoroughly review and test all considerations (functionality, security, maintenance, management, and so on) before you deploy the client in the enterprise workspace. We also recommend that you make sure that the third-party vendor offers an appropriate Enterprise Support Agreement (ESA).

Exchange Server prerequisites

8/3/2020 • 10 minutes to read • Edit Online

This topic provides the steps for installing the necessary Windows Server operating system prerequisites for Exchange Server 2016 and Exchange Server 2019 Mailbox servers and Edge Transport servers, and also the Windows prerequisites for installing the Exchange Management Tools on Windows client computers.

After you've prepared your environment for Exchange Server, use the Exchange Deployment Assistant for the next steps in your actual deployment. For information on hybrid deployments, see Exchange Server Hybrid Deployments.

To actually install Exchange 2016 and Exchange 2019, see Deploy new installations of Exchange.

TIP

- Looking for Exchange 2013 prerequisites? See Exchange 2013 prerequisites.
- Remote Registry Service must be set to Automatic and cannot be Disabled. For recommended Security Guidelines, See Security Guidelines regarding Remote Registry.
- Have you heard about the Exchange Server Deployment Assistant? It's a free online tool that helps you quickly deploy Exchange Server in your organization by asking you a few questions and creating a customized deployment checklist just for you. If you want to learn more about it, go to Microsoft Exchange Server Deployment Assistant.

What do you need to know before you begin?

- Verify that your Active Directory meets the requirements for Exchange 2019: Exchange 2019 Network and directory servers.
- Verify that your Active Directory meets the requirements for Exchange 2016: Exchange 2016 Network and directory servers.
- The full installation option of Windows Server 2012 and Windows Server 2012 R2 must be used for all servers running Exchange 2016 server roles or management tools.
- Some prerequisites require you to reboot the server to complete installation.

NOTE

You can't upgrade Windows from one version to another, or from Standard to Datacenter, when Exchange is installed on the server.

- Verify the Supported operating systems for Exchange 2019 or Supported operating systems for Exchange 2016.

NOTE

New to Exchange 2019 is the ability to upgrade your operating system to a newer version while Exchange is installed on Windows Server 2019 or later.

- Verify the computer is joined to the appropriate internal Active Directory domain.

- Install the latest Windows updates on your computer.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

Exchange 2019 prerequisites for preparing Active Directory

You can use any member of the Active Directory domain to prepare Active Directory for Exchange 2019.

1. The computer requires the following software:

   a. .NET Framework 4.8

   b. Visual C++ Redistributable Package for Visual Studio 2012

   > **NOTE**
   >
   > - The system requirements for the Visual C++ redistributable package do not mention support for Windows Server 2016 or Windows Server 2019, but the redistributable package is safe to install on these versions of Windows.
   > - An overview of the latest supported versions is available at: Visual C++ Redistributable versions.
   > - The Visual C++ Redistributable package is required if you're using the Exchange Setup Wizard to prepare Active Directory. If you're using unattended Setup from the command line to prepare Active Directory, this package isn't required. For more information, see Prepare Active Directory and domains.

2. Install the Remote Tools Administration Pack by running the following command in Windows PowerShell:

   ```
   Install-WindowsFeature RSAT-ADDS
   ```

> **NOTE**
>
> Using the Exchange Setup Wizard to prepare Active Directory requires the installation of the Management Tools Exchange role.

Windows Server 2019 prerequisites for Exchange 2019

The requirements to install Exchange 2019 on Windows Server 2019 computers are described in the following sections. We recommend either of the following methods to install the Windows prerequisites for Exchange 2019:

- Use the /InstallWindowsComponents switch in unattended Setup mode.
- Select the check box in the Exchange Setup Wizard to install Windows prerequisites.

When you use one of these options, you don't need to restart the computer after the Windows components have been added.

Exchange 2019 Mailbox servers on Windows Server 2019

1. Install the following software:

   a. .NET Framework 4.8

b. Visual C++ Redistributable Package for Visual Studio 2012

c. Visual C++ Redistributable Package for Visual Studio 2013

> **NOTE**
>
> - The system requirements for the Visual C++ redistributable package do not mention support for Windows Server 2016 or Windows Server 2019, but the redistributable package is safe to install on these versions of Windows.
> - An overview of the latest supported versions is available at: Visual C++ Redistributable versions

2. Add the required Lync Server or Skype for Business Server components:

   a. Install the Server Media Foundation windows feature by executing the following command in Windows PowerShell:

   ```
   Install-WindowsFeature Server-Media-Foundation
   ```

   b. Install Unified Communications Managed API 4.0. This package is available for download and in the \UCMARedist folder on the Exchange Server media.

   > **NOTE**
   >
   > When installing on Windows Server Core, you must use the installation package located in \UCMARedist on distributed media.

3. If you aren't going to use Exchange Setup to install the required Windows components (in the wizard or from the command line), run the one of the following commands in Windows PowerShell:

   - Desktop Experience:

   ```
   Install-WindowsFeature Server-Media-Foundation, NET-Framework-45-Features, RPC-over-HTTP-proxy, RSAT-Clustering, RSAT-Clustering-CmdInterface, RSAT-Clustering-Mgmt, RSAT-Clustering-PowerShell, WAS-Process-Model, Web-Asp-Net45, Web-Basic-Auth, Web-Client-Auth, Web-Digest-Auth, Web-Dir-Browsing, Web-Dyn-Compression, Web-Http-Errors, Web-Http-Logging, Web-Http-Redirect, Web-Http-Tracing, Web-ISAPI-Ext, Web-ISAPI-Filter, Web-Lgcy-Mgmt-Console, Web-Metabase, Web-Mgmt-Console, Web-Mgmt-Service, Web-Net-Ext45, Web-Request-Monitor, Web-Server, Web-Stat-Compression, Web-Static-Content, Web-Windows-Auth, Web-WMI, Windows-Identity-Foundation, RSAT-ADDS
   ```

   - Server Core:

   ```
   Install-WindowsFeature Server-Media-Foundation, NET-Framework-45-Features, RPC-over-HTTP-proxy, RSAT-Clustering, RSAT-Clustering-CmdInterface, RSAT-Clustering-PowerShell, WAS-Process-Model, Web-Asp-Net45, Web-Basic-Auth, Web-Client-Auth, Web-Digest-Auth, Web-Dir-Browsing, Web-Dyn-Compression, Web-Http-Errors, Web-Http-Logging, Web-Http-Redirect, Web-Http-Tracing, Web-ISAPI-Ext, Web-ISAPI-Filter, Web-Metabase, Web-Mgmt-Service, Web-Net-Ext45, Web-Request-Monitor, Web-Server, Web-Stat-Compression, Web-Static-Content, Web-Windows-Auth, Web-WMI, RSAT-ADDS
   ```

Exchange 2019 Edge Transport servers on Windows Server 2019

1. Install the Visual C++ Redistributable Package for Visual Studio 2012

> **NOTE**
>
> - The system requirements for the Visual C++ redistributable package do not mention support for Windows Server 2016 or Windows Server 2019, but the redistributable package is safe to install on these versions of Windows.
> - An overview of the latest supported versions is available at: Visual C++ Redistributable versions.

2. If you aren't going to use Exchange Setup to install the required Windows components (in the wizard or from the command line), run the following command in Windows PowerShell:

```
Install-WindowsFeature ADLDS
```

Windows 10 client prerequisites for the Exchange 2019 management tools

1. Install the Visual C++ Redistributable Package for Visual Studio 2012

> **NOTE**
>
> - The system requirements for the Visual C++ redistributable package do not mention support for Windows Server 2016 or Windows Server 2019, but the redistributable package is safe to install on these versions of Windows.
> - An overview of the latest supported versions is available at: Visual C++ Redistributable versions.

2. If you aren't going to use Exchange Setup to install the required Windows components (in the wizard or from the command line), run the following command in Windows PowerShell:

```
Enable-WindowsOptionalFeature -Online -FeatureName IIS-ManagementScriptingTools,IIS-ManagementScriptingTools,IIS-IIS6ManagementCompatibility,IIS-LegacySnapIn,IIS-ManagementConsole,IIS-Metabase,IIS-WebServerManagementTools,IIS-WebServerRole
```

Exchange 2016 prerequisites for preparing Active Directory

You can use any member of the Active Directory domain to prepare Active Directory for Exchange 2016.

1. The computer requires the following software:

   a. .NET Framework 4.8

   b. Visual C++ Redistributable Package for Visual Studio 2012

> **NOTE**
>
> - The system requirements for the Visual C++ redistributable package do not mention support for Windows Server 2016 or Windows Server 2019, but the redistributable package is safe to install on these versions of Windows.
> - An overview of the latest supported versions is available at: Visual C++ Redistributable versions.

2. Install the Remote Tools Administration Pack by running the following command in Windows PowerShell:

```
Install-WindowsFeature RSAT-ADDS
```

After you've installed the Remote Tools Administration Pack you can use the computer to prepare Active Directory. For more information, see Prepare Active Directory and domains.

Windows Server 2016 prerequisites for Exchange 2016

The prerequisites that are needed to install Exchange 2016 on computers running Windows Server 2016 depends on which Exchange role you want to install. Read the section below that matches the role you want to install.

> **IMPORTANT**
>
> Windows Server 2016 requires Exchange 2016 Cumulative Update 3 or later.

Exchange 2016 Mailbox servers on Windows Server 2016

1. Run the following command in Windows PowerShell to install the required Windows components:

```
Install-WindowsFeature NET-Framework-45-Features, Server-Media-Foundation, RPC-over-HTTP-proxy, RSAT-Clustering, RSAT-Clustering-CmdInterface, RSAT-Clustering-Mgmt, RSAT-Clustering-PowerShell, WAS-Process-Model, Web-Asp-Net45, Web-Basic-Auth, Web-Client-Auth, Web-Digest-Auth, Web-Dir-Browsing, Web-Dyn-Compression, Web-Http-Errors, Web-Http-Logging, Web-Http-Redirect, Web-Http-Tracing, Web-ISAPI-Ext, Web-ISAPI-Filter, Web-Lgcy-Mgmt-Console, Web-Metabase, Web-Mgmt-Console, Web-Mgmt-Service, Web-Net-Ext45, Web-Request-Monitor, Web-Server, Web-Stat-Compression, Web-Static-Content, Web-Windows-Auth, Web-WMI, Windows-Identity-Foundation, RSAT-ADDS
```

2. Install the following software in order:

a. .NET Framework 4.8

b. December 13, 2016 (KB3206632) security update

> **NOTE**
>
> You can only install this update if your Windows Server 2016 version is 14393.576 or earlier (circa December, 2016). You can check your Windows Server version by running the **winver** command. If your Windows Server 2016 version is greater than 14393.576, you don't need this update or its replacement KB3213522, which was released one week later. Exchange 2016 Setup looks for the installation of this update, won't allow you to continue if this update is missing, and will clearly inform you if you need it.

c. Visual C++ Redistributable Package for Visual Studio 2012

d. Visual C++ Redistributable Package for Visual Studio 2013

NOTE

- The system requirements for the Visual C++ redistributable package do not mention support for Windows Server 2016 or Windows Server 2019, but the redistributable package is safe to install on these versions of Windows.
- An overview of the latest supported versions is available at: Visual C++ Redistributable versions.
- Only the Mailbox role requires the Visual C++ Redistributable Packages for Visual Studio 2013. Other Exchange installations (management tools and Edge Transport) only require the Visual C++ Redistributable Packages for Visual Studio 2012.

e. Microsoft Unified Communications Managed API 4.0, Core Runtime 64-bit

Exchange 2016 Edge Transport servers on Windows Server 2016

1. Run the following command in Windows PowerShell to install the required Windows components:

```
Install-WindowsFeature ADLDS
```

2. Install the following software in order:

a. .NET Framework 4.8

b. Visual C++ Redistributable Package for Visual Studio 2012

NOTE

- The system requirements for the Visual C++ redistributable package do not mention support for Windows Server 2016 or Windows Server 2019, but the redistributable package is safe to install on these versions of Windows.
- An overview of the latest supported versions is available at: Visual C++ Redistributable versions.

Windows Server 2012 and Windows Server 2012 R2 prerequisites for Exchange 2016

The prerequisites for Exchange 2016 on Windows Server 2012 or Windows Server 2012 R2 computers depend on the Exchange role that you're installing. Read the following section that matches the role you want to install.

Exchange 2016 Mailbox servers on Windows Server 2012 or Windows Server 2012 R2

1. Run the following command in Windows Powershell to install the required Windows components:

```
Install-WindowsFeature AS-HTTP-Activation, Server-Media-Foundation, NET-Framework-45-Features, RPC-over-HTTP-proxy, RSAT-Clustering, RSAT-Clustering-CmdInterface, RSAT-Clustering-Mgmt, RSAT-Clustering-PowerShell, WAS-Process-Model, Web-Asp-Net45, Web-Basic-Auth, Web-Client-Auth, Web-Digest-Auth, Web-Dir-Browsing, Web-Dyn-Compression, Web-Http-Errors, Web-Http-Logging, Web-Http-Redirect, Web-Http-Tracing, Web-ISAPI-Ext, Web-ISAPI-Filter, Web-Lgcy-Mgmt-Console, Web-Metabase, Web-Mgmt-Console, Web-Mgmt-Service, Web-Net-Ext45, Web-Request-Monitor, Web-Server, Web-Stat-Compression, Web-Static-Content, Web-Windows-Auth, Web-WMI, Windows-Identity-Foundation, RSAT-ADDS
```

2. Install the following software in order:

a. .NET Framework 4.8

b. Visual C++ Redistributable Package for Visual Studio 2012

c. Visual C++ Redistributable Package for Visual Studio 2013

> **NOTE**
>
> - The system requirements for the Visual C++ redistributable package do not mention support for Windows Server 2016 or Windows Server 2019, but the redistributable package is safe to install on these versions of Windows.
> - An overview of the latest supported versions is available at: Visual C++ Redistributable versions.
> - Only the Mailbox role requires the Visual C++ Redistributable Packages for Visual Studio 2013. Installations of the Exchange management tools and Edge Transport servers only require the Visual C++ Redistributable Packages for Visual Studio 2012.

d. Microsoft Unified Communications Managed API 4.0, Core Runtime 64-bit

Exchange 2016 Edge Transport servers on Windows Server 2012 or Windows Server 2012 R2

1. Run the following command in Windows PowerShell to install the required Windows components:

```
Install-WindowsFeature ADLDS
```

2. Install the following software in order:

a. .NET Framework 4.8

b. Visual C++ Redistributable Package for Visual Studio 2012

> **NOTE**
>
> - The system requirements for the Visual C++ redistributable package do not mention support for Windows Server 2016 or Windows Server 2019, but the redistributable package is safe to install on these versions of Windows.
> - An overview of the latest supported versions is available at: Visual C++ Redistributable versions.

Windows client prerequisites for the Exchange 2016 management tools

Exchange 2016 management tools on Windows 10

1. Install Visual C++ Redistributable Package for Visual Studio 2012

> **NOTE**
>
> - The system requirements for the Visual C++ redistributable package do not mention support for Windows Server 2016 or Windows Server 2019, but the redistributable package is safe to install on these versions of Windows.
> - An overview of the latest supported versions is available at: Visual C++ Redistributable versions.

2. Run the following command in an elevated Windows PowerShell window (a Windows PowerShell window you open by selecting `Run as administrator`):

```
Enable-WindowsOptionalFeature -Online -FeatureName IIS-ManagementScriptingTools,IIS-
ManagementScriptingTools,IIS-IIS6ManagementCompatibility,IIS-LegacySnapIn,IIS-ManagementConsole,IIS-
Metabase,IIS-WebServerManagementTools,IIS-WebServerRole
```

Exchange 2016 management tools on Windows 8.1

1. Install .NET Framework 4.8

2. Install Visual C++ Redistributable Package for Visual Studio 2012

> **NOTE**
>
> - The system requirements for the Visual C++ redistributable package do not mention support for Windows Server 2016 or Windows Server 2019, but the redistributable package is safe to install on these versions of Windows.
>
> - An overview of the latest supported versions is available at: Visual C++ Redistributable versions.

3. Run the following command in an elevated Windows PowerShell window (a Windows PowerShell window you open by selecting **Run as administrator**):

```
Enable-WindowsOptionalFeature -Online -FeatureName IIS-ManagementScriptingTools,IIS-
ManagementScriptingTools,IIS-IIS6ManagementCompatibility,IIS-LegacySnapIn,IIS-ManagementConsole,IIS-
Metabase,IIS-WebServerManagementTools,IIS-WebServerRole
```

Install Office Online Server in an Exchange organization

8/3/2020 • 5 minutes to read • Edit Online

An optional prerequisite for Exchange 2016 Cumulative Update 1 (CU1) or later, as well as for Exchange 2019, is the installation of Office Online Server on one or more servers in your organization. Office Online Server enables users to view supported file attachments within Outlook on the web (formerly known as Outlook Web App) without downloading them first and without having a local installation of the program. Without Office Online Server installed, Outlook users need to download attachments to their local computer and then open them in a local application.

> **NOTE**
> Office Online Server is available for download as part of a volume licensing agreement. If you don't have a volume license agreement, you can skip the instructions in this step. However, without Office Online Server installed, Outlook users will need to download attachments to their local computer to view them; they won't be able to view them in Outlook.

You can configure an Office Online Server endpoint in two places in Exchange 2016 and later: at the organization level, and at the Mailbox server level. Where you configure the endpoint depends on the size of your organization and the location of your servers and users.

- **Organization**: There are a couple of reasons why you might configure the Office Online Server endpoint at the organization level:

  - **Single-server or single-location deployment**: You can configure the endpoint at the organization level if all of your Exchange 2016 Mailbox servers are in the same location and you don't plan on having geographically distributed Office Online Server servers.

  - **Fallback for large deployments**: You can configure endpoint at the organization level as a fallback if the endpoint configured on a Mailbox server isn't available. If an Office Web Apps server isn't available, the client will try to connect to the endpoint configured at the organization level.

    Notes:

    - If you have Exchange 2013 servers in your organization, don't configure an endpoint at the organization level. Doing so will direct Exchange 2013 servers to use the Office Online Server server. This isn't supported.

    - Previewing attachments in S/MIME messages in Outlook on the web isn't supported by Office Online Server.

- **Mailbox server**: If you want to distribute client requests between two or more Office Online Server servers, if you want to geographically distribute Office Online Server servers, or if you have Exchange 2013 in your organization, configure the endpoints at the Exchange Mailbox server level. When you configure an endpoint at the server level, mailboxes located on that server will send requests to the configured Office Online Server server.

If you want users outside of your network to view supported file attachments in Outlook, Office Online Server needs to be accessible from the Internet. TCP port 443 needs to be opened on your firewall and forwarded to the Office Online Server server. If you deploy more than one Office Online Server server, each server needs its own fully qualified domain name (FQDN). Each server also needs to be accessible from the Internet via TCP port 443.

Office Online Server system requirements

To set up Office Online Server, you will need the following:

- Windows Server 2012 R2 or Windows Server 2016
- Exchange 2016 Cumulative Update 1 (CU1) or later, or Exchange 2019

  > **NOTE**
  >
  > If you're running Windows Server 2016, you will need Exchange 2016 CU3 or later, as detailed in Exchange Server prerequisites.

- Microsoft .NET Framework 4.5.2
- Visual C++ Redistributable for Visual Studio 2015
- Visual C++ Redistributable Packages for Visual Studio 2013
- Microsoft.IdentityModel.Extention.dll
- All available Windows updates installed

> **NOTE**
>
> Office Online Server can't be installed on an Exchange server, SharePoint server, Active Directory domain controller, or any other computer with existing applications installed.

Install Office Online Server

1. To install Office Online Server, follow Steps 1 through 3 in the section **Prepare servers to run Office Online Server** of the article Deploy Office Online Server before proceeding.

2. Obtain and import an SSL certificate with the fully qualified domain name(s) (FQDN) of the Office Online Server server. If your organization is configured for split DNS, you only need to configure one FQDN on the certificate. For example, oos.contoso.com. If you have different internal and external FQDNs, you'll need to configure both FQDNs on the certificate. For example, oos.internal.contoso.com and oos.contoso.com.

3. Configure DNS records to point the FQDN(s) on the certificate to your Office Online Serverserver. If you have different DNS servers for internal and external users, you'll need to configure the appropriate FQDN on each server.

4. Open Windows PowerShell and run the following commands. When you run the commands, replace the example FQDNs and certificate friendly name with your own.

   ```
   New-OfficeWebAppsFarm -InternalURL "https://oos.contoso.com" -ExternalURL "https://oos.contoso.com" -
   CertificateName "Office Online Server Preview Certificate"`
   ```

   > **NOTE**
   >
   > You can configure different internal and external URLs, but in the next step you'll see that you can only configure one URL for Exchange. In this case, if you use the internal URL in the next step, this function will only work internally and external users will get an unexpected error. If you use the external URL, this function will only work for external users and internal users will get an unexpected error.

Configure the Office Online Server endpoint at the Mailbox server level

After you've configured the Office Online Server server, do the following on your Exchange 2016 server. This will allow Outlook to send requests to the Office Online Server server.

1. Open the Exchange Management Shell and run the following command. Replace the example server name and URL with your own.

   ```
   Set-MailboxServer MBX -WacDiscoveryEndpoint "https://oos.contoso.com/hosting/discovery"
   ```

2. Restart the MsExchangeOwaAppPool by running the following command.

   ```
   Restart-WebAppPool MsExchangeOwaAppPool
   ```

Configure the Office Online Server endpoint at the organization level

After you've configured the Office Online Server server, do the following on your Exchange 2016 server. This will allow Outlook to send requests to the Office Online Server server.

1. Open the Exchange Management Shell and run the following command. Replace the example URL with your own.

   ```
   Set-OrganizationConfig -WacDiscoveryEndpoint "https://oos.internal.contoso.com/hosting/discovery"
   ```

   > **IMPORTANT**
   >
   > If you have Exchange 2013 servers in your organization, don't configure an endpoint at the organization level. Doing so will direct Exchange 2013 servers to use the Office Online Server server. This isn't supported.

2. Restart the MsExchangeOwaAppPool by running the following command.

   ```
   Restart-WebAppPool MsExchangeOwaAppPool
   ```

Active Directory in Exchange Server organizations

8/3/2020 • 2 minutes to read • Edit Online

Exchange Server 2016 and Exchange Server 2019 use Active Directory to store and share directory information with Windows. Starting with Exchange 2013, we've made some changes to how Exchange works with Active Directory. These changes are described in this topic.

Active Directory driver

The Active Directory driver is the core Microsoft Exchange component that allows Exchange services to create, modify, delete, and query for Active Directory Domain Services (AD DS) data. In Exchange 2013 and later, all access to Active Directory is done using the Active Directory driver itself. In previous versions of Exchange, DSAccess provided directory lookup services for components such as SMTP, message transfer agent (MTA), and the Exchange store.

The Active Directory driver also uses the Microsoft Exchange Active Directory Topology (MSExchangeADTopology) server, which allows the Active Directory driver to use Directory Service Access (DSAccess) topology data. This data includes the list of available domain controllers and global catalog servers that are available to handle Exchange requests. For more information about the Active Directory Driver, see Active Directory Domain Services.

Active Directory schema changes

Exchange add new attributes to the Active Directory domain service schema and also make other modifications to existing classes and attributes. For more information about Active Directory changes when you install Exchange, see Active Directory schema changes in Exchange Server.

For more information

To learn more about how Exchange stores and retrieves information in Active Directory so that you can plan for access to it, see Access to Active Directory in Exchange Server.

For more information about Active Directory forest design, see AD DS Design Guide.

To learn more about computers running Windows in an Active Directory domain and deploying Exchange 2013 or later in a domain that has a disjoint namespace, see Disjoint Namespace Scenarios.

Access to Active Directory by Exchange servers

8/3/2020 • 5 minutes to read • Edit Online

Exchange Server 2016 and Exchange Server 2019 store all configuration and recipient information in the Active Directory directory service database. When an Exchange server requires information about recipients the configuration of the Exchange organization, it queries Active Directory. Active Directory servers must be available for Exchange to function correctly.

This topic explains how Exchange stores and retrieves information in Active Directory so that you can plan access to Active Directory. This topic also discusses issues you should be aware of if you try to recover deleted Exchange Active Directory objects.

Exchange information stored in Active Directory

The Active Directory database stores information in three types of logical partitions that are described in the following sections:

- Schema partition
- Configuration partition
- Domain partition

Schema partition

The schema partition stores the following two types of information:

- **Schema classes** define all the types of objects that can be created and stored in Active Directory.
- **Schema attributes** define all the properties that can be used to describe the objects that are stored in Active Directory.

When you install the first Exchange server in the forest (or run the Active Directory preparation process), the Active Directory preparation process adds many classes and attributes to the Active Directory schema. The classes that are added to the schema are used to create Exchange-specific objects (for example, agents and connectors). These attributes are used to configure the Exchange-specific objects and the mail-enabled users and groups. These attributes include properties, such as Outlook on the web (formerly known as Outlook Web App) settings.

Every domain controller and global catalog server in the forest contains a complete replica of the schema partition.

For more information about schema modifications in Exchange, see Active Directory schema changes in Exchange Server.

Configuration partition

The configuration partition stores information about the forest-wide configuration. This configuration information includes the configuration of Active Directory sites, Exchange global settings, transport settings, and mailbox policies. Each type of configuration information is stored in a container in the configuration partition. Exchange configuration information is stored in a subfolder under the configuration partition's Services container. The type of information that's stored in this container includes:

- Address lists
- Address book mailbox policies
- Administrative groups

- Client Access settings
- Connections
- Mobile mailbox Settings
- Global settings
- Monitoring Settings
- System policies
- Retention policies container
- Transport settings

Every domain controller and global catalog server in the forest contains a complete replica of the configuration partition.

Domain partition

The domain partition stores information in default containers and in organizational units that are created by the Active Directory administrator. These containers hold the domain-specific objects. This data includes Exchange system objects and information about the computers, users, and groups in that domain. When Exchange is installed, Exchange updates the objects in this partition to support Exchange functionality. This functionality affects how recipient information is stored and accessed.

Each domain controller contains a complete replica of the domain partition for the domain for which it is authoritative. Every global catalog server in the forest contains a subset of the information in every domain partition in the forest.

How Exchange accesses information in Active Directory

Exchange uses an Active Directory API to access information that's stored in Active Directory. This service reads information from all Active Directory partitions. The data that is retrieved is cached and is used by Exchange servers to discover the Active Directory site location of all Exchange services in the organization.

For more information about topology and service discovery in Exchange 2013 or later, see Planning to use Active Directory sites for routing Mail.

Exchange is an Active Directory site-aware application that prefers to communicate with the directory servers that are located in the same site as the Exchange server to optimize network traffic. Each Exchange server must communicate with Active Directory to retrieve information about recipients and information about the other Exchange servers. Mailbox servers store configuration information about mailbox users and mailbox stores in Active Directory. Additionally, the Mailbox server stores information in Active Directory for the Client Access protocols, Transport service, Mailbox databases, and so on. The Mailbox server handles all activity for the active mailboxes on that server.

By default, whenever an Exchange server starts, it binds to a randomly selected domain controller and global catalog server in its own site. You can view the selected directory servers by using the **Get-ExchangeServer** cmdlet in the Exchange Management Shell. You can also use the **Set-ExchangeServer** cmdlet to configure a static list of domain controllers that an Exchange 2016 server should bind to or a list of domain controllers that should be excluded.

> **IMPORTANT**
>
> You can't deploy an Exchange server in any site that contains only read-only directory servers.

Recovery of deleted Exchange objects

Active Directory Recycle Bin helps minimize directory service downtime by enhancing your ability to preserve and recover accidentally deleted Active Directory objects without restoring Active Directory data from backups, restarting Active Directory Domain Services (AD DS), or rebooting domain controllers.

The most important thing to understand about recovering deleted Exchange-related Active Directory objects is that Exchange objects don't exist in isolation. For example, when you mail-enable a user, several different policies and links are calculated for the user based on your current Exchange configuration. Two problems that may arise when you restore a deleted Exchange configuration or recipient object are:

- **Collisions**: Some Exchange attributes must be unique across a forest. For example, all email addresses on a mail-enabled object (also known as proxy addresses) must be unique. Two different mail-enabled objects can't have the same email address. Active Directory doesn't enforce proxy address uniqueness (Exchange administrative tools check for uniqueness). Exchange email address policies also automatically resolve possible conflicts in proxy address assignment based on deterministic rules. Therefore, restoring an Exchange user object might create a collision with proxy addresses or other attributes that should be unique.

- **Misconfigurations**: Exchange has automated rules that assign various policies or settings. If you delete a recipient, and then change the rules or policies, restoring an Exchange user object may result in a user being assigned to the wrong policy (or even to a policy that no longer exists).

The following guidelines will help you minimize problems or issues when you recover deleted Exchange-related objects:

- If you deleted an Exchange configuration object using Exchange management tools, don't restore the object. Instead, create the object again using the Exchange management tools (the Exchange admin center or the Exchange Management Shell).

- If you deleted an Exchange configuration object without using the Exchange management tools, recover the object as soon as possible. The more administrative and configuration changes that are mae after the deletion, the more likely that restoring the objects will result in misconfiguration.

- If you recover deleted Exchange recipients (contacts, users, or distribution groups), monitor closely for collisions and errors relating to the recovered objects. If Exchange policies or other recipient configuration settings were modified after the deletion, re-apply the current policies to the restored recipients to ensure that they're configured correctly.

Active Directory schema changes in Exchange Server

8/3/2020 • 25 minutes to read • Edit Online

This reference topic provides a summary of the Active Directory schema changes that are made when you install Exchange Server 2016 or Exchange Server 2019 in your organization. Refer to the .ldf files for more information about changes to the Active Directory schema. The .ldf files are located in the \Setup\Data\ directory in the Exchange installation files.

Exchange schema updates are cumulative. Each Cumulative Update (CU) includes all of the changes that were included in previous releases. This means that if you skip a CU, you might still need to apply schema updates even if the CU that you're installing doesn't include its own changes.

> **NOTE**
>
> The Active Directory schema changes that are described in this topic might not apply to all editions of an Exchange 2019 version. To verify that Active Directory has been successfully prepared, see the Exchange Active Directory versions section in Prepare Active Directory and domains for Exchange 2019.

Exchange 2019 CU6 Active Directory schema changes

No changes are made to the Active Directory schema in Exchange 2019 CU6.

Exchange 2019 CU5 Active Directory schema changes

No changes are made to the Active Directory schema in Exchange 2019 CU5.

Exchange 2019 CU4 Active Directory schema changes

No changes are made to the Active Directory schema in Exchange 2019 CU4.

Exchange 2019 CU3 Active Directory schema changes

No changes are made to the Active Directory schema in Exchange 2019 CU3.

Exchange 2019 CU2 Active Directory schema changes

No changes are made to the Active Directory schema in Exchange 2019 CU2.

Exchange 2019 CU1 Active Directory schema changes

No changes are made to the Active Directory schema in Exchange 2019 CU1.

However, a reduction in Active Directory permissions is made: The AdminSDHolder object on the domain is updated to remove the "Allow" ACE that grants the "Exchange Trusted Subsystem" group the "Write DACL" right on the "Group" inherited object types. For more information, see KB 4490059.

Exchange 2019 RTM Active Directory schema changes

This section summarizes the changes that are made to the Active Directory schema when you install Exchange 2019 RTM. This section includes the following subsections:

- Classes added by Exchange 2019 RTM
- Classes modified by Exchange 2019 RTM
- Attributes added by Exchange 2019 RTM
- Global catalog attributes added by Exchange 2019 RTM
- Attributes modified by Exchange 2019 RTM
- Object IDs added by Exchange 2019 RTM
- Indexed attributes added by Exchange 2019 RTM
- Property sets modified by Exchange 2019 RTM
- MAPI IDs added by Exchange 2019 RTM
- Extended rights added by Exchange 2019 RTM

> **NOTE**
>
> No changes to the Active Directory schema were made between Exchange 2019 Preview and Exchange 2019 RTM.

CURRENT EXCHANGE 2016 RELEASE INSTALLED	NEW EXCHANGE 2016 RELEASE BEING INSTALLED	ARE SCHEMA UPDATES REQUIRED?
Release to Manufacturing	Cumulative Update 4 through Cumulative Update 6	**Yes**, schema updates are required. You need to apply the CU1, CU2 and CU3 schema updates.
Cumulative Update 2	Cumulative Update 4 through Cumulative Update 6	**Yes**, schema updates are required. You need to apply the CU3 schema updates.
Cumulative Update 3	Cumulative Update 4 through Cumulative Update 6	**No**, no schema updates are required. No schema changes are made in CU4 through CU6.
Cumulative Update 6	Cumulative Update 7 through Cumulative Update 14	**Yes**, schema updates are required. You need to apply the CU14 schema updates.
Cumulative Update 7 or higher	Cumulative Update 8 through Cumulative Update 17	**No**, no schema updates are required. No schema changes are made in CU8 through CU17.

NOTE

The Active Directory schema changes that are described in this topic might not apply to all editions of an Exchange 2016 version. To verify that Active Directory has been successfully prepared, see the Exchange Active Directory versions section in Prepare Active Directory and domains for Exchange Server.

Exchange 2016 CU17 Active Directory schema changes

No changes are made to the Active Directory schema in Exchange 2016 in CU17.

Exchange 2016 CU16 Active Directory schema changes

No changes are made to the Active Directory schema in Exchange 2016 in CU16.

Exchange 2016 CU15 Active Directory schema changes

No changes are made to the Active Directory schema in Exchange 2016 in CU15.

Exchange 2016 CU14 Active Directory schema changes

No changes are made to the Active Directory schema in Exchange 2016 in CU14.

Exchange 2016 CU13 Active Directory schema changes

No changes are made to the Active Directory schema in Exchange 2016 in CU13.

Exchange 2016 CU12 Active Directory schema changes

No changes are made to the Active Directory schema in Exchange 2016 in CU12.

However, a reduction in Active Directory permissions is made: The AdminSDHolder object on the domain is updated to remove the "Allow" ACE that grants the "Exchange Trusted Subsystem" group the "Write DACL" right on the "Group" inherited object types. For more information, see KB 4490059.

Exchange 2016 CU11 Active Directory schema changes

No changes are made to the Active Directory schema in Exchange 2016 in CU11.

Exchange 2016 CU10 Active Directory schema changes

No changes are made to the Active Directory schema in Exchange 2016 in CU10.

Exchange 2016 CU9 Active Directory schema changes

No changes are made to the Active Directory schema in Exchange 2016 in CU9.

Exchange 2016 CU8 Active Directory schema changes

No changes are made to the Active Directory schema in Exchange 2016 in CU8.

Exchange 2016 CU7 Active Directory schema changes

This section summarizes the changes that are made to the Active Directory schema when you install Exchange 2016 CU7. This section includes the following subsections:

- Classes added by Exchange 2016 CU7
- Classes modified by Exchange 2016 CU7
- Attributes added by Exchange 2016 CU7
- Attributes modified by Exchange 2016 CU7
- Object IDs added by Exchange 2016 CU7

Classes added by Exchange 2016 CU7

What changes in Active Directory when Exchange is installed?

8/3/2020 • 5 minutes to read • Edit Online

When you install Exchange Server 2016 or Exchange Server 2019, changes are made to your Active Directory forest and domains to store information about the Exchange servers, mailboxes, and other Exchange-related objects in your organization.

Three steps are required to prepare Active Directory for Exchange:

1. Extend the Active Directory schema

2. Prepare Active Directory containers, objects, and other items

3. Prepare Active Directory domains

After all three steps are done, your Active Directory forest is ready for Exchange. This topic explains what Exchange does at each step of Active Directory preparation.

You can make these changes before you install the first Exchange 2016 or Exchange 2019 server in the organization by running the */PrepareSchema*, */PrepareAD*, and */PrepareAllDomains* or */PrepareDomains* commands using Exchange command line Setup. For instructions, see Prepare Active Directory and domains for Exchange. Or, these changes are automatically made for you during the installation of the first Exchange server using the Exchange Setup wizard. For instructions, see Install Exchange Mailbox servers using the Setup wizard.

Extend the Active Directory schema

Extending the Active Directory schema adds and updates classes, attributes, and other items. These changes are needed so that Exchange can create containers and objects to store information about the Exchange organization. Because Exchange makes a lot of changes to the Active Directory schema, there's a topic dedicated to this step. To see all of the changes made to the schema, see Active Directory schema changes in Exchange Server.

After the schema has been extended by running the */PrepareSchema* command, the _/PrepareAD command, or installing the first Exchange server using the Exchange Setup wizard, the schema version is set in the `ms-Exch-Schema-Version-Pt` attribute. To verify that the Active Directory schema was extended successfully, you can check the value stored in this attribute. For more information, see Exchange Active Directory versions.

Prepare Active Directory containers, objects, and other items

With the schema extended, the next step is to add all of the containers, objects, attributes, and other items that Exchange uses to store information in Active Directory. Most of the changes made in this step are applied to the entire Active Directory forest. A smaller set of changes are made only to the local Active Directory domain where the */PrepareAD* command was run (or where the first Exchange server was installed using the Exchange Setup wizard).

Exchange makes the following changes to the Active Directory forest:

- The Microsoft Exchange container is created under CN=Services,CN=Configuration,DC=<*root domain*> if it doesn't already exist.

- The following containers and objects are created under CN=<*organization name*>,CN=Microsoft Exchange,CN=Services,CN=Configuration,DC=<*root domain*> if they don't already exist:

- CN=Address Lists Container
- CN=AddressBook Mailbox Policies
- CN=Addressing
- CN=Administrative Groups
- CN=Approval Applications
- CN=Auth Configuration
- CN=Availability Configuration
- CN=Client Access
- CN=Connections
- CN=ELC Folders Container
- CN=ELC Mailbox Policies
- CN=ExchangeAssistance
- CN=Federation
- CN=Federation Trusts
- CN=Global Settings
- CN=Hybrid Configuration
- CN=Mobile Mailbox Policies
- CN=Mobile Mailbox Settings
- CN=Monitoring Settings
- CN=OWA Mailbox Policies
- CN=Provisioning Policy Container
- CN=Push Notification Settings
- CN=RBAC
- CN=Recipient Policies
- CN=Remote Accounts Policies Container
- CN=Retention Policies Container
- CN=Retention Policy Tag Container
- CN=ServiceEndpoints
- CN=System Policies
- CN=Team Mailbox Provisioning Policies
- CN=Transport Settings
- CN=UM AutoAttendant Container (Exchange 2016 only)
- CN=UM DialPlan Container (Exchange 2016 only)

  - CN=UM IPGateway Container (Exchange 2016 only)
  - CN=UM Mailbox Policies (Exchange 2016 only)
  - CN=Workload Management Settings
- The following containers and objects are created under CN=Transport Settings,CN=<*Organization Name*>,CN=Microsoft Exchange,CN=Services,CN=Configuration,DC=<*root domain*> if they don't already exist:
  - CN=Accepted Domains
  - CN=ControlPoint Config
  - CN=DNS Customization
  - CN=Interceptor Rules
  - CN=Malware Filter
  - CN=Message Classifications
  - CN=Message Hygiene
  - CN=Rules
  - CN=MicrosoftExchange329e71ec88ae4615bbc36ab6ce41109e
- Permissions are set throughout the configuration partition in Active Directory.
- The Rights.ldf file is imported. This file adds permissions that are needed to install Exchange and configure Active Directory.
- The Microsoft Exchange Security Groups organizational unit (OU) is created in the root domain of the forest, and permissions are assigned to it.
- The following groups are created within the Microsoft Exchange Security Groups OU if they don't already exist:
  - Compliance Management
  - Delegated Setup
  - Discovery Management
  - Exchange Servers
  - Exchange Trusted Subsystem
  - Exchange Windows Permissions
  - ExchangeLegacyInterop
  - Help Desk
  - Hygiene Management
  - Managed Availability Servers
  - Organization Management
  - Public Folder Management
  - Recipient Management

  - Records Management
  - Server Management
  - View-Only Organization Management

- The new management role groups (which appear as universal security groups (USGs) in Active Directory) that were created in the Microsoft Exchange Security Groups OU are added to the **otherWellKnownObjects** attribute stored on the CN=Microsoft Exchange,CN=Services,CN=Configuration,DC=<*root domain*> container.
- In Exchange 2016 only, the Unified Messaging Voice Originator contact is created in the Microsoft Exchange System Objects container of the root domain.
- Only the domain where the */PrepareAD* command was run (or where the first Exchange server was installed using the Exchange Setup wizard) is prepared for Exchange. For information about what's done to prepare an Active Directory domain for Exchange, see the next section.

Prepare Active Directory domains

The final step of preparing Active Directory for Exchange is to prepare the Active Directory domains where Exchange servers will be installed or where mailbox-enabled users will be located (all domains in the forest using the */PrepareAllDomains* command, specific domains using the */PrepareDomains* command, or installing the first Exhange server using the Exchange Setup Wizard). This step is done automatically in the domain where the *PrepareAD* command was run (or where the first Exchange server was installed using the Exchange Setup wizard).

Exchange makes the follwing changes to the Active Directory domains:

- The Microsoft Exchange System Objects container is created in the root domain partition in Active Directory if it doesn't already exist.
- Permissions are set on the Microsoft Exchange System Objects container for the Exchange Servers, Organization Management, and Authenticated Users security groups.
- Modifying the **Default Domain Controllers GPO** to grant "Manage Auditing and Security Log policy" rights to **Exchange Enterprise Servers**.
- The Exchange Install Domain Servers domain global group is created in the current domain and placed in the Microsoft Exchange System Objects container.
- The Exchange Install Domain Servers group is added to the Exchange Servers USG in the root domain.
- Permissions are assigned at the domain level for the Exchange Servers USG and the Organization Management USG.
- The **objectVersion** property in the Microsoft Exchange System Objects container under DC=<*root domain*> is set. To verify that the Active Directory domains were successfully prepared, you can check the value stored in this attribute. For more information, see Exchange Active Directory versions.

Prepare Active Directory and domains for Exchange Server

8/3/2020 • 10 minutes to read • Edit Online

Exchange uses Active Directory to store information about mailboxes and the configuration of Exchange servers in the organization. Before you install Exchange Server 2016 or Exchange Server 2019 (even if you have earlier versions of Exchange installed in your organization), you need to prepare your Active Directory forest and its domains for the new version of Exchange. There are two ways to do this:

- **Let the Exchange Setup wizard do it for you**: If you don't have a large Active Directory deployment, and you don't have a separate team that manages Active Directory, we recommend using the Setup wizard. Your account needs to be a member of both the Schema Admins and Enterprise Admins security groups. For more information about how to use the Setup wizard, check out Install Exchange Mailbox servers using the Setup wizard.

- **Follow the steps in this topic**: If you have a large Active Directory deployment, or if a separate team manages Active Directory, this topic is for you. Following the steps in this topic gives you much more control over each stage of preparation, and who can do each step. For example, Exchange administrators might not have the required permissions to extend the Active Directory schema.

For details on new schema classes and attributes that Exchange adds to Active Directory, including those made by Cumulative Updates (CUs), see Active Directory schema changes in Exchange Server.

For details about what's happening when Active Directory is being prepared for Exchange, see What changes in Active Directory when Exchange is installed?.

If you aren't familiar with Active Directory forests or domains, check out Active Directory Domain Services Overview.

What do you need to know before you begin?

- Estimated time to complete: 10-15 minutes or more (not including Active Directory replication), depending on organization size and the number of child domains.

- The computer that you use for these procedures needs to meet the system requirements for Exchange.

- Verify that your Active Directory meets the requirements for Exchange:

  - **Exchange 2019**: Exchange 2019 Network and directory servers.

  - **Exchange 2016**: Exchange 2016 Network and directory servers.

- If your organization has multiple Active Directory domains, we recommend the following approach:

  - Do these procedures in an Active Directory site that contains an Active Directory server from every domain.

  - Install the first Exchange server in an Active Directory site that contains a writeable global catalog server from every domain.

- The computer that you use for all procedures in this topic requires access to Setup.exe in the Exchange installation files:

  1. Download the latest version of Exchange. For more information, see Updates for Exchange Server.

2. In File Explorer, right-click on the Exchange ISO image file that you downloaded, and then select **Mount**. Note the virtual DVD drive letter that's assigned.

3. Open a Windows Command Prompt window. For example:

   - Press the Windows key + 'R' to open the **Run** dialog, type cmd.exe, and then press **OK**.

   - Press **Start**. In the **Search** box, type **Command Prompt**, then in the list of results, select **Command Prompt**.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

Step 1: Extend the Active Directory schema

> **TIP**
>
> If you don't have a separate team that manages your Active Directory schema, you can skip this step and go directly to Step 2: Prepare Active Directory. If you don't extend the schema in this step, the */PrepareAd* command in Step 2 will automatically extend the schema for you. If you skip this step, the requirements will also apply to Step 2.

When you extend the Active Directory schema for Exchange, the following requirements apply:

- Your account needs to be a member of the Schema Admins and Enterprise Admins security groups. If you have multiple Active Directory forests, make sure you're logged into the right one.

- The computer needs to be a member of the same Active Directory domain and site as the schema master.

- If you use the */DomainController:<DomainControllerFQDN>* switch, you need to specify the domain controller that's the schema master.

- The only supported way to extend the schema for Exchange is to use Setup.exe with */PrepareSchema*, */PrepareAD*, or the Exchange Setup wizard. Other ways of extending the schema aren't supported.

To extend the schema for Exchange, run the following command in a Windows Command Prompt window:

```
<Virtual DVD drive letter>:\Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareSchema
```

For example, if the Exchange installation files are available on drive E:, run the following command:

```
E:\Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareSchema
```

> **NOTE**
>
> When you run this command, a prerequisite check is performed that will tell you which requirements are missing.

After Setup finishes extending the schema, you'll need to wait while Active Directory replicates the changes to all of your domain controllers before you proceed. To check the progress of the replication, you can use the `repadmin` tool in Windows Server. For more information about how to use the `repadmin` tool, see Repadmin.

Step 2: Prepare Active Directory

After the Active Directory schema has been extended, you can prepare other parts of Active Directory for Exchange. During this step, Exchange will create containers, objects, and other items in Active Directory to store information. The collection of the Exchange containers, objects, attributes, and so on, is called the *Exchange organization*.

When you prepare Active Directory for Exchange, the following requirements apply:

- Your account needs to be a member of the Enterprise Admins security group. If you skipped Step 1 because you want the */PrepareAD* command to extend the schema, the account also needs to be a member of the Schema Admins security group.
- The computer needs to be a member of the same Active Directory domain and site as the schema master, and must be able to contact all of the domains in the forest on TCP port 389.
- Wait until Active Directory has finished replicating the schema changes from Step 1 to all domain controllers before you try to prepare Active Directory.
- You need to select a name for the Exchange organization. The organization name is used internally by Exchange, isn't typically seen by users, doesn't affect the functionality of Exchange, and doesn't determine what you can use for email addresses.
    - The organization name can't contain more than 64 characters, and can't be blank.
    - Valid characters are A to Z, a to z, 0 to 9, hyphen or dash (-), and space, but leading or trailing spaces aren't allowed.
    - You can't change the organization name after it's set.

To prepare Active Directory for Exchange, run the following command in a Windows Command Prompt window:

```
<Virtual DVD drive letter>:\Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareAD  /OrganizationName:"
<Organization name>"
```

This example uses the Exchange installation files on drive E: and names the Exchange organization "Contoso Corporation".

```
E:\Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareAD /OrganizationName:"Contoso Corporation"
```

IMPORTANT

If you have a hybrid deployment configured between your on-premises organization and Exchange Online, add the */TenantOrganizationConfig* switch to the command.

As in Step 1, you'll need to wait while Active Directory replicates the changes from this step to all of your domain controllers before you proceed, and you can use the `repadmin` tool to check the progress of the replication.

Step 3: Prepare Active Directory domains

TIP

If you have only one domain, you can skip this step because the */PrepareAD* command in Step 2 has already prepared the domain for you.

The final step is to prepare the Active Directory domain where Exchange servers will be installed or where mail-enabled users will be located. This step creates additional containers and security groups, and sets the permissions so Exchange can access them.

If you have multiple domains in your Active Directory forest, you have the following choices in how to prepare them:

- Prepare all domains in the Active Directory forest
- Choose the Active Directory domains to prepare

Regardless of the method you choose, wait until Active Directory has finished replicating the changes from Step 2 to all domain controllers before you proceed. Otherwise, you might get an error when you try to prepare the domains.

Prepare all domains in the Active Directory forest

When you prepare all domains in the Active Directory forest for Exchange, your account needs to be a member of the Enterprise Admins security group.

To prepare all domains in your Active Directory forest, run the following command in a Windows Command Prompt window:

```
<Virtual DVD drive letter>:\Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareAllDomains
```

For example, if the Exchange installation files are available on drive E:, run the following command:

```
E:\Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareAllDomains
```

Choose the Active Directory domains to prepare

> **TIP**
> You don't need to do this step in the domain where you ran the */PrepareAD* command in Step 2, because the */PrepareAD* command has automatically prepared that domain for you.

When you prepare specific domains in your Active Directory forest, the following requirements apply:

- You need to prepare every domain where an Exchange server will be installed.
- You need to prepare any domain that will contain mail-enabled users, even if the domain won't contain any Exchange servers.
- Your account needs to be a member of the Domain Admins group in the domain that you want to prepare.
- If the domain that you want to prepare was created **after** you ran /PrepareAD in Step 2, your account also needs to be a member of the Organization Management role group in Exchange.

To a prepare a specific domain in your Active Directory forest, run the following command in a Windows Command Prompt window:

```
<Virtual DVD drive letter>:\Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareDomain[:<DomainFQDN>]
```

Notes:

- If the computer is a member of the domain that you want to prepare, you can use the */PrepareDomain* switch by itself. Otherwise, you need to specify the FQDN of the domain.

- You need to run this command for each Active Directory domain where you'll install an Exchange server or where mail-enabled users will be located.

This example uses the Exchange installation files on drive E: to prepare the engineering.corp.contoso.com domain:

```
E:\Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareDomain:engineering.corp.contoso.com
```

This is the same example, but run on a computer that's a member of the engineering.corp.contoso.com domain:

```
E:\Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareDomain
```

How do you know this worked?

To verify that you successfully prepared Active Directory and domains for Exchange, use any of the following steps:

- Use ADSI Edit and the information from the tables in the next section to verify that the specified objects have the correct values for the release of Exchange that you're installing. To learn more about ADSI Edit, see ADSI Edit (adsiedit.msc).

Caution

Never change values in ADSI Edit unless you're told to do so by Microsoft Customer Service and Support. Changing values in ADSI Edit can cause irreparable damage to your Exchange organization and Active Directory.

- Check the Exchange setup log to verify that Active Directory preparation has completed successfully. For more information, see Verify an Exchange installation. Note that you can't use the **Get-ExchangeServer** cmdlet as described in the topic until you've completed the installation of at least one Exchange Mailbox server in an Active Directory site.

Exchange Active Directory versions

The tables in the following sections contain the Exchange objects in Active Directory that are updated each time you install a new version of Exchange (a new installation or a CU). You can compare the object versions you see with the values in the tables to verify that Exchange successfully updated Active Directory during the installation.

- **rangeUpper** is located in the **Schema** naming context in the properties of the **ms-Exch-Schema-Version-Pt** container.
- **objectVersion (Default)** is the **objectVersion** attribute located in the **Default naming context** in the properties of the **Microsoft Exchange System Objects** container.
- **objectVersion (Configuration)** is the **objectVersion** attribute located in the **Configuration** naming context in **Services** > **Microsoft Exchange** in the properties of the **<Your Exchange Organization Name>** container.

Exchange 2019 Active Directory versions

Deploy new installations of Exchange

8/3/2020 • 2 minutes to read • Edit Online

Before you begin your installation of Exchange Server, see Planning and deployment for important planning information, and information about system requirements and prerequisites.

The following topics provide information about deploying new installations of Exchange 2019 in your organization:

Install Exchange Mailbox servers using the Setup wizard

Install Exchange using unattended mode

Install Exchange Edge Transport servers using the Setup wizard

Delegate the installation of Exchange servers

Exchange dev/test environment in Azure

After you've completed your installation, see Exchange post-installation tasks.

Install Exchange Mailbox servers using the Setup wizard

8/3/2020 • 5 minutes to read • Edit Online

Before you install an Exchange Server 2016 or Exchange Server 2019 Mailbox server, verify the following prerequisites:

- Verify the network, computer hardware, operating system, and software requirements at: Exchange Server system requirements and Exchange Server prerequisites.
- The target server must be a member of an Active Directory domain.
- The account that you use to install Exchange requires the following permissions[*]:
  - **Enterprise Admins group membership**: Required if this is the first Exchange server in the organization.
  - **Schema Admins group membership**: Required if you haven't previously extended the Active Directory schema or prepared Active Directory for Exchange 2016 or Exchange 2019.
  - **Exchange Organization Management role group membership**: Required if you've already prepared the Active Directory domain that will contain the Exchange server, or if other Exchange servers already exist in the organization.

  [*] Members of the **Delegated Setup** role group can install Exchange on servers that have already been provisioned in Active Directory by an Exchange administrator. For more information, see Delegate the installation of Exchange servers.
- Verify that you've read the release notes at Release notes for Exchange Server.

For more information about planning and deploying Exchange, see Planning and deployment for Exchange Server.

To install the Edge Transport role on a computer, see Install Exchange Edge Transport servers using the Setup wizard. Note that you can't install the Edge Transport role on a Mailbox server.

What do you need to know before you begin?

- Estimated time to complete: 60 minutes
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Caution

After you install Exchange on a server, you must not change the server name. Renaming a server after you've installed an Exchange server role is not supported.

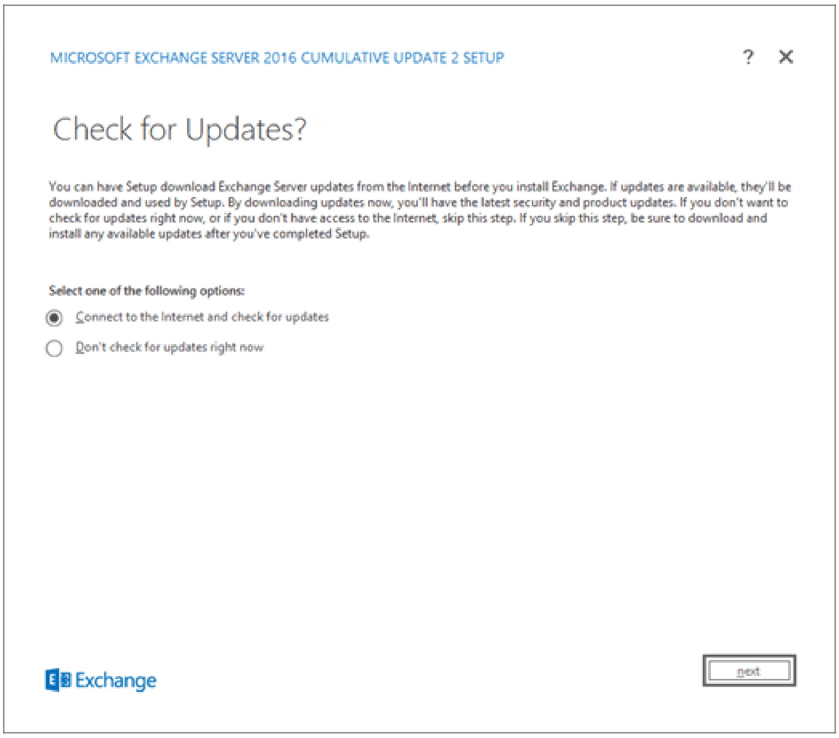
Install the Exchange Mailbox server role

1. Download the latest version of version of Exchange. For more information, see Updates for Exchange Server.
2. In File Explorer, right-click on the Exchange ISO image file that you downloaded, and then select **Mount**. In the resulting virtual DVD drive that appears, start Exchange Setup by double-clicking `Setup.exe`.

3. The Exchange Server Setup wizard opens. On the **Check for Updates?** page, choose one of the following options, and then click **Next** to continue:

   - **Connect to the Internet and check for updates**: We recommend this option, which searches for updates to the version of Exchange *that you're currently installing* (it doesn't detect newer Cumulative Updates). This option takes you to the **Downloading Updates** page that searches for updates. Click **Next** to continue.

   - **Don't check for updates right now**



MICROSOFT EXCHANGE SERVER 2016 CUMULATIVE UPDATE 2 SETUP

Check for Updates?

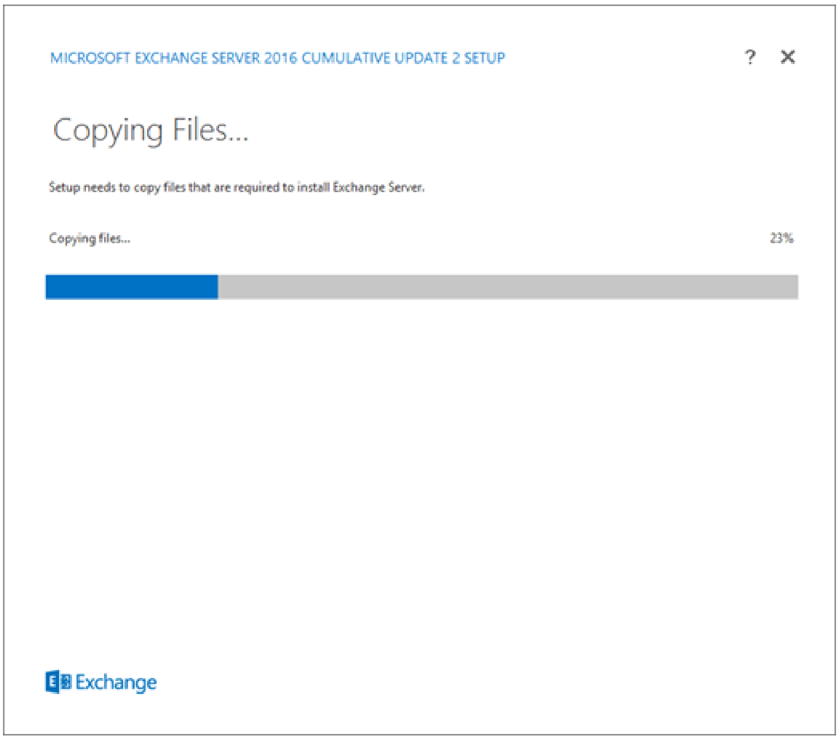
You can have Setup download Exchange Server updates from the Internet before you install Exchange. If updates are available, they'll be downloaded and used by Setup. By downloading updates now, you'll have the latest security and product updates. If you don't want to check for updates right now, or if you don't have access to the Internet, skip this step. If you skip this step, be sure to download and install any available updates after you've completed Setup.

Select one of the following options:

● Connect to the Internet and check for updates

○ Don't check for updates right now

4. The **Copying Files** page shows the progress of copying files to the local hard drive. Typically, the files are copied to `%WinDir%\Temp\ExchangeSetup`, but you can confirm the location in the Exchange Setup log at `C:\ExchangeSetupLogs\ExchangeSetup.log`.



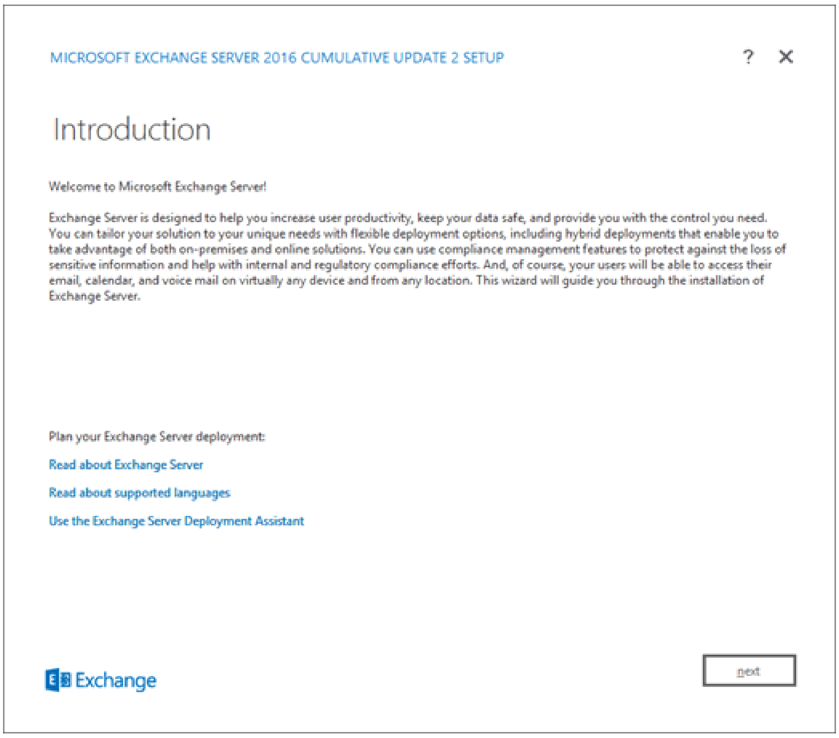
MICROSOFT EXCHANGE SERVER 2016 CUMULATIVE UPDATE 2 SETUP

Copying Files...

Setup needs to copy files that are required to install Exchange Server.

Copying files... 23%

5. On the **Introduction** page, we recommend that you visit the Exchange Server deployment planning links if you haven't already reviewed them. Click **Next** to continue.



MICROSOFT EXCHANGE SERVER 2016 CUMULATIVE UPDATE 2 SETUP

Introduction

Welcome to Microsoft Exchange Server!

Exchange Server is designed to help you increase user productivity, keep your data safe, and provide you with the control you need. You can tailor your solution to your unique needs with flexible deployment options, including hybrid deployments that enable you to take advantage of both on-premises and online solutions. You can use compliance management features to protect against the loss of sensitive information and help with internal and regulatory compliance efforts. And, of course, your users will be able to access their email, calendar, and voice mail on virtually any device and from any location. This wizard will guide you through the installation of Exchange Server.

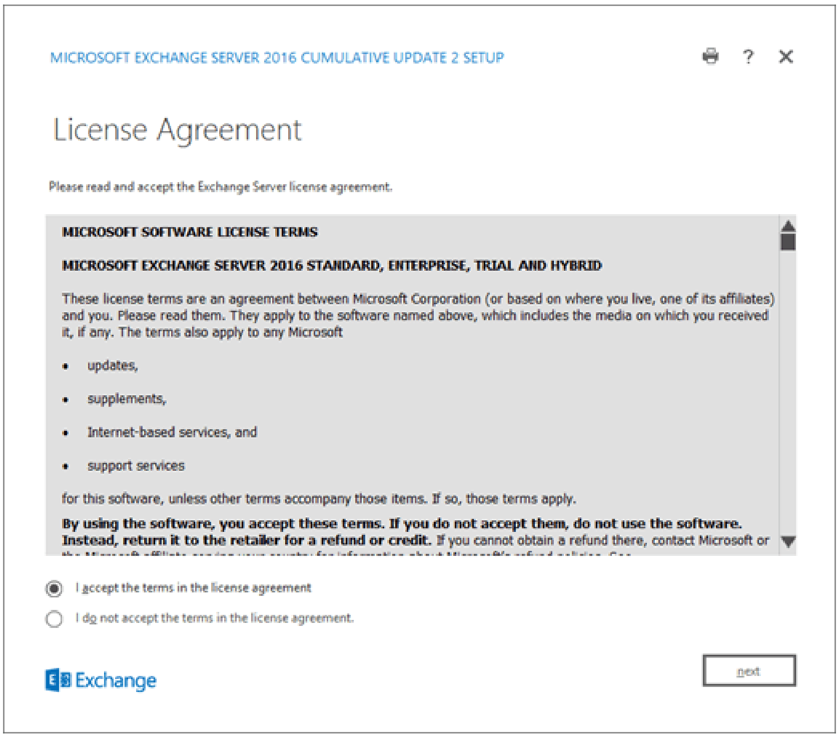
Plan your Exchange Server deployment:

Read about Exchange Server

Read about supported languages

Use the Exchange Server Deployment Assistant

6. On the **License Agreement** page, review the software license terms, select **I accept the terms in the license agreement**, and then click **Next** to continue.



MICROSOFT EXCHANGE SERVER 2016 CUMULATIVE UPDATE 2 SETUP

License Agreement

Please read and accept the Exchange Server license agreement.

MICROSOFT SOFTWARE LICENSE TERMS

MICROSOFT EXCHANGE SERVER 2016 STANDARD, ENTERPRISE, TRIAL AND HYBRID

These license terms are an agreement between Microsoft Corporation (or based on where you live, one of its affiliates) and you. Please read them. They apply to the software named above, which includes the media on which you received it, if any. The terms also apply to any Microsoft

- updates,
- supplements,
- Internet-based services, and
- support services

for this software, unless other terms accompany those items. If so, those terms apply.

By using the software, you accept these terms. If you do not accept them, do not use the software. Instead, return it to the retailer for a refund or credit. If you cannot obtain a refund there, contact Microsoft or

● I accept the terms in the license agreement

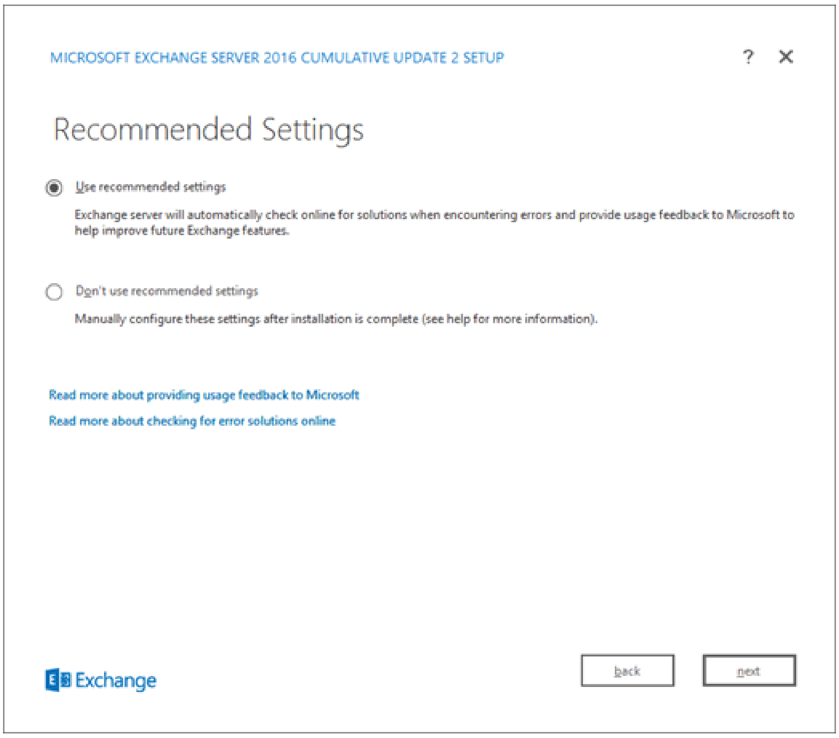
○ I do not accept the terms in the license agreement.

7. On the **Recommended Settings** page, choose one of the following settings:

- **Use recommended settings**: Exchange automatically sends error reports and information about your computer hardware and how you use Exchange to Microsoft. For information about what's sent to Microsoft and how it's used, click **?** or the help links on the page.

- **Don't use recommended settings**: These settings are disabled, but you can enable them at any time after Setup completes.

Click **Next** to continue.



MICROSOFT EXCHANGE SERVER 2016 CUMULATIVE UPDATE 2 SETUP

Recommended Settings

● Use recommended settings

Exchange server will automatically check online for solutions when encountering errors and provide usage feedback to Microsoft to help improve future Exchange features.

○ Don't use recommended settings

Manually configure these settings after installation is complete (see help for more information).

Read more about providing usage feedback to Microsoft

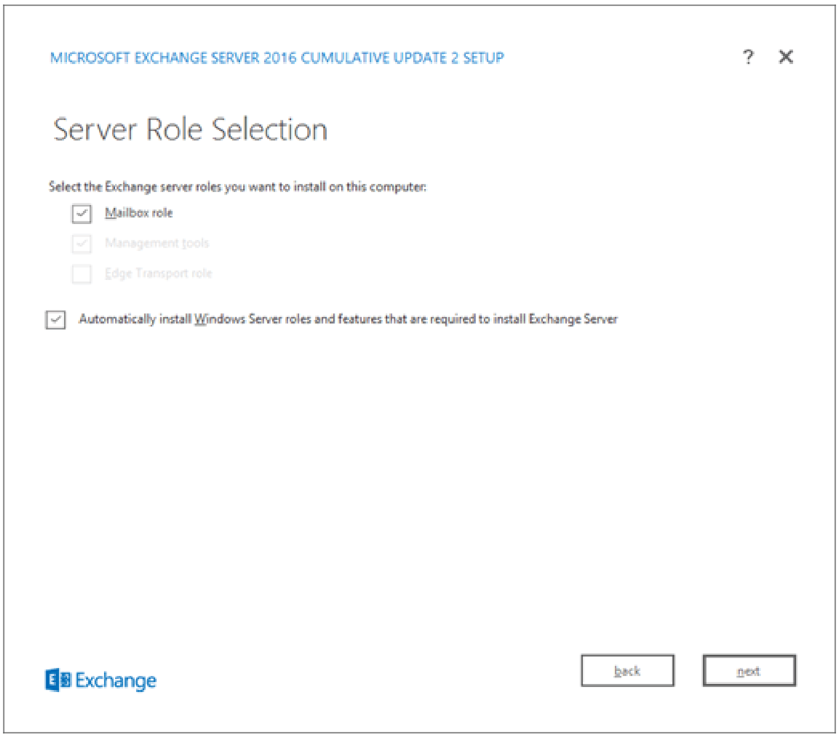
Read more about checking for error solutions online

8. On the **Server Role Selection** page, configure the following options:

   - **Mailbox role**: Select this option, which also automatically installs the **Management Tools**.
   - **Automatically install Windows Server roles and features that are required to install Exchange**: Select this option to have the Setup wizard install the required Windows prerequisites. You might need to reboot the computer to complete the installation of some Windows features. If you don't select this option, you need to install the Windows features manually.

   Note: Selecting this option installs only the *Windows features* that are required by Exchange. You need to install other prerequisites manually. For more information, see Exchange Server prerequisites.

   Click **Next** to continue.



MICROSOFT EXCHANGE SERVER 2016 CUMULATIVE UPDATE 2 SETUP

Server Role Selection

Select the Exchange server roles you want to install on this computer:

☑ Mailbox role

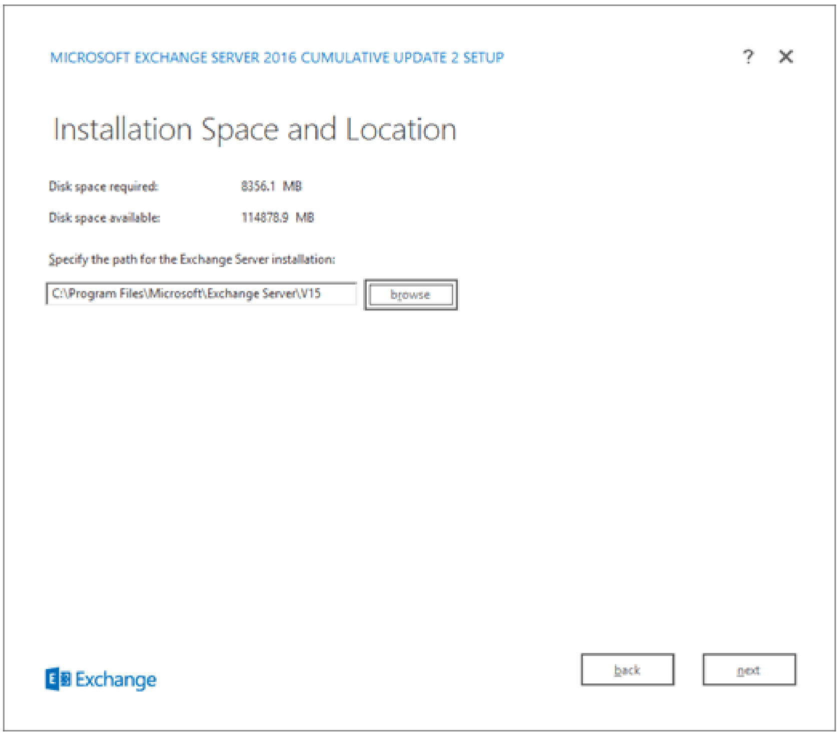
☑ Management tools

□ Edge Transport role

☑ Automatically install Windows Server roles and features that are required to install Exchange Server

9. On the **Installation Space and Location** page, either accept the default installation location (`C:\Program Files\Microsoft\Exchange Server\V15`), or click **Browse** to choose a new location. Make sure

that you have enough disk space available in the location where you want to install Exchange. Click **Next** to continue.



MICROSOFT EXCHANGE SERVER 2016 CUMULATIVE UPDATE 2 SETUP

Installation Space and Location

Disk space required: 8356.1 MB

Disk space available: 114878.9 MB

Specify the path for the Exchange Server installation:

C:\Program Files\Microsoft\Exchange Server\V15

10. If this is the first Exchange 2016 or Exchange 2019 server in your organization and you haven't already done the steps in Prepare Active Directory and domains for Exchange, you arrive on the **Exchange Organization** page. On this page, configure the following settings:

    - **Specify the name for this Exchange organization**: The default value is **First Organization**, but you typically use the company name for this value. The organization name is used internally by Exchange, isn't typically seen by users, doesn't affect the functionality of Exchange, and doesn't determine what you can use for email addresses.

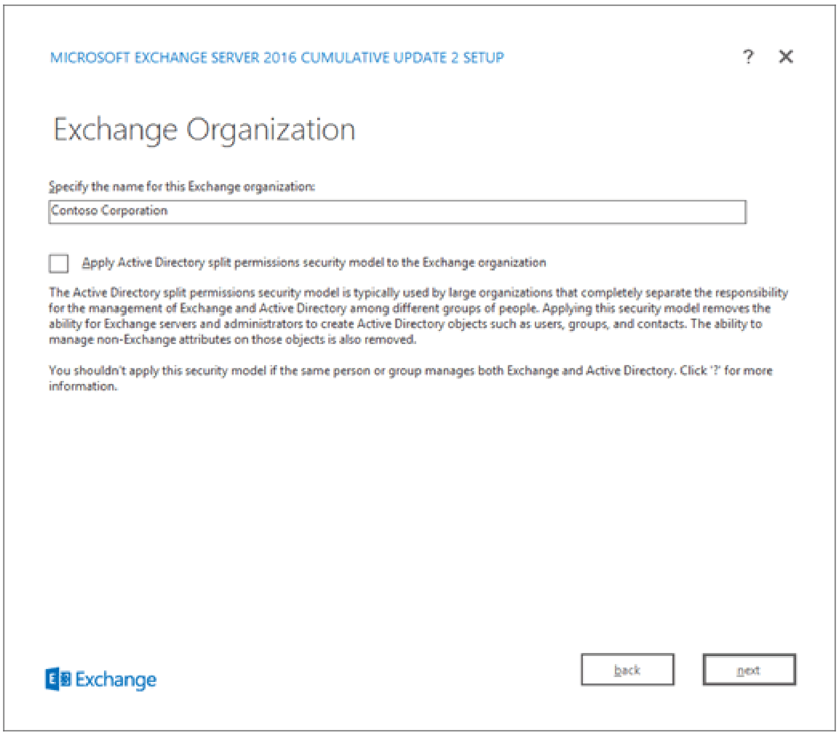
        - The organization name can't contain more than 64 characters, and can't be blank.

        - Valid characters are A to Z, a to z, 0 to 9, hyphen or dash (-), and space, but leading or trailing spaces aren't allowed.

        - You can't change the organization name after it's set.

    - **Apply Active Directory split permission security model to the Exchange organization**: Most organizations don't need to select this option. If you need to separate management of Active Directory security principals and the Exchange configuration, split permissions might work for you. For more information, click **?**.

    Click **Next** to continue.



MICROSOFT EXCHANGE SERVER 2016 CUMULATIVE UPDATE 2 SETUP

Exchange Organization

Specify the name for this Exchange organization:

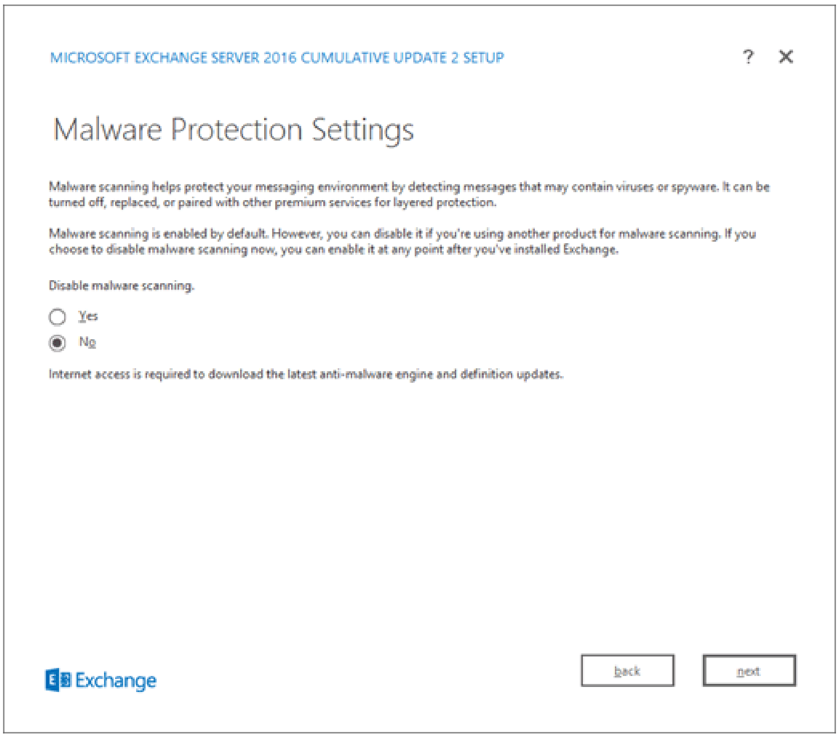
Contoso Corporation

□ Apply Active Directory split permissions security model to the Exchange organization

The Active Directory split permissions security model is typically used by large organizations that completely separate the responsibility for the management of Exchange and Active Directory among different groups of people. Applying this security model removes the ability for Exchange servers and administrators to create Active Directory objects such as users, groups, and contacts. The ability to manage non-Exchange attributes on those objects is also removed.

You shouldn't apply this security model if the same person or group manages both Exchange and Active Directory. Click '?' for more information.

11. On the **Malware Protection Settings** page, choose whether you want disable malware scanning. Malware scanning is enabled by default (the value **No** is selected). If you disable malware scanning, you can enable it in the future. Click **Next** to continue.



MICROSOFT EXCHANGE SERVER 2016 CUMULATIVE UPDATE 2 SETUP

Malware Protection Settings

Malware scanning helps protect your messaging environment by detecting messages that may contain viruses or spyware. It can be turned off, replaced, or paired with other premium services for layered protection.

Malware scanning is enabled by default. However, you can disable it if you're using another product for malware scanning. If you choose to disable malware scanning now, you can enable it at any point after you've installed Exchange.

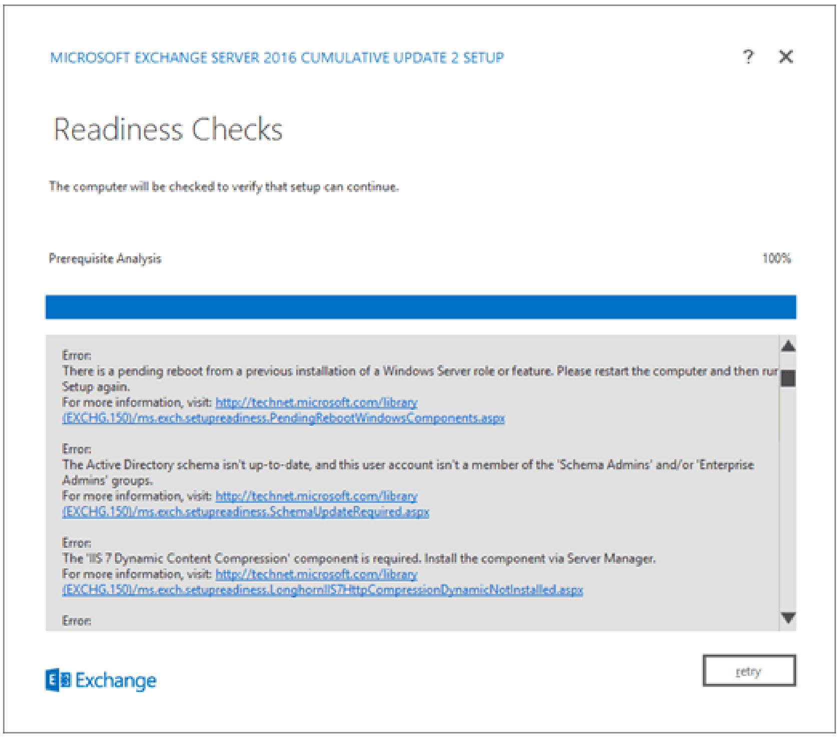
Disable malware scanning.

○ Yes

● No

Internet access is required to download the latest anti-malware engine and definition updates.

12. On the **Readiness Checks** page, verify that the organization and server role prerequisite checks completed successfully. If they haven't, the only option on the page is **Retry**, so you need to resolve the errors before you can continue.



MICROSOFT EXCHANGE SERVER 2016 CUMULATIVE UPDATE 2 SETUP

Readiness Checks

The computer will be checked to verify that setup can continue.

Prerequisite Analysis 100%

Error:
There is a pending reboot from a previous installation of a Windows Server role or feature. Please restart the computer and then rur
Setup again.
For more information, visit: http://technet.microsoft.com/library
(EXCHG.150)/ms.exch.setupreadiness.PendingRebootWindowsComponents.aspx

Error:
The Active Directory schema isn't up-to-date, and this user account isn't a member of the 'Schema Admins' and/or 'Enterprise
Admins' groups.
For more information, visit: http://technet.microsoft.com/library
(EXCHG.150)/ms.exch.setupreadiness.SchemaUpdateRequired.aspx

Error:
The 'IIS 7 Dynamic Content Compression' component is required. Install the component via Server Manager.

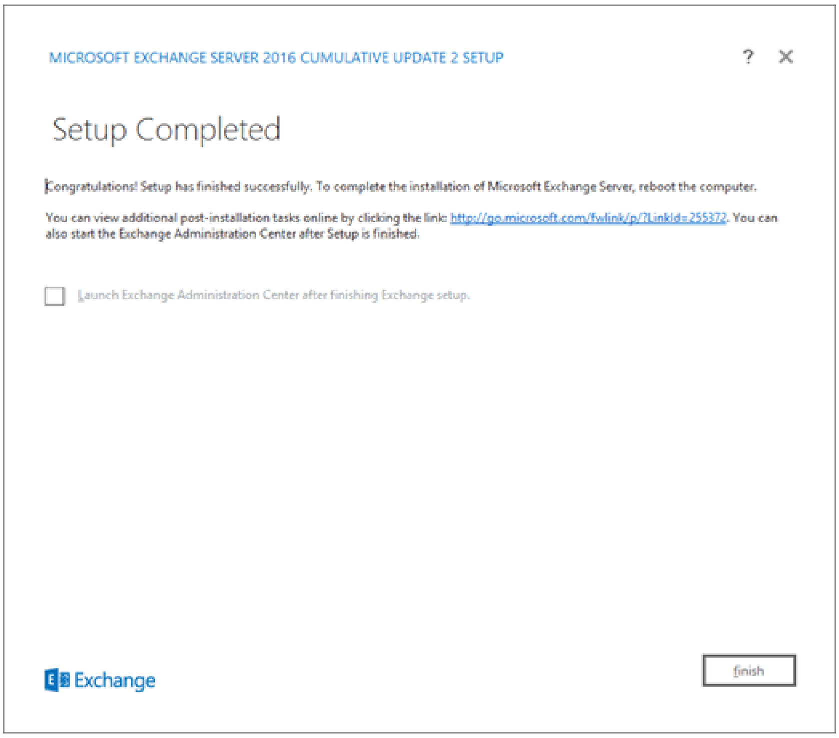
5%

14. On the **Setup Completed** page, click **Finish**, and then restart the computer.



Setup Completed

Congratulations! Setup has finished successfully. To complete the installation of Microsoft Exchange Server, reboot the computer.

You can view additional post-installation tasks online by clicking the link: http://go.microsoft.com/fwlink/p/?LinkId=255372. You can also start the Exchange Administration Center after Setup is finished.

□ Launch Exchange Administration Center after finishing Exchange setup.

Next steps

- To verify that you've successfully installed Exchange, see Verify an Exchange installation.
- Complete your deployment by performing the tasks provided in Exchange post-installation tasks.
- Having problems? Ask for help in the Exchange forums. Visit the forums at Exchange Server.

Install Exchange Edge Transport servers using the Setup wizard

8/3/2020 • 4 minutes to read • Edit Online

Before you install an Exchange Server 2016 or Exchange Server 2019 Edge Transport server, verify the following prerequisites:

- We recommend that you install Edge Transport servers in a perimeter network that's outside of your organization's internal Active Directory forest. Installing the Edge Transport server role on domain-joined computers only enables domain management of Windows features and settings. Edge Transport servers don't directly access Active Directory. Instead, they use Active Directory Lightweight Directory Services (AD LDS) to store configuration and recipient information. For more information about the Edge Transport role, see Edge Transport servers.

> **NOTE**
> When Exchange Server 2019 Edge Transport server is domain-joined, a user from that domain must run the Exchange Management Shell. If a local user signs into the server, cmdlets in the Exchange Management Shell will result in "Access Denied".

- Verify the network, computer hardware, operating system, and software requirements at: Exchange Server system requirements and Exchange Server prerequisites.
- Verify the local account on the target computer is a member of the local Administrators group.
- Verify that you've read the release notes at Release notes for Exchange Server.

For more information about planning and deploying Exchange, see Planning and deployment for Exchange Server.

To install the Mailbox role on a computer, see Install Exchange Mailbox servers using the Setup wizard. Note that you can't install the Edge Transport role on a Mailbox server.

What do you need to know before you begin?

- Estimated time to complete: 40 minutes
- You need to configure the primary DNS suffix on the computer. For example, if the fully qualified domain name of your computer is edge.contoso.com, the DNS suffix for the computer is contoso.com. For more information, see Primary DNS Suffix is missing [ms.exch.setupreadiness.FqdnMissing].
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Caution

After you install Exchange on a server, you must not change the server name. Renaming a server after you've installed an Exchange server role is not supported.

Install the Exchange Edge Transport server role

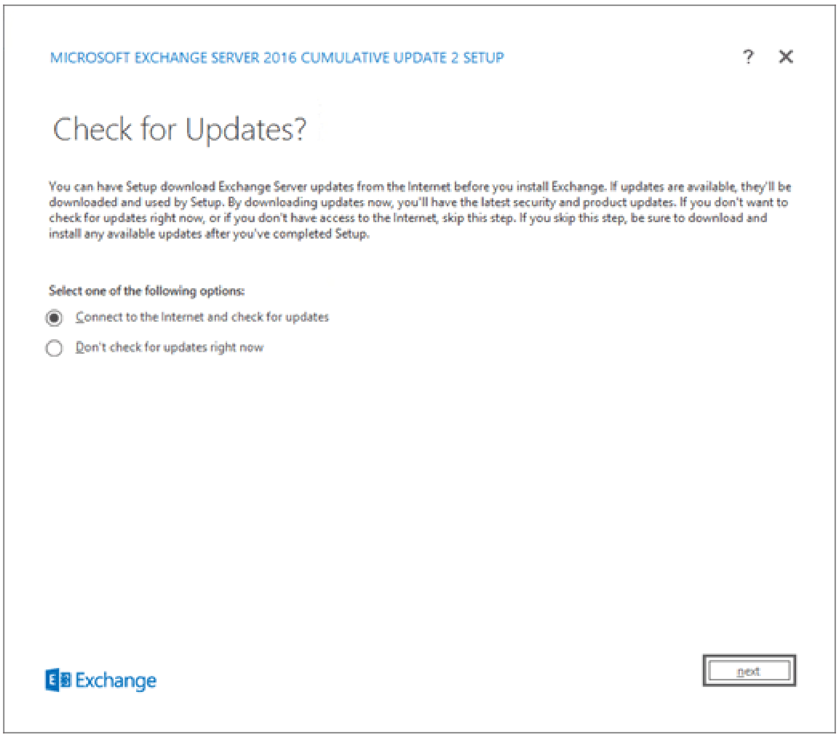
1. Download the latest version of Exchange. For more information, see Updates for Exchange Server.
2. In File Explorer, right-click on the Exchange ISO image file that you downloaded, and then select **Mount**. In

the resulting virtual DVD drive that appears, start Exchange Setup by double-clicking `Setup.exe`.

3. The Exchange Server Setup wizard opens. On the **Check for Updates?** page, choose one of the following options, and then click **Next** to continue:

   - **Connect to the Internet and check for updates**: We recommend this option, which searches for updates to the version of Exchange *that you're currently installing* (it doesn't detect newer Cumulative Updates). This option takes you to the **Downloading Updates** page that searches for updates. Click **Next** to continue.

   - **Don't check for updates right now**



MICROSOFT EXCHANGE SERVER 2016 CUMULATIVE UPDATE 2 SETUP

Check for Updates?

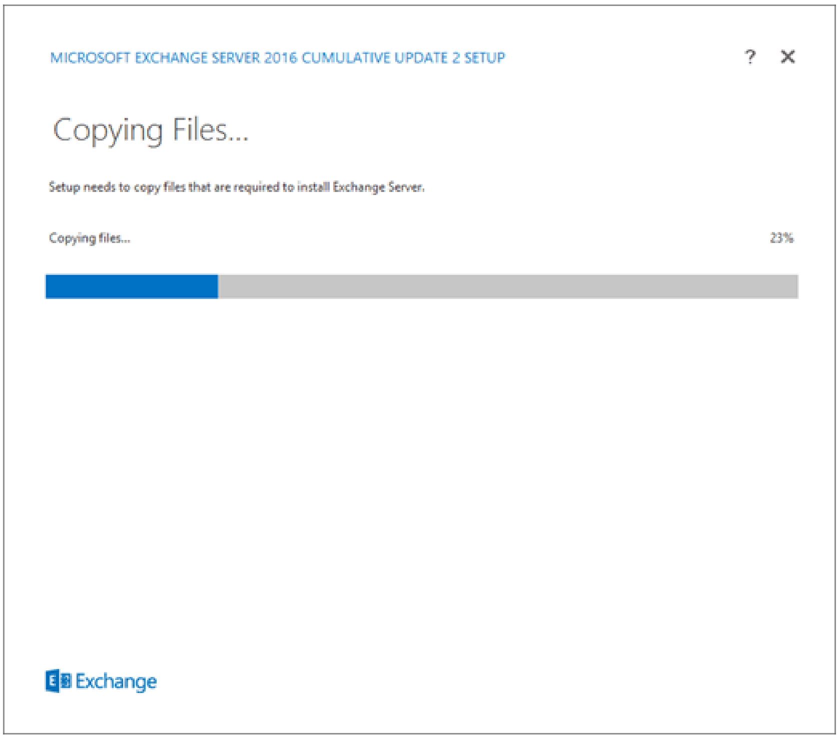
You can have Setup download Exchange Server updates from the Internet before you install Exchange. If updates are available, they'll be downloaded and used by Setup. By downloading updates now, you'll have the latest security and product updates. If you don't want to check for updates right now, or if you don't have access to the Internet, skip this step. If you skip this step, be sure to download and install any available updates after you've completed Setup.

Select one of the following options:

● Connect to the Internet and check for updates

○ Don't check for updates right now

4. The **Copying Files** page shows the progress of copying files to the local hard drive. Typically, the files are copied to `%WinDir%\Temp\ExchangeSetup`, but you can confirm the location in the Exchange Setup log at `C:\ExchangeSetupLogs\ExchangeSetup.log`.



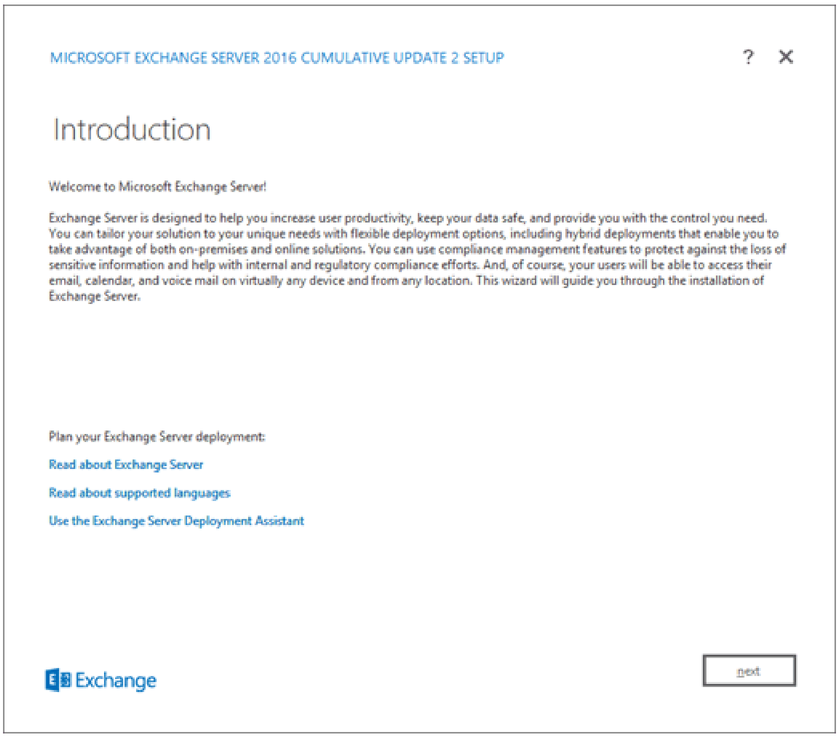
MICROSOFT EXCHANGE SERVER 2016 CUMULATIVE UPDATE 2 SETUP

Copying Files...

Setup needs to copy files that are required to install Exchange Server.

Copying files... 23%

5. On the **Introduction** page, we recommend that you visit the Exchange Server deployment planning links if you haven't already reviewed them. Click **Next** to continue.



MICROSOFT EXCHANGE SERVER 2016 CUMULATIVE UPDATE 2 SETUP

Introduction

Welcome to Microsoft Exchange Server!

Exchange Server is designed to help you increase user productivity, keep your data safe, and provide you with the control you need. You can tailor your solution to your unique needs with flexible deployment options, including hybrid deployments that enable you to take advantage of both on-premises and online solutions. You can use compliance management features to protect against the loss of sensitive information and help with internal and regulatory compliance efforts. And, of course, your users will be able to access their email, calendar, and voice mail on virtually any device and from any location. This wizard will guide you through the installation of Exchange Server.

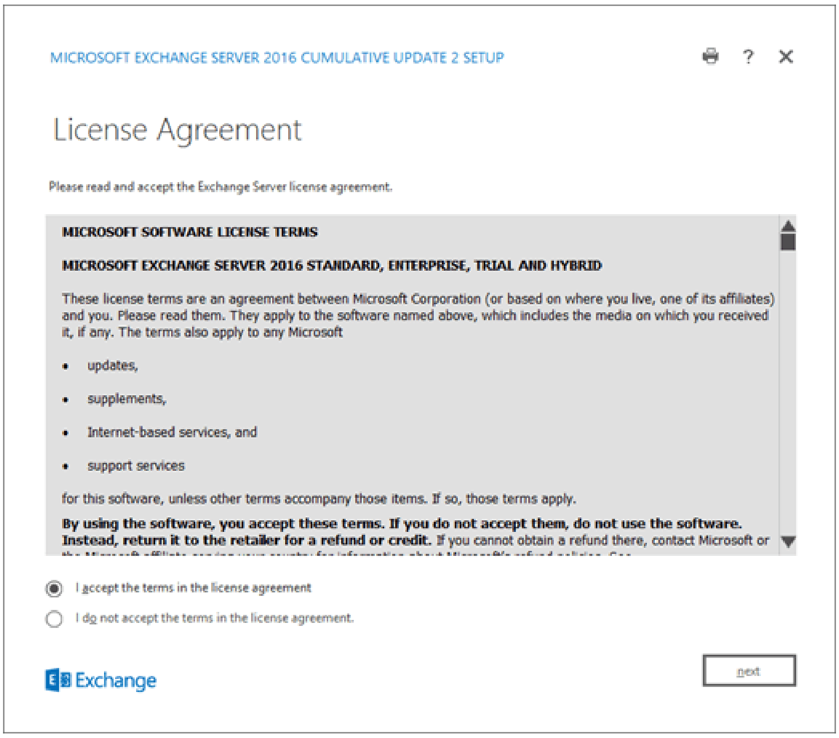
Plan your Exchange Server deployment:

Read about Exchange Server

Read about supported languages

Use the Exchange Server Deployment Assistant

6. On the **License Agreement** page, review the software license terms, select **I accept the terms in the license agreement**, and then click **Next** to continue.



MICROSOFT EXCHANGE SERVER 2016 CUMULATIVE UPDATE 2 SETUP

License Agreement

Please read and accept the Exchange Server license agreement.

MICROSOFT SOFTWARE LICENSE TERMS

MICROSOFT EXCHANGE SERVER 2016 STANDARD, ENTERPRISE, TRIAL AND HYBRID

These license terms are an agreement between Microsoft Corporation (or based on where you live, one of its affiliates) and you. Please read them. They apply to the software named above, which includes the media on which you received it, if any. The terms also apply to any Microsoft

- updates,
- supplements,
- Internet-based services, and
- support services

for this software, unless other terms accompany those items. If so, those terms apply.

By using the software, you accept these terms. If you do not accept them, do not use the software. Instead, return it to the retailer for a refund or credit. If you cannot obtain a refund there, contact Microsoft or

● I accept the terms in the license agreement

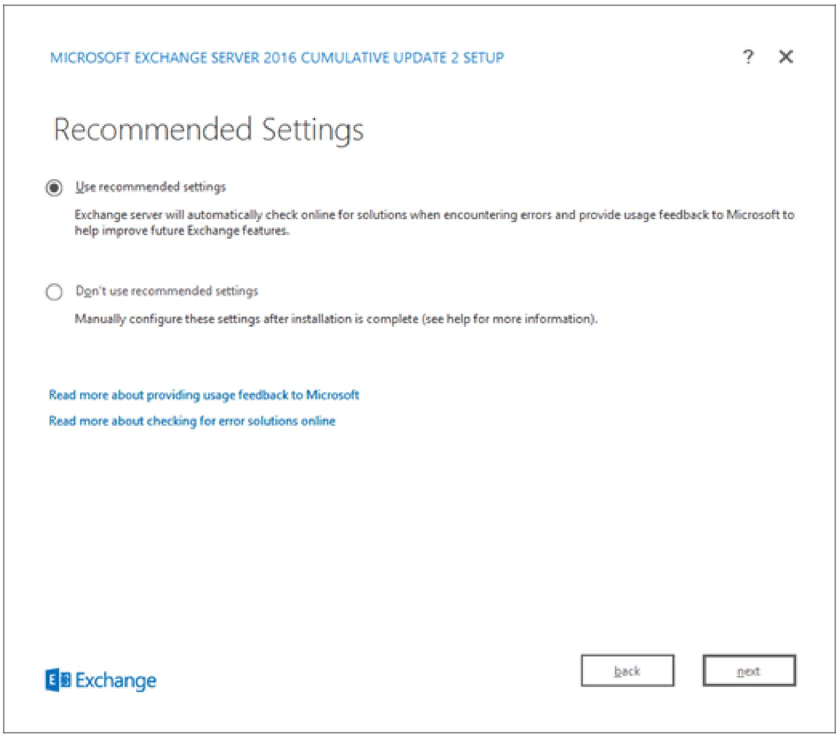
○ I do not accept the terms in the license agreement.

7. On the **Recommended Settings** page, choose one of the following settings:

   - **Use recommended settings**: Exchange automatically sends error reports and information about your computer hardware and how you use Exchange to Microsoft. For information about what's sent to Microsoft and how it's used, click **?** or the help links on the page.

   - **Don't use recommended settings**: These settings are disabled, but you can enable them at any time after Setup completes.

   Click **Next** to continue.



MICROSOFT EXCHANGE SERVER 2016 CUMULATIVE UPDATE 2 SETUP

Recommended Settings

● Use recommended settings

Exchange server will automatically check online for solutions when encountering errors and provide usage feedback to Microsoft to help improve future Exchange features.

○ Don't use recommended settings

Manually configure these settings after installation is complete (see help for more information).

Use unattended mode in Exchange Setup

8/3/2020 • 14 minutes to read • Edit Online

Running Exchange Setup from the command line allows you to automate the installation of Exchange do and other related tasks on Exchange servers (for example, remove an existing Exchange server or recover a failed Exchange server).

This topic describes the available command line switches, and provides examples.

For more information about planning for Exchange 2016 or Exchange 2019, see Planning and deployment for Exchange Server.

For information about tasks to complete after installation, see Exchange Server post-installation tasks.

Primary command line switches for unattended mode

The primary (top-level, scenario-defining) command line switches that are available in unattended Setup mode in Exchange 2016 or Exchange 2019 are described in the following table:

SWITCH	DESCRIPTION
/IAcceptExchangeServerLicenseTerms	This switch is required in all unattended setup commands (whenever you run Setup.exe with any additional switches). If you don't use this switch, you'll get an error. To read the license terms, visit Microsoft License Terms.
/Mode:<InstallationMode> (or */m:<InstallationMode>*)	Valid values are: • **Install**: Installs Exchange on a new server using the Exchange server roles specified by the */Roles* switch. This is the default value if the command doesn't use the */Mode* switch. • **Uninstall**: Uninstalls Exchange from a working server. • **Upgrade**: Installs a Cumulative Update (CU) on an Exchange server. • **RecoverServer**: Recovers an Exchange server using the existing Exchange server object in Active Directory after a catastrophic hardware or software failure on the server. For instructions, see Recover Exchange servers.
/Roles:<ServerRole> (or */Role:<ServerRole>* or */r:<ServerRole>*)	This switch is required in `/Mode:Install` commands. Valid values are: • **Mailbox (or mb)**: Installs the Mailbox server role and the Exchange management tools on the local server. This is the default value. You can't use this value with **EdgeTransport**. • **EdgeTransport (or et)**: Installs the Edge Transport server role and the Exchange management tools on the local server. You can't use this value with **Mailbox**. • **ManagementTools (or mt or t)**: Installs the Exchange management tools on clients or other Windows servers that aren't running Exchange.
/PrepareAD (or */p*) */PrepareSchema* (or */ps*) */PrepareDomain:<DomainFQDN>* (or */pd:<DomainFQDN>*) */PrepareAllDomains* (or */pad*)	Use these switches to extend the Active Directory schema for Exchange, prepare Active Directory for Exchange, and prepare some or all Active Directory domains for Exchange. For more information, see Prepare Active Directory and domains for Exchange
/NewProvisionedServer[:<ServerName>] (or */nprs[:<ServerName>]* */RemoveProvisionedServer:<ServerName>* (or */rprs:<ServerName>*)	The */NewProvisionedServer* switch creates the Exchange server object in Active Directory. After that, a member of the Delegated Setup role group can install Exchange on the server. For more information, see Delegate the installation of Exchange servers. The */RemoveProvisionedServer* switch removes a provisioned Exchange server object from Active Directory *before* Exchange is installed on the server.
/AddUmLanguagePack:<Culture1>,<Culture2>...<CultureN> */RemoveUmLanguagePack:<Culture1>,<Culture2>...<CultureN>*	**Note**: These switches aren't available in Exchange 2019. They're only available in Exchange 2016. Adds or removes Unified Messaging (UM) language packs from existing Exchange 2016 Mailbox servers. UM language packs enable callers and Outlook Voice Access users to interact with the UM system in those languages. You can't add or remove the en-US language pack. You can install language packs on existing Mailbox servers by using the */AddUmLanguagePack* switch or by running the UMLanguagePack.<Culture>.exe file directly. You can only remove installed language packs by using the */RemoveUmLanguagePack* switch. For more information, see UM languages, prompts, and greetings.

Optional command line switches for unattended mode

The optional (supporting) command line switches that are available in unattended Setup mode in Exchange 2016 or Exchange 2019 are described in the following table:

SWITCH	VALID VALUES	DEFAULT VALUE	**AVAILABLE WITH	DESCRIPTION**
/ActiveDirectorySplitPermissions:<TrueOrFalse>	True or False	False	`/Mode:Install /Roles:Mailbox` or */PrepareAD* commands for the first Exchange server in the organization.	Specifies the Active Directory split permissions model when preparing Active Directory. For more information, see the "Active Directory split permissions" section in Understanding split permissions.
/AdamLdapPort:<TCPPortNumber>	A valid TCP port number	50389	`/Mode:Install /Roles:EdgeTransport` commands	Specifies a custom LDAP port to use for the Active Directory Lightweight Directory Services (AD LDS) instance on Edge Transport servers. The value is stored in the registry at `HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Exchange` .
/AdamSslPort:<TCPPortNumber>	A valid TCP port number	50636	`/Mode:Install /Roles:EdgeTransport` commands	Specifies a custom SSL (TLS) port to use for the AD LDS instance on Edge Transport servers. The value is stored in the registry at `HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Exchange` .

SWITCH	VALID VALUES	DEFAULT VALUE	**AVAILABLE WITH	DESCRIPTION**
/AnswerFile:"<PathAndFileName>" (or *af:"<PathAndFileName>"*)	The name and location of a text file (for example,"D:\Server data\answer.txt").	n/a	`/Mode:Install /Roles:Mailbox` or `/Mode:Install /Roles:EdgeTransport` commands	Use this switch to create a text file that you can use to install Exchange on multiple computers with the same settings. You can use the following switches in the answer file: *AdamLdapPort*, *AdamSslPort*, *CustomerFeedbackEnabled*, *DbFilePath*, *DisableAMFiltering*, *DoNotStartTransport*, *EnableErrorReporting*, *IAcceptExchangeServerLicenseTerms*, *LogFolderPath*, *Mdbname*, *OrganizationName*, *TenantOrganizationConfig*, and *UpdatesDir*. Don't use the forward slash character (/) with the switches in the answer file. Put each switch or switch/value pair on one line in the file.
/CustomerFeedbackEnabled:<TrueOrFalse>	True or False	False	`/Mode:Install` and */PrepareAD* commands	Specifies whether to allow or prevent Exchange from providing usage feedback to Microsoft to help improve future Exchange features. You can enable or disable error reporting on the server after setup is complete by using the *ErrorReportingEnabled* parameter on the **Set-ExchangeServer** cmdlet.
/DbFilePath:"<Path>\<FileName>.edb"	A folder path and an .edb filename (for example, "D:\Exchange Database Files\DB01\db01.edb").	**%ExchangeInstallPath%Mailbox\<DatabaseName>\<DatabaseName>.edb** where: • <DatabaseName> is **Mailbox Database <10DigitNumber>** that matches the default name of the database **or** the value you specified with the */MdbName* switch (without the .edb file name extension). • %ExchangeInstallPath% is **%ProgramFiles%\Microsoft\Exchange Server\V15\** or the location you specified with the */TargetDir* switch.	`/Mode:Install /Roles:Mailbox` commands	Specifies the location of the first mailbox database that's created on the new Mailbox server. You can specify the name of the database file with the */MdbName* switch and the location of the database transaction log files with the */LogFolderPath* switch.
/DisableAMFiltering	n/a	n/a	`/Mode:Install /Roles:Mailbox` commands	Disables the built-in Exchange antimalware filtering on Mailbox servers. For more information about antimalware filtering, see Antimalware protection in Exchange Server.
/DomainController:<ServerNameOrFQDN> (or */dc:<ServerNameOrFQDN>*)	The server name (for example, DC01) or FQDN (for example, dc01.contoso.com) of the domain controller.	A randomly-selected domain controller in the same Active Directory site as the target server where you're running Setup.	All */Mode* commands (except when you're installing an Edge Transport server) or */PrepareAD*, */PrepareSchema*, */PrepareDomain* and */PrepareAllDomains* commands	Specifies the domain controller that Exchange Setup uses to read from and write to Active Directory. The domain controller must meet the minimum requirements for Exchange 2016 or Exchange 2019. If you use this switch in */PrepareSchema* or */PrepareAD* commands that extend the Active Directory schema for Exchange, you must specify the schema master; otherwise, you'll get an error.
/DoNotStartTransport	n/a	n/a	`/Mode:Install /Roles:Mailbox` , `/Mode:Install /Roles:EdgeTransport` , and `/Mode:RecoverServer` commands.	Tells Setup to not start the Microsoft Exchange Transport service (mail flow) on Mailbox servers or Edge Transport servers after Setup is complete. You can use this switch to configure additional settings before the server accepts email messages (for example, configure antispam agents or move the queue database back onto a recovered Exchange server.)
/EnableErrorReporting	n/a	Disabled	`/Mode:Install` , `/Mode:Upgrade` , and `/Mode:RecoverServer` commands	Specifies whether to allow Exchange to automatically check online for solutions to errors that it encounters. You can enable or disable error reporting on the server after setup is complete by using the *ErrorReportingEnabled* parameter on the **Set-ExchangeServer** cmdlet.

SWITCH	VALID VALUES	DEFAULT VALUE	**AVAILABLE WITH	DESCRIPTION**
/InstallWindowsComponents	n/a	n/a	`/Mode:Install` commands	Installs the required Windows roles and features for the specified Exchange server role. If a reboot is required, Setup will resume where the installation ended.
/LogFolderPath:"<Path>"	A folder path (for example, "E:\Exchange Database Logs").	**%ExchangeInstallPath%Mailbox\\<DatabaseName>** where: • <DatabaseName> is **Mailbox Database <10DigitNumber>** that matches the default name of the database **or** the value you specified with the */MdbName* switch (without the .edb file name extension). • %ExchangeInstallPath% is **%ProgramFiles%\Microsoft\Exchange Server\V15\** or the location you specified with the */TargetDir* switch.	`/Mode:Install /Roles:Mailbox` commands	Specifies the location of the transaction log files for the first mailbox database that's created on the new Mailbox server. You can specify the location of the database files with the */DbFilePath* switch.
/MdbName:"<FileName>"	A database filename without the .edb extension (for example, "db01")	**Mailbox Database <10DigitNumber>** (for example, **Mailbox Database 0139595516**).	`/Mode:Install /Roles:Mailbox` commands	Specifies the name of the first mailbox database that's created on the new Mailbox server. You can specify the location of the database files with the */DbFilePath* switch.
/OrganizationName:"<Organization Name>" (or */on:"<Organization Name>"*)	A text string (for example, "Contoso Corporation").	Blank in command line setup; **First Organization** in the Exchange Setup wizard.	`/Mode:Install /Roles:Mailbox` or */PrepareAD* commands for the first Exchange server in the organization.	The organization name is used internally by Exchange, isn't typically seen by users, doesn't affect the functionality of Exchange, and doesn't determine what you can use for email addresses. • The organization name can't contain more than 64 characters, and can't be blank. • Valid characters are A to Z, a to z, 0 to 9, hyphen or dash (-), and space, but leading or trailing spaces aren't allowed. • You can't change the organization name after it's set.
/SourceDir:"<Path>" (or */s:"<Path>"*)	A folder path (for example, "Z:\Exchange).	The ServerRoles\UnifiedMessaging folder on the Exchange installation media.	*/AddUmLanguagePack* commands in Exchange 2016 (not available in Exchange 2019)	Specifies the location of the language packs (UMLanguagePack.<Culture>.exe files) to install on existing Exchange 2016 Mailbox servers.
/TargetDir:"<Path>" (or */t:"<Path>"*)	A folder path (for example, "D:\Program Files\Microsoft\Exchange").	**%ProgramFiles%\Microsoft\Exchange Server\V15\**	`/Mode:Install` and `/Mode:RecoverServer` commands	Specifies where to install Exchange on the server. You can't install Exchange in the root of a drive (for example, C:\), or on a ROM drive, RAM disk, network drive, removable disk, or unknown drive type. When you recover a failed Exchange server that was installed using a custom installation path, you need to use this switch to specify the custom path during the recovery.
/TenantOrganizationConfig:"<Path>"	A folder path (for example "C:\Data")	n/a	`/Mode:Install` or */PrepareAD* commands.	Required in hybrid deployments between on-premises organizations and Microsoft 365 or Office 365 to specify the location of the text file that contains the configuration information for your Microsoft 365 or Office 365 organization. You create this file by running the **Get-OrganizationConfig** cmdlet in Exchange Online PowerShell in your Microsoft 365 or Office 365 organization.
/UpdatesDir:"<Path>" (or */u:"<Path>"*)	A folder path (for example, "D:\Downloads\Exchange Updates").	The Updates folder at the root of the Exchange installation media.	`/Mode:Install`, `/Mode:Upgrade`, `/Mode:RecoverServer`, and */AddUmLanguagePack* commands.	Specifies the source location of updates for Setup to install. You can only specify one folder for updates. Any UM language packs located in this folder will be **automatically** installed on the target Exchange 2016 Mailbox server.

What do you need to know before you begin?

- Download the latest version of Exchange on the target computer. For more information, see Updates for Exchange Server.
- Verify the network, computer hardware, operating system, and software requirements at: Exchange Server system requirements and Exchange Server prerequisites.
- Verify that you've read the release notes at Release notes for Exchange Server.

  Caution

  After you install Exchange on a server, you must not change the server name. Renaming a server after you've installed an Exchange server role is not supported.

- For Mailbox servers:
  - Estimated time to complete: 60 minutes
  - The target server must be a member of an Active Directory domain.
  - The account that you use to install Exchange requires the following permissions:*:
    - **Enterprise Admins group membership**: Required if this is the first Exchange server in the organization.
    - **Schema Admins group membership**: Required if you haven't previously extended the Active Directory schema or prepared Active Directory for Exchange.
    - **Exchange Organization Management role group membership**: Required if you've already prepared the Active Directory domain that will contain the Exchange server, or if other Exchange servers already exist in the organization.

    * Members of the **Delegated Setup** role group can install Exchange on servers that have already been provisioned in Active Directory by an Exchange administrator. For more information, see Delegate the installation of Exchange servers.
- For Edge Transport servers:
  - Estimated time to complete: 40 minutes
  - We recommend that you install Edge Transport servers in a perimeter network that's outside of your organization's internal Active Directory forest. Installing the Edge Transport server role on domain-joined computers only enables domain management of Windows features and settings. Edge Transport servers don't directly access Active Directory. Instead, they use Active Directory Lightweight Directory Services (AD LDS) to store configuration and recipient information. For more information about the Edge Transport role, see Edge Transport servers.
  - Verify the local account on the target computer is a member of the local Administrators group on the target server.
  - You need to configure the primary DNS suffix on the computer. For example, if the fully qualified domain name of your computer is edge.contoso.com, the DNS suffix for the computer is contoso.com. For more information, see Primary DNS Suffix is missing [ms.exch.setupreadiness.FqdnMissing].
  - In coexistence scenarios, Exchange 2010 Hub Transport servers need an update before you can subscribe a Exchange 2016 Edge Transport server to an Active Directory site that contains Exchange 2010 Hub Transport servers. If you don't install this update, the EdgeSync Subscription won't work correctly for Exchange 2010 Hub Transport server that participate in EdgeSync synchronization. For more information, see Supported coexistence scenarios for Exchange 2016.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Use Setup.exe to install Exchange in unattended mode

1. On the target server, open File Explorer, right-click on the Exchange ISO image file that you downloaded, and then select **Mount**. Note the virtual DVD drive letter that's assigned.
2. Open a Windows Command Prompt window. For example:
   - Press the Windows key + 'R' to open the **Run** dialog, type cmd.exe, and then press **OK**.
   - Press **Start**. In the **Search** box, type **Command Prompt**, then in the list of results, select **Command Prompt**.
3. In the Command Prompt window, use the following syntax:

   ```
   <Virtual DVD drive letter>:\Setup.exe /IAcceptExchangeServerLicenseTerms [Switches]
   ```

   Setup copies the setup files to the local computer.

   Setup checks the prerequisites, including all prerequisites specific to the server roles that you're installing. If you haven't met all the prerequisites, Setup fails and returns an error message that explains the reason for the failure. If you've met all the prerequisites, Setup installs Exchange.
4. Restart the server after the Exchange installation is complete.
5. Complete your deployment by performing the tasks provided in Exchange Server post-installation tasks.

Unattended mode examples

Prepare Active Directory for Exchange in unattended mode

This example configures "Fabrikam Ltd" as the Exchange organization name in Active Directory and prepares Active Directory for the version of Exchange that's being installed.

```
Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareAD /OrganizationName:"Fabrikam Ltd"
```

For more information, see Prepare Active Directory and domains for Exchange.

Install Mailbox servers in unattended mode

- This example installs the first Exchange server (Mailbox server) in the organization, configures "Contoso Corporation" as the Exchange organization name in Active Directory, and installs the Exchange management tools on the local server.

  ```
  Setup.exe /IAcceptExchangeServerLicenseTerms /Mode:Install /Roles:Mailbox /on:"Contoso Corporation"
  ```

- This example installs the Mailbox server role and the management tools in the default folder on the local server in an organization where Active Directory has already been prepared for the version of Exchange that's being installed.

  ```
  Setup.exe /IAcceptExchangeServerLicenseTerms /mode:Install /r:MB
  ```

- This example installs the Mailbox server role and the management tools in the "C:\Exchange Server" folder on the local server.

  ```
  Setup.exe /IAcceptExchangeServerLicenseTerms /Mode:Install /Role:Mailbox /TargetDir:"C:\Exchange Server"
  ```

- This example installs the Mailbox server role on the local server by using the settings in the ExchangeConfig.txt file.

  ```
  Setup.exe /IAcceptExchangeServerLicenseTerms /mode:Install /role:Mailbox /AnswerFile:c:\ExchangeConfig.txt
  ```

- This example uses the domain controller named DC01 to read from and write to Active Directory while installing the Mailbox server role and the management tools on the local server.

  ```
  Setup.exe /IAcceptExchangeServerLicenseTerms /mode:Install /role:Mailbox /DomainController:DC01
  ```

- This example updates Exchange Setup with patches from the specified folder, and then installs the Mailbox server role and the management tools on the local server. In Exchange 2016 only, if any UM language packs are located in this folder, the language packs are automatically installed.

  ```
  Setup.exe /IAcceptExchangeServerLicenseTerms /role:Mailbox /UpdatesDir:"C:\ExchangeServer\New Patches"
  ```

Install Edge Transport servers in unattended mode

- This example installs the Edge Transport server role and the management tools in the default location on the local server.

  ```
  Setup.exe /IAcceptExchangeServerLicenseTerms /mode:Install /r:EdgeTransport
  ```

- This example installs the Edge Transport server role and the management tools in the specified folder on the local server.

  ```
  Setup.exe /IAcceptExchangeServerLicenseTerms /mode:Install /r:ET /TargetDir:"D:\Exchange Server"
  ```

Uninstall Exchange from servers in unattended mode

This example completely removes Exchange from the local server and removes the server's Exchange configuration from Active Directory.

```
Setup.exe /IAcceptExchangeServerLicenseTerms /mode:Uninstall
```

Remove provisioned Exchange server objects from Active Directory in unattended mode

This example removes the provisioned Exchange server object named Exchange03 from Active Directory *before* Exchange is installed on the server (if Exchange is already installed on the server, the command won't work).

```
Setup.exe /IAcceptExchangeServerLicenseTerms /rprs:Exchange03
```

For more information, see Delegate the installation of Exchange servers.

Add and remove UM language packs from existing Exchange 2016 Mailbox servers in unattended mode

> **NOTE**
>
> These procedures aren't available in Exchange 2019.

- This example installs the Russian and Spain Spanish language packs on the local Exchange 2016 Mailbox server from the specified folder.

  ```
  Setup.exe /IAcceptExchangeServerLicenseTerms /AddUmLanguagePack:ru-RU,es-ES /SourceDir:"D:\UM Language Packs"
  ```

- This example uninstalls the Korean UM language pack from the local Exchange 2016 Mailbox server.

  ```
  Setup.exe /IAcceptExchangeServerLicenseTerms /RemoveUmLanguagePack:ko-KR
  ```

Next steps

- To verify that you've successfully installed Exchange in unattended mode, see Verify Exchange Server installations.
- Complete your deployment by performing the tasks provided in Exchange post-installation tasks.
- Having problems? Ask for help in the Exchange forums. Visit the forums at Exchange Server.

Delegate the installation of Exchange servers

8/3/2020 • 4 minutes to read • Edit Online

In large companies, people who install and configure new Windows servers often aren't Exchange administrators. In Exchange 2016 and Exchange 2019, these users can still install Exchange on Windows servers, but only *after* an Exchange administrator *provisions* the Exchange server object in Active Directory. Provisioning an Exchange server object makes all of the required Active Directory changes independently of the actual installation of Exchange on a server. An Exchange administrator can provision a new Exchange server object hours or even days before Exchange is installed.

After an Exchange administrator provisions the Exchange server object, the only requirement for installing Exchange on the server is membership in the Delegated Setup role group, which allows members to install Exchange on provisioned servers. If this sounds like something you want to do, then this topic is for you.

What do you need to know before you begin?

- Estimated time to complete this procedure: Less than 10 minutes.
- You can only provision an Exchange server from the command line (Unattended Setup). You can't use the Exchange Setup wizard.
- You can't provision the first Exchange server object in your organization for the installation of Exchange by a delegate. An Exchange administrator needs to install the first Exchange server in the organization. After that, you can provision *additional* Exchange server objects so users who aren't Exchange administrators can install Exchange using delegated setup.
- A delegated user can't uninstall an Exchange server. To uninstall an Exchange server, you need to be an Exchange administrator.
- Download and use the latest available release of Updates for Exchange Server.
- To provision an Exchange server object, you need to be a member of the Organization Management role group.
- You can provision the Exchange server object in Active Directory from the target server itself, or from another computer.
- Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the Command Prompt to provision Exchange 2019 servers

1. In File Explorer, right-click on the Exchange ISO image file that you downloaded, and then select **Mount**. Note the virtual DVD drive letter that's assigned.
2. Open a Windows Command Prompt window. For example:
   - Press the Windows key + 'R' to open the **Run** dialog, type cmd.exe, and then press **OK**.
   - Press **Start**. In the **Search** box, type **Command Prompt**, then in the list of results, select **Command Prompt**.
3. In the Command Prompt window, use the following syntax:

```
<Virtual DVD drive letter>:\Setup.exe /IAcceptExchangeServerLicenseTerms /NewProvisionedServer[:
<ServerName>]
```

If you run the command on the target server, you can use the */NewProvisionedServer* switch by itself. Otherwise, you need to specify the Name of the server to provision.

This example uses the Exchange installation files on drive E: to provision the server Mailbox01:

```
E:\Setup.exe /IAcceptExchangeServerLicenseTerms /NewProvisionedServer:Mailbox01
```

This example uses the Exchange installation files on drive E: to provision the local server where you're running the command:

```
E:\Setup.exe /IAcceptExchangeServerLicenseTerms /NewProvisionedServer
```

Note: To remove a provisioned Exchange server object from Active Directory *before* Exchange is installed on it, replace the */NewProvisionedServer* switch with */RemoveProvisionedServer*.

4. Add the appropriate users to the Delegated Setup role group so they can install Exchange on the provisioned server. To add users to a role group, see Add members to a role group. The delegates can use the procedures in Install Exchange Mailbox servers using the Setup wizard to install Exchange on the provisioned server.

How do you know this worked?

To verify that you've successfully provisioned an Exchange server for a delegate installation of Exchange, do the following steps:

1. In Active Directory Users & Computers, select **Microsoft Exchange Security Groups**, double-click **Exchange Servers**, and then select the **Members** tab.

2. On the **Members** tab, verify that the provisioned server is a member of the security group. A member of the Delegated Setup role group can now install Exchange on the server.

If your server is listed as a member of the Exchange Servers security group, it was properly provisioned. Someone who's a member of the Delegated Setup role group can now install Exchange on that server.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

More information

An Exchange administrator might need to complete the deployment by performing the tasks provided in Exchange post-installation tasks.

The high-level Active Directory changes that are made when you provision an Exchange server object are described in the following list:

- A server object is created in the **CN=Servers,CN=Exchange Administrative Group (FYDIBOHF23SPDLT),CN=Administrative Groups,CN=<Organization Name>,CN=Microsoft Exchange,CN=Services,CN=Configuration,DC=<Root Domain>** configuration partition.

- The following access control entries (ACEs) are added to the server object within the configuration partition for the Delegated Setup role group:

  - Full Control on the server object and its child objects

  - Deny access control entry for the Send As extended right
  - Deny access control entry for the Receive As extended right
  - Deny CreateChild and DeleteChild permissions for Exchange Public Folder Store objects

    Note: Public folders are administered at an organizational level; therefore, the creation and deletion of public folder stores is restricted to Exchange administrators.

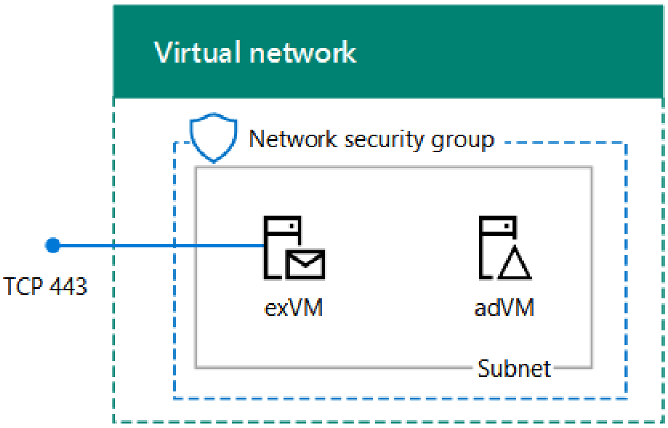
- The Active Directory computer account for the server is added to the Exchange Servers group.
- The server is added as a provisioned server in the Exchange admin center (EAC).

Only members of the Organization Management role group in Exchange have the permissions required to make these changes to Active Directory.

Exchange dev/test environments in Azure

8/3/2020 • 12 minutes to read • Edit Online

This topic steps you through creating an Exchange 2016 or Exchange 2019 dev/test deployment in Microsoft Azure. Here is the resulting configuration.



This configuration consists of a single Exchange server and a Windows Server Active Directory (AD) domain controller in a subnet of an Azure virtual network. This provides a basis and common starting point from which you can demonstrate Exchange and develop Exchange Server applications. This configuration is only for internal email and application testing on the Exchange server. No external email flow is configured.

There are three major phases to setting up this dev/test environment:

1. Set up the virtual network and domain controller (adVM).

2. Add the Exchange server (exVM).

3. Configure Exchange.

If you don't already have an Azure subscription, you can sign up for an Azure Free Trial. If you have an MSDN or Visual Studio subscription, see Monthly Azure credit for Visual Studio subscribers.

> **NOTE**
>
> Because Exchange makes changes to the schema in Windows Server AD, this configuration cannot use Azure Active Directory Domain Services.

Phase 1: Deploy the virtual network and a domain controller

You can create a new Azure virtual network with a domain controller with Azure PowerShell. You can run the following PowerShell commands from a Windows PowerShell command prompt or in the PowerShell Integrated Script Environment (ISE). If you have not installed Azure PowerShell, see Get started with Azure PowerShell cmdlets.

> **NOTE**
>
> These commands are for Azure PowerShell 1.0.0 and later.

1. Sign into your Azure account.

```
Connect-AzAccount
```

2. Get your subscription name using the following command.

   ```
   Get-AZSubscription | Sort SubscriptionName | Select SubscriptionName
   ```

3. Set your Azure subscription with the following commands. Set the `$subscr` variable by replacing everything within the quotes, including the < and > characters, with the correct name.

   ```
   $subscrName="<subscription name>"
   Select-AzSubscription -SubscriptionName $subscrName
   ```

4. Create a new resource group. To determine a unique resource group name, use this command to list your existing resource groups.

   ```
   Get-AZResourceGroup | Sort ResourceGroupName | Select ResourceGroupName
   ```

   Create your new resource group with these commands. Set the variables by replacing everything within the quotes, including the < and > characters, with the correct names.

   ```
   $rgName="<resource group name>"
   $locName="<location name, such as West US>"
   New-AZResourceGroup -Name $rgName -Location $locName
   ```

5. Resource Manager-based virtual machines require a Resource Manager-based storage account. You must pick a globally unique name for your storage account *that contains only lowercase letters and numbers*. You can use this command to list the existing storage accounts.

   ```
   Get-AZStorageAccount | Sort StorageAccountName | Select StorageAccountName
   ```

   Use this command to test whether a proposed storage account name is unique.

   ```
   Get-AZStorageAccountNameAvailability "<proposed name>"
   ```

   Create a new storage account for your new test environment with these commands.

   ```
   $rgName="<your new resource group name>"
   $saName="<storage account name>"
   $locName=(Get-AZResourceGroup -Name $rgName).Location
   New-AZStorageAccount -Name $saName -ResourceGroupName $rgName -Type Standard_LRS -Location $locName
   ```

6. Create the EXSrvrVnet Azure Virtual Network that will host the EXSrvrSubnet subnet and protect it with a network security group.

```
$rgName="<name of your new resource group>"
$locName=(Get-AZResourceGroup -Name $rgName).Location
$exSubnet=New-AZVirtualNetworkSubnetConfig -Name EXSrvrSubnet -AddressPrefix 10.0.0.0/24
New-AZVirtualNetwork -Name EXSrvrVnet -ResourceGroupName $rgName -Location $locName -AddressPrefix
10.0.0.0/16 -Subnet $exSubnet -DNSServer 10.0.0.4
$rule1 = New-AZNetworkSecurityRuleConfig -Name "RDPTraffic" -Description "Allow RDP to all VMs on the
subnet" -Access Allow -Protocol Tcp -Direction Inbound -Priority 100 -SourceAddressPrefix Internet -
SourcePortRange * -DestinationAddressPrefix * -DestinationPortRange 3389
$rule2 = New-AZNetworkSecurityRuleConfig -Name "ExchangeSecureWebTraffic" -Description "Allow HTTPS to
the Exchange server" -Access Allow -Protocol Tcp -Direction Inbound -Priority 101 -SourceAddressPrefix
Internet -SourcePortRange * -DestinationAddressPrefix "10.0.0.5/32" -DestinationPortRange 443
New-AZNetworkSecurityGroup -Name EXSrvrSubnet -ResourceGroupName $rgName -Location $locName -
SecurityRules $rule1, $rule2
$vnet=Get-AZVirtualNetwork -ResourceGroupName $rgName -Name EXSrvrVnet
$nsg=Get-AZNetworkSecurityGroup -Name EXSrvrSubnet -ResourceGroupName $rgName
Set-AZVirtualNetworkSubnetConfig -VirtualNetwork $vnet -Name EXSrvrSubnet -AddressPrefix "10.0.0.0/24" -
NetworkSecurityGroup $nsg
$vnet | Set-AzVirtualNetwork
```

7. Create the adVM virtual machine in Azure. adVM is a domain controller for the corp.contoso.com Windows Server AD domain and a DNS server for the virtual machines of the EXSrvrVnet virtual network.

   First, fill in the name of your resource group, Azure location, and storage account name and run these commands at the Azure PowerShell command prompt on your local computer to create an Azure virtual machine for adVM.

```
$rgName="<resource group name>"
# Create an availability set for domain controller virtual machines
New-AZAvailabilitySet -ResourceGroupName $rgName -Name dcAvailabilitySet -Location $locName -Sku Aligned
-PlatformUpdateDomainCount 5 -PlatformFaultDomainCount 2
# Create the domain controller virtual machine
$vnet=Get-AZVirtualNetwork -Name EXSrvrVnet -ResourceGroupName $rgName
$pip = New-AZPublicIpAddress -Name adVM-NIC -ResourceGroupName $rgName -Location $locName -
AllocationMethod Dynamic
$nic = New-AZNetworkInterface -Name adVM-NIC -ResourceGroupName $rgName -Location $locName -SubnetId
$vnet.Subnets[0].Id -PublicIpAddressId $pip.Id -PrivateIpAddress 10.0.0.4
$avSet=Get-AZAvailabilitySet -Name dcAvailabilitySet -ResourceGroupName $rgName
$vm=New-AZVMConfig -VMName adVM -VMSize Standard_D1_v2 -AvailabilitySetId $avSet.Id
$vm=Set-AZVMOSDisk -VM $vm -Name adVM-OS -DiskSizeInGB 128 -CreateOption FromImage -StorageAccountType
"Standard_LRS"
$diskConfig=New-AZDiskConfig -AccountType "Standard_LRS" -Location $locName -CreateOption Empty -
DiskSizeGB 20
$dataDisk1=New-AZDisk -DiskName adVM-DataDisk1 -Disk $diskConfig -ResourceGroupName $rgName
$vm=Add-AZVMDataDisk -VM $vm -Name adVM-DataDisk1 -CreateOption Attach -ManagedDiskId $dataDisk1.Id -Lun
1
$cred=Get-Credential -Message "Type the name and password of the local administrator account for adVM."
$vm=Set-AZVMOperatingSystem -VM $vm -Windows -ComputerName adVM -Credential $cred -ProvisionVMAgent -
EnableAutoUpdate
$vm=Set-AZVMSourceImage -VM $vm -PublisherName MicrosoftWindowsServer -Offer WindowsServer -Skus 2012-
R2-Datacenter -Version "latest"
$vm=Add-AZVMNetworkInterface -VM $vm -Id $nic.Id
New-AZVM -ResourceGroupName $rgName -Location $locName -VM $vm
```

You will be prompted for a username and password. This article will refer to this username as ADMIN_NAME. Use a strong password and record both in a secure location.

Note: The password that you specify cannot be "pass@word1". It must be between 8-123 characters long and must satisfy at least 3 of the following password complexity requirements:

- Contains an uppercase letter
- Contains an lowercase letter

- Contains a numeric digit
- Contains a special character

It can take a few minutes for Azure to build the virtual machine.

Connect to the domain controller virtual machine using local administrator account credentials

1. In the Azure portal, click **Resource Groups > <your resource group name>> adVM > Connect**.
2. Run the adVM.rdp file that is downloaded, and then click **Connect**.
3. In **Windows Security**, click **Use another account**. In **User name**, type **adVM**<ADMIN_NAME>.
4. In **Password**, type the password of the ADMIN_NAME account, and then click **OK**.
5. When prompted, click **Yes**.
6. Add an extra data disk as a new volume with the drive letter F: with these commands at an administrator-level Windows PowerShell command prompt on adVM.

```
$disk=Get-Disk | where {$_.PartitionStyle -eq "RAW"}
$diskNumber=$disk.Number
Initialize-Disk -Number $diskNumber
New-Partition -DiskNumber $diskNumber -UseMaximumSize -AssignDriveLetter
Format-Volume -DriveLetter F
```

7. Configure adVM as a domain controller and DNS server for the corp.contoso.com domain. Run these commands at an administrator-level Windows PowerShell command prompt on adVM.

```
Install-WindowsFeature AD-Domain-Services -IncludeManagementTools
Install-ADDSForest -DomainName corp.contoso.com -DatabasePath "F:\NTDS" -SysvolPath "F:\SYSVOL" -LogPath
"F:\Logs"
```

Note that these commands can take a few minutes to complete.

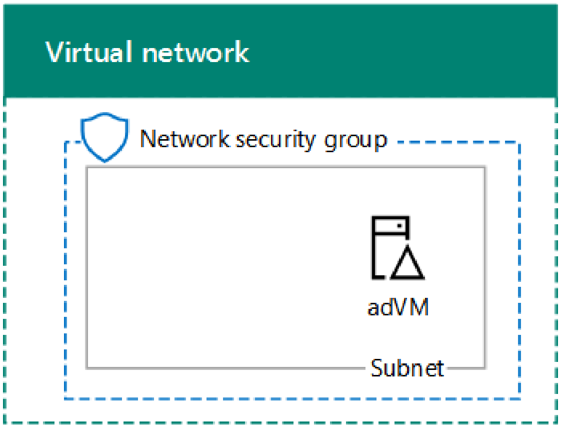
After adVM restarts, reconnect to the adVM virtual machine.

Connect to the domain controller virtual machine using domain credentials

1. In the Azure portal, click **Resource Groups >** <the name of your new resource group> **> adVM > Connect**.
2. Run the adVM.rdp file that is downloaded, and then click **Connect**.
3. In **Windows Security**, click **Use another account**. In **User name**, type **CORP**<ADMIN_NAME>.
4. In **Password**, type the password of the ADMIN_NAME account, and then click **OK**.
5. When prompted, click **Yes**.
6. From the desktop, open an administrator-level Windows PowerShell command prompt and run the following command:

```
Add-WindowsFeature RSAT-ADDS-Tools
```

Here is the result of Phase 1.



Phase 2: Create the Exchange virtual machine

In this phase, you create an Exchange virtual machine in the EXSrvrVNet virtual network and make it a member of the CORP domain.

To create the Exchange virtual machine with Azure PowerShell, first log in to Azure with your Azure account from the Windows PowerShell command prompt (if needed).

```
Connect-AzAccount
```

You must determine a globally unique DNS name for the exVM virtual machine. You must pick a globally unique DNS name *that contains only lowercase letters and numbers*. You can do this with the following PowerShell commands:

```
$vmDNSName="<DNS name to test>"
$rgName="<resource group name>"
$locName=(Get-AZResourceGroup -Name $rgName).Location
Test-AZDnsAvailability -DomainQualifiedName $vmDNSName -Location $locName
```

If you see "True", your proposed name is globally unique.

Next, fill in the variable values and run the resulting block at the PowerShell prompt.

```
# Set up key variables
$subscrName="<name of your Azure subscription>"
$rgName="<your resource group name>"
$vmDNSName="<unique, public DNS name for the Exchange server>"
# Set the Azure subscription
Select-AzSubscription -SubscriptionName $subscrName
# Get the Azure location and storage account names
$locName=(Get-AZResourceGroup -Name $rgName).Location
$saName=(Get-AZStorageaccount | Where {$_.ResourceGroupName -eq $rgName}).StorageAccountName
# Create an availability set for Exchange virtual machines
New-AZAvailabilitySet -ResourceGroupName $rgName -Name exAvailabilitySet -Location $locName -Sku Aligned  -
PlatformUpdateDomainCount 5 -PlatformFaultDomainCount 2
# Specify the virtual machine name and size
$vmName="exVM"
$vmSize="Standard_D3_v2"
$vnet=Get-AZVirtualNetwork -Name "EXSrvrVnet" -ResourceGroupName $rgName
$avSet=Get-AZAvailabilitySet -Name exAvailabilitySet -ResourceGroupName $rgName
$vm=New-AZVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avSet.Id
# Create the NIC for the virtual machine
$nicName=$vmName + "-NIC"
$pipName=$vmName + "-PublicIP"
$pip=New-AZPublicIpAddress -Name $pipName -ResourceGroupName $rgName -DomainNameLabel $vmDNSName -Location
$locName -AllocationMethod Dynamic
$nic=New-AZNetworkInterface -Name $nicName -ResourceGroupName $rgName -Location $locName -SubnetId
$vnet.Subnets[0].Id -PublicIpAddressId $pip.Id -PrivateIpAddress "10.0.0.5"
# Create and configure the virtual machine
$cred=Get-Credential -Message "Type the name and password of the local administrator account for exVM."
$vm=Set-AZVMOSDisk -VM $vm -Name ($vmName +"-OS") -DiskSizeInGB 128 -CreateOption FromImage -
StorageAccountType "Standard_LRS"
$vm=Set-AZVMOperatingSystem -VM $vm -Windows -ComputerName $vmName -Credential $cred -ProvisionVMAgent -
EnableAutoUpdate
$vm=Set-AZVMSourceImage -VM $vm -PublisherName MicrosoftWindowsServer -Offer WindowsServer -Skus 2019-
Datacenter -Version "latest"
$vm=Add-AZVMNetworkInterface -VM $vm -Id $nic.Id
New-AZVM -ResourceGroupName $rgName -Location $locName -VM $vm
```

NOTE

This command block uses a standard storage account created in phase 1 to reduce costs for this dev/test environment. For a production Exchange server, you must use a premium storage account.

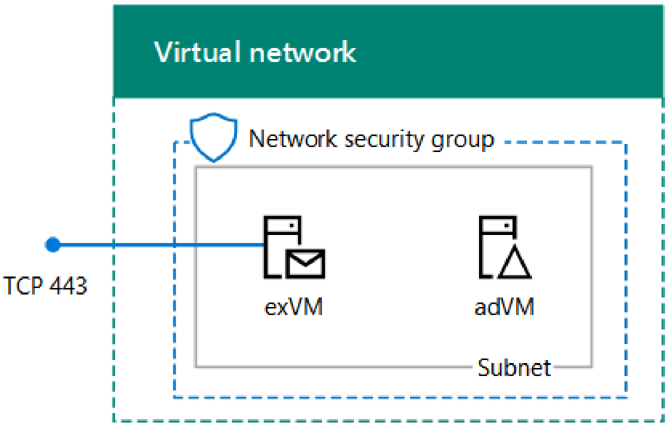
From the Azure portal, connect to the exVM virtual machine using the credentials of the local administrator account.

Next, join exVM to the Windows AD domain with these commands at a Windows PowerShell prompt.

```
Add-Computer -DomainName "corp.contoso.com"
Restart-Computer
```

Note that you must supply domain account credentials after entering the **Add-Computer** command. Use the CORP\<ADMIN_NAME> account and password.

Here is the result of Phase 2.



Phase 3: Configure Exchange

In this phase, you configure Exchange on exVM and test mail delivery between two mailboxes.

Prepare Windows Server AD

1. At the PowerShell command prompt on your local computer, run the following command:

```
Write-Host (Get-AZPublicIpaddress -Name "exVM-PublicIP" -ResourceGroup $rgName).DnsSettings.Fqdn
```

2. Note or copy the full DNS name from the display of the command. This is the Internet DNS name of the exVM virtual machine. You will need this value later.

3. If needed, connect to the adVM virtual machine with the Azure portal using the CORP\<ADMIN_NAME> account and password.

4. From the Start screen of adVM, type **Active Directory**, and then click **Active Directory Domains and Trusts**.

5. Right-click **Active Directory Domains and Trusts**, and then click **Properties**.

6. In **Alternative UPN suffixes**, type or copy the Internet DNS name of the exVM virtual machine from step 2, click **Add**, and then click **OK**.

7. Close the remote desktop session with adVM.

Install Exchange

1. Connect to the exVM virtual machine with the Azure portal using the CORP\<ADMIN_NAME> account and password.

2. From exVM, open an administrator-level Windows PowerShell command prompt and run the following commands.

```
Install-WindowsFeature NET-Framework-45-Features, RPC-over-HTTP-proxy, RSAT-Clustering, RSAT-Clustering-CmdInterface, RSAT-Clustering-Mgmt, RSAT-Clustering-PowerShell, Web-Mgmt-Console, WAS-Process-Model, Web-Asp-Net45, Web-Basic-Auth, Web-Client-Auth, Web-Digest-Auth, Web-Dir-Browsing, Web-Dyn-Compression, Web-Http-Errors, Web-Http-Logging, Web-Http-Redirect, Web-Http-Tracing, Web-ISAPI-Ext, Web-ISAPI-Filter, Web-Lgcy-Mgmt-Console, Web-Metabase, Web-Mgmt-Console, Web-Mgmt-Service, Web-Net-Ext45, Web-Request-Monitor, Web-Server, Web-Stat-Compression, Web-Static-Content, Web-Windows-Auth, Web-WMI, Windows-Identity-Foundation, RSAT-ADDS-Tools
Restart-Computer
```

3. Connect to the exVM virtual machine with the Azure portal using the CORP\<ADMIN_NAME> account and password.

4. From Server Manager, click **Local Server**. In the **Properties** for exVM, click **On** for **IE Enhanced Security Configuration**. In **Internet Explorer Enhanced Security Configuration**, click **Off** for both Administrators and Users, and then click **OK**.

5. From the Start screen, click **Internet Explorer**, and then download the Unified Communications Managed API 4.0 Runtime from https://www.microsoft.com/download/details.aspx?id=34992. When prompted, click **Run**.

6. When prompted with the Microsoft Unified Communications Managed API 4.0, Runtime Setup, click **Next**.

7. Click **I have read and accept the license terms**, and then click **Install**. On the **Installation is Complete** page, click **Finish**.

8. From Internet Explorer, download the latest version of Exchange. For more information, see Updates for Exchange Server.

9. Click **Save** to store the ISO file in the Downloads folder.

10. Click **Open Folder**, right-click the Exchange ISO file, and then click **Mount**.

11. From an administrator-level Windows PowerShell command prompt on exVM, run the following:

```
e:
.\setup.exe /mode:Install /role:Mailbox /OrganizationName:Contoso /IacceptExchangeServerLicenseTerms
Restart-Computer
```

Wait until Exchange setup completes, which can take some time, and exVM restarts.

Add two mailboxes to the Exchange server

1. Connect to the exVM virtual machine with the Azure portal using the CORP\<ADMIN_NAME> account and password.

2. From the Start screen, type **Exchange**, and then click **Exchange Management Shell**.

3. Copy the following commands to Notepad, insert the Internet DNS name of the exVM virtual machine for the **$dnsName** variable, and then copy and paste the resulting commands into the Exchange Management Shell.

```
$dnsName="<Internet DNS name of the exVM virtual machine>"
$user1Name="chris@" + $dnsName
$user2Name="janet@" + $dnsName
$db=Get-MailboxDatabase
$dbName=$db.Name
$password = Read-Host "Enter password" -AsSecureString
```

4. Record the password specified in a safe place. Next, run these commands to create two mailboxes.

```
New-Mailbox -UserPrincipalName $user1Name -Alias chris -Database $dbName -Name ChrisAshton -
OrganizationalUnit Users -Password $password -FirstName Chris -LastName Ashton -DisplayName "Chris
Ashton"
New-Mailbox -UserPrincipalName $user2Name -Alias janet -Database $dbName -Name JanetSchorr -
OrganizationalUnit Users -Password $password -FirstName Janet -LastName Schorr -DisplayName "Janet
Schorr"
```

Test email delivery between mailboxes

1. From the browser on your local computer, access the web site **https://**<Internet DNS name of the exVM virtual machine> **/owa**. When prompted with an error page for the website's security certificate, click

Continue to this website. On the Outlook sign-in page, use the corp\chris account name with its password.

2. When prompted to specify the language and time zone, select the appropriate value for each, and then click **Save**.
3. From Chris Ashton's inbox, click **New**. In **To**, type **janet** and then click **Search Directory**. For **Subject**, type **Test message**, and then click **Send**.
4. Click the user icon in the upper right part of the Mail web page, and then click **Sign out**.
5. On the Outlook sign-in page, use the corp\janet account name with its password. When prompted to specify the language and time zone, select the appropriate value for each, and then click **Save**.
6. Verify that the inbox contains the test message from Chris Ashton. Click it, then click **Reply all**. In the body of the message, type **Replied**, and then click **Send**.
7. Click the user icon in the upper right part of the Mail web page, and then click **Sign out**.
8. On the Outlook sign-in page, use the corp\chris account name with its password. Verify that the reply email message sent from Janet is in the inbox.

You are now ready to test Exchange features or applications.

Stop and start the virtual machines

Azure virtual machines incur an ongoing cost when they are running. To help minimize the cost of your Exchange dev/test environment, use these commands to stop the virtual machines:

```
$rgName="<your resource group name>"
Stop-AZVM -Name exVM -ResourceGroupName $rgName -Force
Stop-AZVM -Name adVM -ResourceGroupName $rgName -Force
```

To start them again, use these commands:

```
$rgName="<your resource group name>"
Start-AZVM -Name adVM -ResourceGroupName $rgName
Start-AZVM -Name exVM -ResourceGroupName $rgName
```

Upgrade Exchange to the latest Cumulative Update

8/3/2020 • 4 minutes to read • Edit Online

If you have Exchange Server 2016 or Exchange Server 2019 installed, you can upgrade the Exchange servers to the latest Cumulative Update (CU). Because each CU is a full installation of Exchange that includes updates and changes from all previous CUs, you don't need to install any previous CUs or Exchange 2016 RTM or Exchange 2019 RTM first. For more information about the latest available Exchange CUs, see Updates for Exchange Server.

Caution

After you upgrade Exchange to a newer CU, you can't uninstall the new version to revert to the previous version. Uninstalling the new version completely removes Exchange from the server.

What do you need to know before you begin?

- Estimated time to complete: 60 minutes
- The account that you'll use to install the CU requires membership in the Exchange Organization Management role group. If the CU requires Active Directory schema updates or domain preparation, the account will likely require additional permissions. For more information, see Prepare Active Directory and domains for Exchange Server.
- Check the Release notes before you install the CU.
- Verify the target server meets the potentially new system requirements and prerequisites for the CU. For more information, see Exchange Server system requirements and Exchange Server prerequisites.

  Caution

  Any customized Exchange or Internet Information Server (IIS) settings that you made in Exchange XML application configuration files on the Exchange server (for example, web.config files or the EdgeTransport.exe.config file) **will be overwritten** when you install an Exchange CU. Be sure save this information so you can easily re-apply the settings after the install. After you install the Exchange CU, you need to re-configure these settings.
- After you install an Exchange CU, you need to restart the computer so that changes can be made to the registry and operating system.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

Best Practices

- Always keep your servers as up to date as possible. This especially applies to the installation of a new server.
- Always install the latest Cumulative Update when creating a new server.
- There is no need to install the RTM build or previous builds and then upgrade to the latest Cumulative Update. This is because each Cumulative Update is a full build of the product.
- Reboot the server beforehand.
- Test the new update in a non-production environment first to avoid any problems in the new update affecting the running production environment.

- Have a tested and working backup of both the Active Directory and your Exchange Server.
- Backup any and all customizations. They will not survive the update.
- Use an elevated command prompt to run the Cumulative Update.
- Temporarily disable any anti-virus software during the update process.
- Reboot your server upon completion of the update.

Install an Exchange CU using the Setup wizard

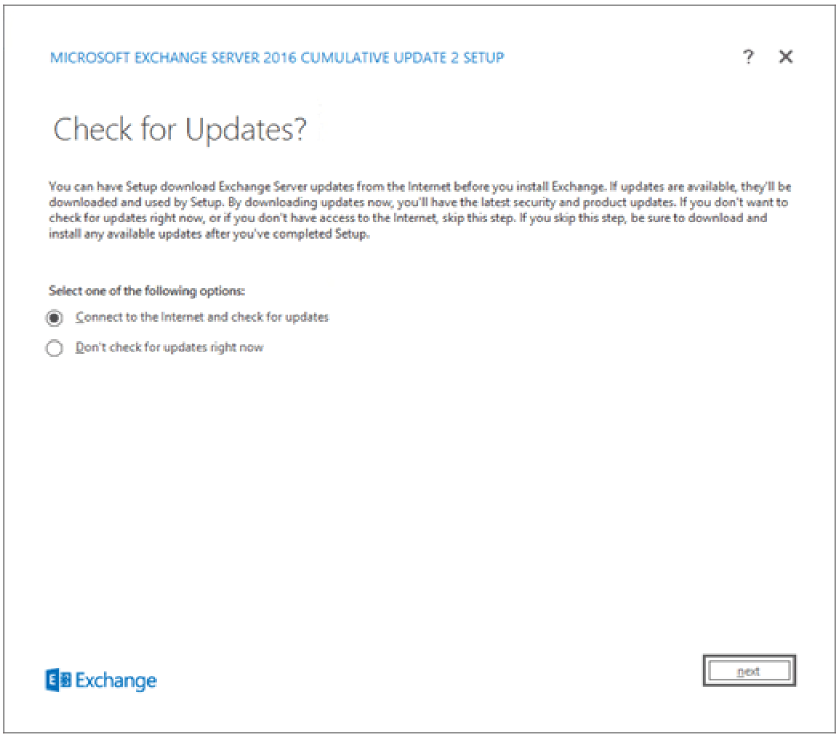
1. Download the latest version of Exchange on the target computer. For more information, see Updates for Exchange Server.

2. In File Explorer, right-click on the Exchange CU ISO image file that you downloaded, and then select **Mount**. In the resulting virtual DVD drive that appears, start Exchange Setup by double-clicking `Setup.exe`.

3. The Exchange Server Setup wizard opens. On the **Check for Updates?** page, choose one of the following options, and then click **Next** to continue:

   - **Connect to the Internet and check for updates**: We recommend this option, which searches for updates to the version of Exchange *that you're currently installing* (it doesn't detect newer CUs). This option takes you to the **Downloading Updates** page that searches for updates. Click **Next** to continue.

   - **Don't check for updates right now**



MICROSOFT EXCHANGE SERVER 2016 CUMULATIVE UPDATE 2 SETUP

Check for Updates?

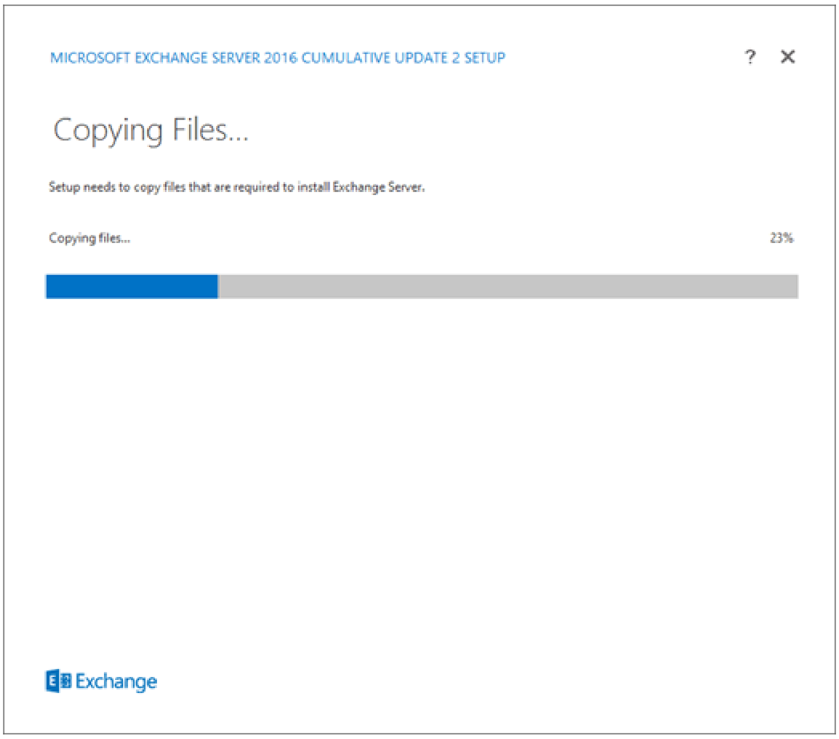
You can have Setup download Exchange Server updates from the Internet before you install Exchange. If updates are available, they'll be downloaded and used by Setup. By downloading updates now, you'll have the latest security and product updates. If you don't want to check for updates right now, or if you don't have access to the Internet, skip this step. If you skip this step, be sure to download and install any available updates after you've completed Setup.

Select one of the following options:

● Connect to the Internet and check for updates

○ Don't check for updates right now

4. The **Copying Files** page shows the progress of copying files to the local hard drive. Typically, the files are copied to `%WinDir%\Temp\ExchangeSetup`, but you can confirm the location in the Exchange Setup log at `C:\ExchangeSetupLogs\ExchangeSetup.log`.



MICROSOFT EXCHANGE SERVER 2016 CUMULATIVE UPDATE 2 SETUP

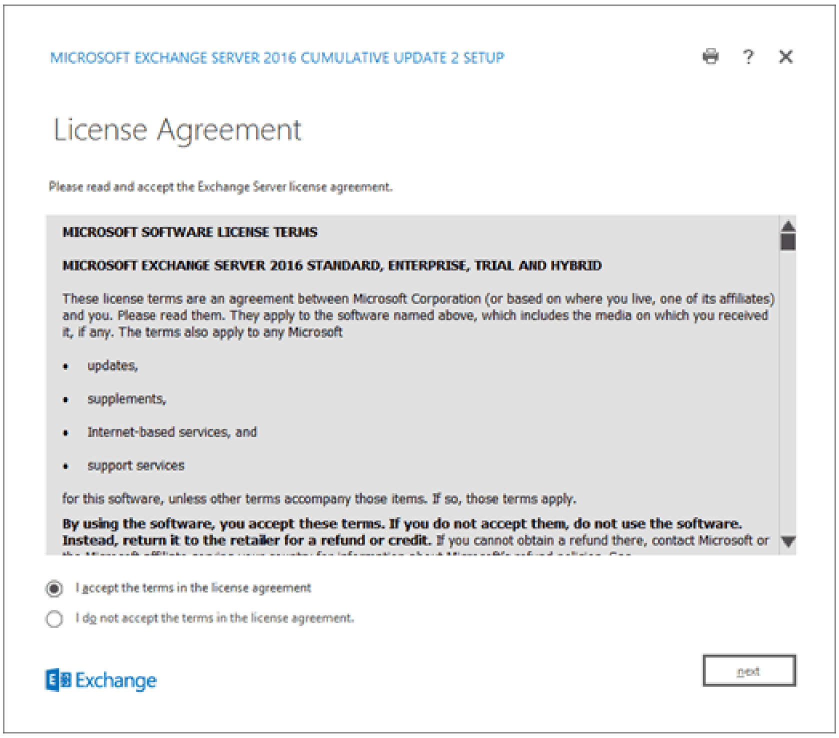
Copying Files...

Setup needs to copy files that are required to install Exchange Server.

Copying files... 23%

5. The **Upgrade** page shows that Setup detected the existing installation of Exchange, so you're upgrading Exchange on the server (not installing a new Exchange server). Click **Next** to continue.

6. On the **License Agreement** page, review the software license terms, select **I accept the terms in the license agreement**, and then click **Next** to continue.



MICROSOFT EXCHANGE SERVER 2016 CUMULATIVE UPDATE 2 SETUP

License Agreement

Please read and accept the Exchange Server license agreement.

MICROSOFT SOFTWARE LICENSE TERMS

MICROSOFT EXCHANGE SERVER 2016 STANDARD, ENTERPRISE, TRIAL AND HYBRID

These license terms are an agreement between Microsoft Corporation (or based on where you live, one of its affiliates) and you. Please read them. They apply to the software named above, which includes the media on which you received it, if any. The terms also apply to any Microsoft

- updates,
- supplements,
- Internet-based services, and
- support services

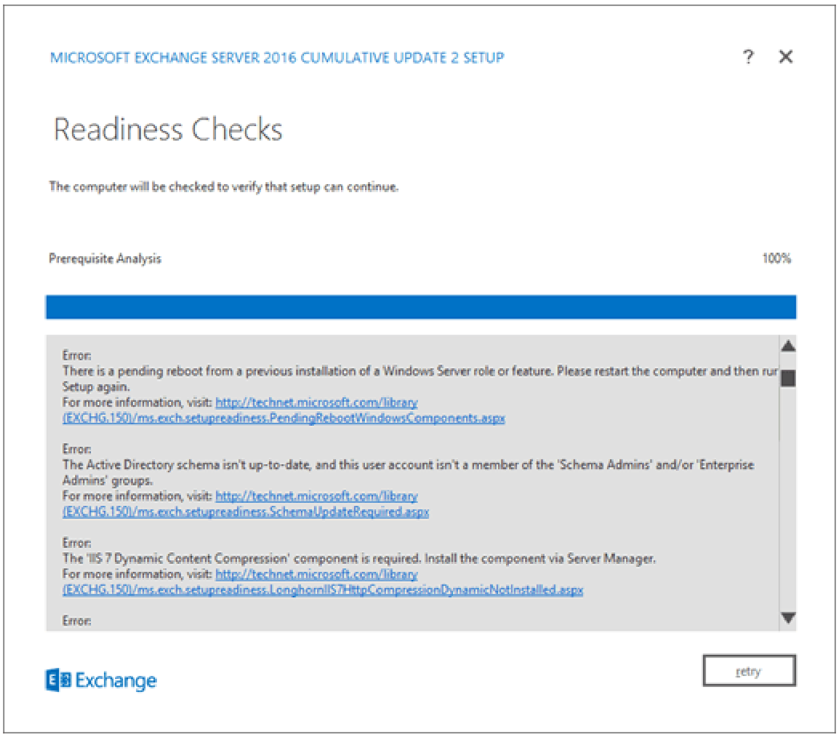
for this software, unless other terms accompany those items. If so, those terms apply.

By using the software, you accept these terms. If you do not accept them, do not use the software. Instead, return it to the retailer for a refund or credit. If you cannot obtain a refund there, contact Microsoft or

● I accept the terms in the license agreement

○ I do not accept the terms in the license agreement.

7. On the **Readiness Checks** page, verify that the prerequisite checks completed successfully. If they haven't, the only option on the page is **Retry**, so you need to resolve the errors before you can continue.



Readiness Checks

The computer will be checked to verify that setup can continue.

Prerequisite Analysis 100%

Error:
There is a pending reboot from a previous installation of a Windows Server role or feature. Please restart the computer and then rur
Setup again.
For more information, visit: http://technet.microsoft.com/library
(EXCHG.150)/ms.exch.setupreadiness.PendingRebootWindowsComponents.aspx

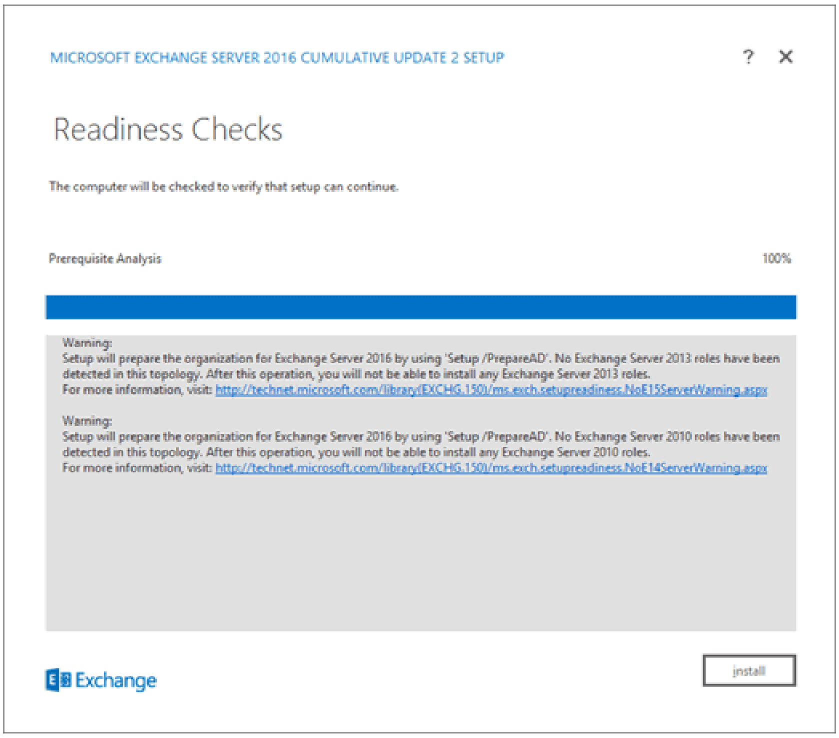
Error:
The Active Directory schema isn't up-to-date, and this user account isn't a member of the 'Schema Admins' and/or 'Enterprise
Admins' groups.
For more information, visit: http://technet.microsoft.com/library
(EXCHG.150)/ms.exch.setupreadiness.SchemaUpdateRequired.aspx

Error:
The 'IIS 7 Dynamic Content Compression' component is required. Install the component via Server Manager.
For more information, visit: http://technet.microsoft.com/library
(EXCHG.150)/ms.exch.setupreadiness.LonghornIIS7HttpCompressionDynamicNotInstalled.aspx

Error:

After you resolve the errors, click **Retry** to run the prerequisite checks again. You can fix some errors without exiting Setup, while the fix for other errors requires you to restart the computer. If you restart the computer, you need to start over at Step 1.

When no more errors are detected on the **Readiness Checks** page, the **Retry** button changes to **Install** so you can continue. Be sure to review any warnings, and then click **Install** to install Exchange.



Readiness Checks

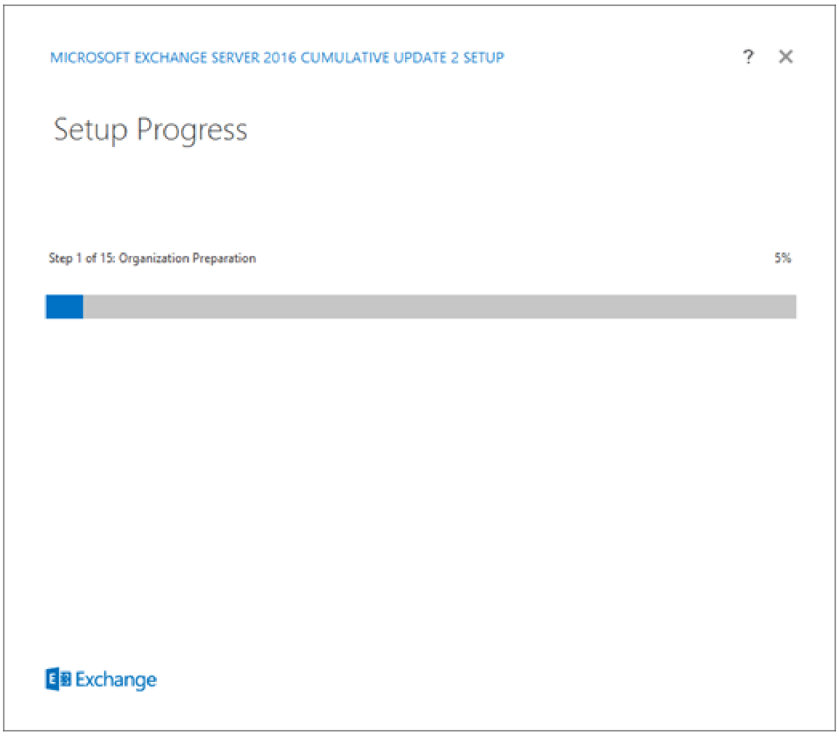
The computer will be checked to verify that setup can continue.

Prerequisite Analysis 100%

Warning:
Setup will prepare the organization for Exchange Server 2016 by using 'Setup /PrepareAD'. No Exchange Server 2013 roles have been detected in this topology. After this operation, you will not be able to install any Exchange Server 2013 roles.
For more information, visit: http://technet.microsoft.com/library(EXCHG.150)/ms.exch.setupreadiness.NoE15ServerWarning.aspx

Warning:
Setup will prepare the organization for Exchange Server 2016 by using 'Setup /PrepareAD'. No Exchange Server 2010 roles have been detected in this topology. After this operation, you will not be able to install any Exchange Server 2010 roles.
For more information, visit: http://technet.microsoft.com/library(EXCHG.150)/ms.exch.setupreadiness.NoE14ServerWarning.aspx

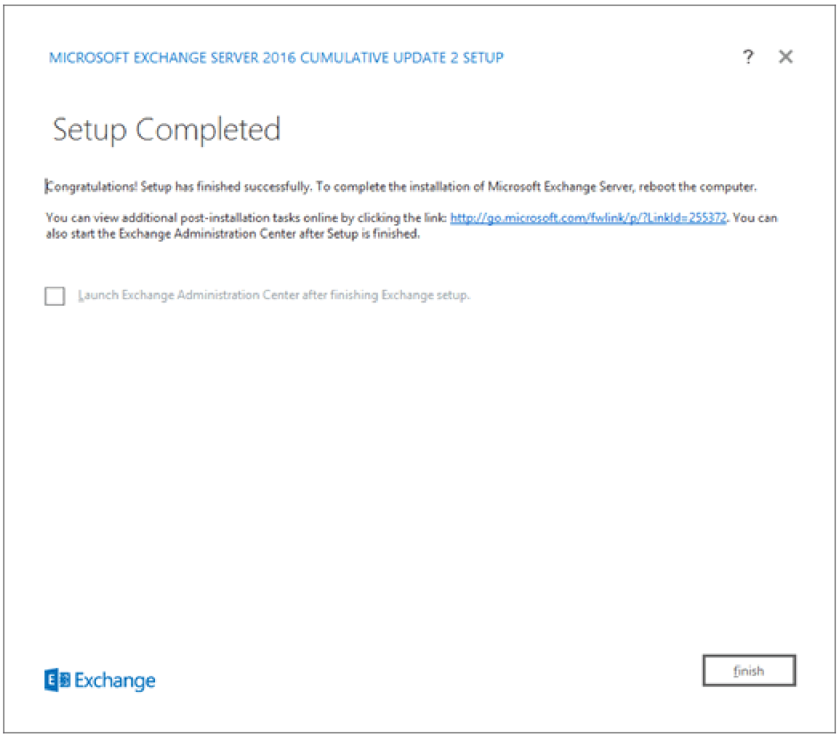
8. On the **Setup Progress** page, a progress bar indicates how the installation is proceeding.



Setup Progress

Step 1 of 15: Organization Preparation 5%

9. On the **Setup Completed** page, click **Finish**, and then restart the computer.



Setup Completed

Congratulations! Setup has finished successfully. To complete the installation of Microsoft Exchange Server, reboot the computer.

You can view additional post-installation tasks online by clicking the link: http://go.microsoft.com/fwlink/p/?LinkId=255372. You can also start the Exchange Administration Center after Setup is finished.

□ Launch Exchange Administration Center after finishing Exchange setup.

Install an Exchange CU using unattended Setup from the command line

To install an Exchange CU from the command line, use the following syntax:

```
<Virtual DVD drive letter>:\Setup.exe /IAcceptExchangeServerLicenseTerms /Mode:Upgrade [/DomainController:
<ServerFQDN>] [/EnableErrorReporting]
```

Notes:

- The optional */DomainController* switch specifies the domain controller that Setup uses to read from an write to Active Directory.

- The optional */EnableErrorReporting* switch enables Setup to automatically submit critical error reports to Microsoft. Microsoft uses this information to diagnose problems and provide solutions.

This example uses the Exchange CU files on drive E: to install the CU on the local server, and uses the domain controller dc01.contoso.com to read from and write to Active Directory.

```
E:\Setup.exe /IAcceptExchangeServerLicenseTerms /Mode:Upgrade /DomainController:dc01.contoso.com
```

For more information about unattended Setup from the command line, see Install Exchange using unattended mode.

How do you know this worked?

To verify that you've successfully installed an Exchange CU, see Verify Exchange Server installations.

Exchange Server supportability matrix

8/3/2020 • 12 minutes to read • Edit Online

The Exchange Server supportability matrix provides a central source for Exchange administrators to easily locate information about the level of support available for any configuration or required component for supported versions of Microsoft Exchange Server.

Release model

The following table identifies the release model for each supported version of Exchange.

In Exchange Server 2010 and earlier, each update rollup package (RU) is cumulative. An RU for Exchange Server 2010 includes all fixes for Exchange Server from all previous update rollup packages, so you only need to install the latest RU to apply all of the fixes that were released up to that point. However, individual updates or hotfixes for Exchange 2010 or earlier do not contain all previous fixes for Exchange Server. The updated files that are included in an individual update or hotfix include all updates that were applied only to those specific files by all previous updates, but any other files on Exchange Server will not be updated. For more information, see Exchange 2010 Servicing.

In Exchange Server 2013 or later, we changed the way we deliver hotfixes and service packs by using a scheduled delivery model. In this model, cumulative updates (CUs) are released quarterly (every three months). Each CU is a full installation of Exchange that includes updates and changes from all previous CUs, so you don't need to install any previous CUs or Exchange Server RTM first. For more information, see Updates for Exchange Server.

SERVICING RELEASE MODEL	EXCHANGE 2019	EXCHANGE 2016	EXCHANGE 2013	EXCHANGE 2010
Cumulative updates (CUs)	Yes	Yes	Yes	No
Update rollups (RUs)	No	No	No	Yes
Security hotfixes delivered separately	Yes	Yes	Yes	No

NOTE

At this time, no additional CUs are planned for Exchange Server 2013 and no additional RUs are planned for Exchange Server 2010.

Support lifecycle

For more information about the support lifecycle for specific versions of Exchange, Windows Server, or Windows client operating systems, see the Microsoft Support Lifecycle page. For more information about the Microsoft Support Lifecycle, see the Microsoft Support Lifecycle Policy FAQ.

Exchange Server 2007 End-of life

Exchange 2007 reached end of support on April 11, 2017, per the Microsoft Lifecycle Policy. There will be no new security updates, non-security updates, free or paid assisted support options, or online technical content updates.

Furthermore, as adoption of Microsoft 365 or Office 365 accelerates and cloud usage increases, custom support options for Office products will not be available. This includes Exchange Server, as well as Microsoft Office, SharePoint Server, Office Communications Server, Lync Server, Skype for Business Server, Project Server, and Visio. At this time, we encourage customers to complete their migration and upgrade plans. We recommend that customers leverage deployment benefits provided by Microsoft and Microsoft Certified Partners including Microsoft FastTrack for cloud migrations, and Software Assurance Planning Services for on-premises upgrades.

Supported operating system platforms

The following tables identify the operating system platforms on which each version of Exchange can run.

IMPORTANT

Releases of Windows Server and Windows client that aren't listed in the tables below are not supported for use with any version or release of Exchange.

SERVER OPERATING SYSTEM	EXCHANGE 2019	EXCHANGE 2016 CU3 AND LATER	EXCHANGE 2016 CU2 AND EARLIER	EXCHANGE 2013 SP1 AND LATER	EXCHANGE 2010 SP3
Windows Server 2019	Supported	Not supported	Not supported	Not supported	Not supported

Web browsers supported for use with the premium version of Outlook Web App or Outlook on the web

The following table identifies the web browsers supported for use together with the premium version of Outlook Web App or Outlook on the web.

BROWSER	EXCHANGE 2019	EXCHANGE 2016	EXCHANGE 2013 SP1 AND LATER	EXCHANGE 2010 SP3
Microsoft Edge	Supported	Supported	Not supported	Not supported
Internet Explorer 11	Supported	Supported	Supported	Supported
Internet Explorer 10	Not supported	Not supported	Supported	Supported
Internet Explorer 9	Not supported	Not supported	Supported	Supported
Internet Explorer 8	Not supported	Not supported	Supported	Supported
Internet Explorer 7	Not supported	Not supported	Not supported	Supported
Firefox	Current release of Firefox*	Current release of Firefox*	Not supported	Not supported
Firefox 3.0.1 or later	Not supported	Not supported	Not supported	Supported
Firefox 12 or later	Not supported	Not supported	Supported	Supported
Safari	Current release of Safari	Current release of Safari	Not supported	Not supported
Safari 3.1 or later	Not supported	Not supported	Not supported	Supported
Safari 5.0 or later	Not supported	Not supported	Supported	Supported
Chrome	Current release of Chrome*	Current release of Chrome*	Not supported	Not supported
Chrome 3.0.195 or later	Not supported	Not supported	Not supported	Supported
Chrome 18 or later	Not supported	Not supported	Supported	Supported

* Current release of Firefox or Chrome refers to the latest version or the immediately previous version.

Web browsers supported for use with the basic version of Outlook Web App or Outlook on the web

The following table identifies the web browsers supported for use together with the light (basic) version of Outlook Web App or Outlook on the web.

NOTE

Outlook Web App Basic (Outlook Web App Light) is supported for use in mobile browsers. However, if rendering or authentication issues occur in a mobile browser, determine whether the issue can be reproduced by using Outlook Web App Light in the full client of a supported browser. For example, test the use of Outlook Web App Light in Safari, Chrome, or Internet Explorer. If the issue can't be reproduced in the full client, we recommend that you contact the mobile device vendor for help. In these cases, we collaborate with the vendor as appropriate.

BROWSER	EXCHANGE 2019	EXCHANGE 2016	EXCHANGE 2013	EXCHANGE 2010 SP3
Microsoft Edge	Supported	Supported	Not supported	Not supported
Internet Explorer 11	Supported	Supported	Supported	Supported

Outlook for Mac for Office 365	Not supported	Supported[1]	Supported	Supported
Entourage 2008 (EWS)	Not supported	Supported[4]	Supported[4]	Supported[4]

[1] Requires the latest Office service pack and the latest public update.

[2] Requires Outlook 2010 Service Pack 1 and the latest public update.

[3] Requires Outlook 2007 Service Pack 3 and the latest public update.

[4] EWS only. There is no DAV support for Exchange 2010.

Microsoft .NET Framework

The following tables identify the versions of the Microsoft .NET Framework that can be used with the specified versions of Exchange.

IMPORTANT

Versions of the .NET Framework that aren't listed in the tables below are not supported on any version of Exchange. This includes minor and patch-level releases of the .NET Framework.

If you are upgrading Exchange Server from an unsupported CU to the current CU and no intermediate CUs are available, you should first upgrade to the latest version of .NET that's supported by your version of Exchange Server and then immediately upgrade to the current CU. This method doesn't replace the need to keep your Exchange servers up to date and on the latest supported CU. Microsoft makes no claim that an upgrade failure will not occur using this method, which may result in the need to contact Microsoft Support Services.

Exchange 2019

.NET FRAMEWORK VERSION	CU6, CU5, CU4	CU3, CU2	CU1, RTM
4.8	Supported	Supported	Not supported
4.7.2	Not supported	Supported	Supported

* .NET Framework 4.6.1 also requires a hotfix, and a different hotfix is required for different versions of Windows. For more information, see Released: June 2016 Quarterly Exchange Updates.

Exchange 2010 SP3

.NET FRAMEWORK VERSION	EXCHANGE 2010 SP3
.NET Framework 4.5	Supported[1,2]
.NET Framework 4.0	Supported[1,2]
.NET Framework 3.5 SP1	Supported
.NET Framework 3.5	Supported[1]

[1] On Windows Server 2012, you need to install the .NET Framework 3.5 before you can use Exchange 2010 SP3.

[2] Exchange 2010 uses only the .NET Framework 3.5 and the .NET Framework 3.5 SP1 libraries. It doesn't use the .NET Framework 4.5 libraries if they're installed on the server. We support the installation of any version of the .NET Framework 4.5 (for example, .NET Framework 4.5.1, .NET Framework 4.5.2, etc.) as long as the .NET Framework 3.5 or the .NET Framework 3.5 SP1 is also installed on the server.

Windows PowerShell

- Exchange 2013 or later requires the version of Windows PowerShell that's included in Windows (unless otherwise specified by an Exchange Setup-enforced prerequisite rule).
- Exchange 2010 requires Windows PowerShell 2.0 on all supported versions of Windows.
- Exchange does not support the use of Windows Management Framework add-ons on any version of Windows PowerShell or Windows.
- If there are other installed versions of Windows PowerShell or PowerShell Core that support side-by-side operation, Exchange will use only the version that it requires.

Microsoft Management Console

The following table identifies the version of Microsoft Management Console (MMC) that can be used together with each version of Exchange.

MMC	EXCHANGE 2016	EXCHANGE 2013 SP1 AND LATER	EXCHANGE 2010 SP3
MMC 3.0	Supported	Supported	Supported

Windows Installer

The following table identifies the version of Windows Installer that is used together with each version of Exchange.

WINDOWS INSTALLER	EXCHANGE 2016	EXCHANGE 2013 SP1 AND LATER	EXCHANGE 2010 SP3
Windows Installer 4.5	Supported	Supported	Supported
Windows Installer 5.0	Supported	Supported	Not supported

Exchange Server virtualization

8/3/2020 • 10 minutes to read • Edit Online

You can deploy Exchange Server 2016 and Exchange Server 2019 in a virtualized environment. This topic provides an overview of the scenarios that are supported for deploying Exchange on hardware virtualization software.

The following terms are used in this discussion of Exchange virtualization:

- **Cold boot**: When bringing a system from a power-off state into a clean start of the operating system, the action is a *cold boot*. No operating system state has been persisted in this case.

- **Saved state**: When a virtual machine is powered off, hypervisors typically have the ability to save the state of the virtual machine, so when the machine is powered back on, it returns to that *saved state* rather than going through a cold boot startup.

- **Planned migration**: When a system administrator initiates the move of a virtual machine from one hypervisor host to another, the action is a *planned migration*. The action could be a single migration, or a system administrator could configure automation to move the virtual machine on a timed basis. A planned migration could also be the result of some other event that occurs in the system, other than hardware or software failure.

  The key point of a planned migration is the Exchange virtual machine is operating normally and needs to be relocated for some reason. This relocation can be done via technology (for example, Live Migration or vMotion). However, if the Exchange virtual machine or the hypervisor host where the virtual machine is located experiences some sort of failure condition, the outcome isn't characterized as a planned migration.

Requirements for hardware virtualization

Microsoft supports Exchange 2016 and Exchange 2019 in production on hardware virtualization software only when all the following conditions are true:

- The hardware virtualization software is running one of the following:

  - Any version of Windows Server with Hyper-V technology or Microsoft Hyper-V Server

  - Any third-party hypervisor that has been validated under the Windows Server Virtualization Validation Program.

  > **NOTE**
  > Deployment of Exchange 2016 or Exchange 2019 on Infrastructure-as-a-Service (IaaS) providers is supported if all supportability requirements are met. In the case of providers who are provisioning virtual machines, these requirements include ensuring that the hypervisor being used for Exchange virtual machines is fully supported, and that the infrastructure to be utilized by Exchange meets the performance requirements that were determined during the sizing process. Deployment on Microsoft Azure virtual machines is supported if all storage volumes used for Exchange databases and database transaction logs (including transport databases) are configured for Azure Premium Storage.

- The Exchange guest virtual machine has the following conditions:

  - It's running Exchange 2016 or Exchange 2019.

  - It's deployed on a supported version of Windows Server for Exchange.

For deployments of Exchange 2016 or Exchange 2019:

- All Exchange server roles are supported in a virtual machine.

- Exchange server virtual machines (including Exchange virtual machines that are part of a database availability group, or DAG), may be combined with host-based failover clustering and migration technology, as long as the virtual machines are configured such that they won't save and restore state on disk when moved or taken offline. All failover activity occurring at the hypervisor level must result in a cold boot when the virtual machine is activated on the target node. All planned migration must either result in shutdown and cold boot, or an online migration that makes use of a technology like Hyper-V Live Migration. Hypervisor migration of virtual machines is supported by the hypervisor vendor; therefore, you must ensure that your hypervisor vendor has tested and supports migration of Exchange virtual machines. Microsoft supports Hyper-V Live Migration of these virtual machines.

- Only management software (for example, antivirus software, backup software, or virtual machine management software) can be deployed on the physical host machine. No other server-based applications (for example, Exchange, SQL Server, Active Directory, or SAP) should be installed on the host machine. The host machine should be dedicated to running guest virtual machines.

- Some hypervisors include features for taking snapshots of virtual machines. Virtual machine snapshots capture the state of a virtual machine while it's running. This feature enables you to take multiple snapshots of a virtual machine and then revert the virtual machine to any of the previous states by applying a snapshot to the virtual machine. However, virtual machine snapshots aren't application aware, and using them can have unintended and unexpected consequences for a server application that maintains state data, such as Exchange. As a result, making virtual machine snapshots of an Exchange guest virtual machine isn't supported.

- Many hardware virtualization products allow you to specify the number of virtual processors that should be allocated to each guest virtual machine. The virtual processors located in the guest virtual machine share a fixed number of physical processor cores in the physical system. Exchange supports a virtual processor-to-physical processor core ratio no greater than 2:1, although we recommend a ratio of 1:1. For example, a dual processor system using quad core processors contains a total of 8 physical processor cores in the host system. On a system with this configuration, don't allocate more than a total of 16 virtual processors to all guest virtual machines combined.

- When calculating the total number of virtual processors required by the host machine, you must also account for both I/O and operating system requirements. In most cases, the equivalent number of virtual processors required in the host operating system for a system hosting Exchange virtual machines is 2. This value should be used as a baseline for the host operating system virtual processor when calculating the overall ratio of physical cores to virtual processors. If performance monitoring of the host operating system indicates you're consuming more processor utilization than the equivalent of 2 processors, you should reduce the count of virtual processors assigned to guest virtual machines accordingly and verify that the overall virtual processor-to-physical core ratio is no greater than 2:1.

- It's possible that guest virtual machines may be prevented from directly communicating with Fibre Channel or SCSI host bus adapters (HBAs) installed in the host machine. In this event, you must configure the adapters in the host machine's operating system and present the logical unit numbers (LUNs) to guest virtual machines as either a virtual disk or a pass-through disk.

- The only supported way to send emails to external domains from Azure compute resources is via an SMTP relay (also known as an SMTP smart host). The Azure compute resource sends the email to the SMTP relay and then the SMTP relay provider delivers the email to the external domain. Microsoft Exchange Online Protection is one provider of an SMTP relay, but there are a number of third-party providers as well. For more information, see Troubleshoot outbound SMTP connectivity issues in Azure.

Host machine storage requirements

The minimum disk space requirements for each host machine are described in the following list:

- Host machines in some hardware virtualization applications may require storage space for an operating system and its components. Additional storage space is also required to support the operating system's paging file, management software, and crash recovery (dump) files.
- Some hypervisors maintain files on the host machine that are unique to each guest virtual machine. For example, in a Hyper-V environment, a temporary memory storage file (BIN file) is created and maintained for each guest machine. The size of each BIN file is equal to the amount of memory allocated to the guest machine. In addition, other files may also be created and maintained on the host machine for each guest machine.
- If your host machine is running Windows Server 2012 Hyper-V or Hyper-V 2012, and you're configuring a host-based failover cluster that will host Exchange Mailbox servers in a DAG, we recommend following the guidance in KB2872325.

Exchange storage requirements

Requirements for storage connected to a virtualized Exchange server are as follows:

- Each Exchange guest machine must be allocated sufficient storage space on the host machine for the fixed disk that contains the guest's operating system, any temporary memory storage files in use, and related virtual machine files that are hosted on the host machine. In addition, for each Exchange guest machine, you must also allocate sufficient storage for the message queues and sufficient storage for the databases and log files on Mailbox servers.
- The storage used by the Exchange guest machine for storage of Exchange data (for example, mailbox databases and transport queues) can be virtual storage of a fixed size (for example, fixed virtual hard disks (VHD or VHDX) in a Hyper-V environment), dynamic virtual storage when using VHDX files with Hyper-V, SCSI pass-through storage, or Internet SCSI (iSCSI) storage. Pass-through storage is storage that's configured at the host level and dedicated to one guest machine. All storage used by an Exchange guest machine for storage of Exchange data must be block-level storage because Exchange doesn't support the use of network attached storage (NAS) volumes, other than in the SMB 3.0 scenario outlined later in this topic. Also, NAS storage that's presented to the guest as block-level storage via the hypervisor isn't supported.
- Fixed VHDs may be stored on SMB 3.0 files that are backed by block-level storage if the guest machine is running on Windows Server 2012 Hyper-V (or a later version of Hyper-V). The only supported usage of SMB 3.0 file shares is for storage of fixed VHDs. Such file shares can't be used for direct storage of Exchange data. When using SMB 3.0 file shares to store fixed VHDs, the storage backing the file share should be configured for high availability to ensure the best possible availability of the Exchange service.
- Storage used by Exchange should be hosted in disk spindles that are separate from the storage that's hosting the guest virtual machine's operating system.
- Configuring iSCSI storage to use an iSCSI initiator inside an Exchange guest virtual machine is supported. However, there is reduced performance in this configuration if the network stack inside a virtual machine isn't full-featured (for example, not all virtual network stacks support jumbo frames).

Exchange memory requirements and recommendations

Some hypervisors have the ability to oversubscribe/overcommit or dynamically adjust the amount of memory available to a specific guest machine based on the perceived usage of memory in the guest machine as compared to the needs of other guest machines managed by the same hypervisor. This technology makes sense for workloads in which memory is needed for brief periods of time and then can be surrendered for other uses. However, it doesn't make sense for workloads that are designed to use memory on an ongoing basis. Exchange (like many server applications with optimizations for performance that involve caching of data in memory) is susceptible to poor system performance and an unacceptable client experience if it doesn't have full control over the memory allocated to the physical or virtual machine on which it's running. As a result, using dynamic memory or memory overcommit features for Exchange isn't supported.

Host-based failover clustering and migration for Exchange

The following are answers to some frequently asked questions about host-based failover clustering and migration technology with Exchange DAGs:

- **Does Microsoft support third-party migration technology?**

  Microsoft can't make support statements for the integration of third-party hypervisor products using these technologies with Exchange, because these technologies aren't part of the Server Virtualization Validation Program (SVVP). The SVVP covers the other aspects of Microsoft support for third-party hypervisors. You need to ensure that your hypervisor vendor supports the combination of their migration and clustering technology with Exchange. If your hypervisor vendor supports their migration technology with Exchange, Microsoft supports Exchange with their migration technology.

- **How does Microsoft define host-based failover clustering?**

  Host-based failover clustering refers to any technology that provides the automatic ability to react to host-level failures and start affected virtual machines on alternate servers. Use of this technology is supported given that, in a failure scenario, the virtual machine is coming up from a cold boot on the alternate host. This technology helps to make sure that the virtual machine never comes up from a saved state that's persisted on disk because it will be stale relative to the rest of the DAG members.

- **What does Microsoft mean by migration support?**

  Migration technology refers to any technology that allows a planned move of a virtual machine from one host machine to another host machine. This move could also be an automated move that occurs as part of resource load balancing, but it isn't related to a failure in the system. Migrations are supported as long as the virtual machines never come up from a saved state that's persisted on disk. This means that technology that moves a virtual machine by transporting the state and virtual machine memory over the network with no perceived downtime is supported for use with Exchange. A third-party hypervisor vendor must provide support for the migration technology, while Microsoft provides support for Exchange when used in this configuration.

Plan Exchange 2016 integration with SharePoint and Skype for Business

8/3/2020 • 10 minutes to read • Edit Online

Exchange 2016 integration with SharePoint Server 2016 and Skype for Business allow for services that provide the ability to preserve, archive, and then quickly search email, documents, and other content. Together, these enterprise applications make possible scenarios such as eDiscovery and collaboration using site mailboxes to let your organization preserve important data. Critical in most organizations these days is the ability to archive and then locate email and documents as required to meet compliance and regulatory requirements. You can use Exchange 2016 along with SharePoint 2016 and Skype for Business to:

- Archive Exchange mailboxes
- Archive Skype for Business content
- Preserve SharePoint Server 2016 documents and websites
- Search across stores using eDiscovery
- Authenticate seamlessly across servers

The eDiscovery Center introduced in SharePoint 2013 provides content identification, preservation, collection, processing, and analysis. In an Exchange environment, eDiscovery lets you archive content discovered across SharePoint Server 2016, Skype for Business, andExchange. You can use the eDiscovery Center to create eDiscovery Case sites that are used to organize in-place holds, queries, and exports for a specific case.

Exchange 2016, SharePoint Server 2016, and Skype for Business Server use the standard protocol, Open Authorization (OAuth), for server-to-server authentication to provide the cross-product functionality described here. Using the same protocol allows these applications to seamlessly and securely authenticate to each other. The authorization method supports authentication as an application by means of a linked account and user impersonation where the access request is made in the user context. You can learn more about OAuth later in this article in the Server-to-server authentication using OAuth section.

> **NOTE**
>
> For enterprises that use Lync Server 2013, you can still make full use of the features described in this topic.

Archive Skype for Business content in Exchange 2016

With Exchange 2016 and Lync Server 2013 deployed in an organization, you can configure Skype for Business to archive instant message and on-line meeting content, including shared presentations or documents in the user's Exchange 2016 mailbox. Archiving Skype for Business data in Exchange 2016 allows you to apply retention policies to the data. Archived Skype for Business content also surfaces in any eDiscovery searches. For more details about Skype for Business archiving and how to deploy it, see the following topics:

- Planning for Archiving
- Deploying Archiving

Preserve documents in SharePoint Server 2016

You can create a query-based hold to preserve items that meet your specified criteria with an In-Place Hold.

For example, Litigation Hold preserves until the hold is removed any deleted items as well as original versions of modified items . You can optionally specify a hold duration that preserves a mailbox item for the named duration period. If you specify a hold duration period, it's calculated from the date a message is received or a mailbox item is created. For details, see Create or remove an In-Place Hold.

For more details on eDiscovery see the following topics:

- In-Place eDiscovery in Exchange Server
- In-Place Hold and Litigation Hold in Exchange Server
- Configure eDiscovery in SharePoint Server
- What's new in eDiscovery in SharePoint Server
- Configure Exchange for SharePoint eDiscovery Center

Search across applications by using eDiscovery

SharePoint Server 2016 provides the eDiscovery Center to help you locate and then transfer relevant content as needed to meet regulatory requirements. eDiscovery is the process of finding, preserving, analyzing, and producing content in digital format required by litigation or investigations. You can use eDiscovery across Exchange 2016, SharePoint Server 2016, and Skype for Business files. You can help protect content in-place that you've identified with eDiscovery queries and then export the results into an offline format to hand off for legal review. In-Place Hold in eDiscovery lets you:

- Protect content in-place and in real time at reduced storage costs, without affecting your users' daily work.
- Query to collect up-to-date, relevant content and statistics quickly answer questions.
- Export relevant content in an offline and portable format.

If your organization adheres to legal discovery requirements, that is, anything related to organizational policy, compliance, or lawsuits, In-Place eDiscovery in Exchange Server 2016 can help you perform discovery searches for relevant content within mailboxes. You can also use In-Place eDiscovery in an Exchange hybrid environment to search on-premises and cloud-based mailboxes in the same search.

When you configure server-to-server authentication betweenExchange 2016 and SharePoint Server 2016 in on-premises deployments, administrators and compliance officers can use the eDiscovery Center. For more information, see Configure Exchange for SharePoint eDiscovery Center. In hybrid deployments, for more information see Using Oauth Authentication to Support eDiscovery in an Exchange Hybrid Deployment

You can identify and reduce your data set by using keyword syntax, property restrictions, and refinements. The query experience focuses on statistics for individual sources and query fragments to help you make decisions about the content you're searching across. You can also preview SharePoint 2016 and Exchange 2016 content to confirm that you have identified the right set of results.

Server-to-server authentication using OAuth

The OAuth protocol is used by many web sites and web services to let clients access resources without having to provide a username and password. An authorization server trusted by the resource owner provides the client with an access token that grants access to a specific set of resources for a specified period. Exchange 2016 allows other applications to use OAuth to authenticate to Exchange. You'll need to configure the applications in Exchange as partner applications.

There are two configuration objects used for OAuth andExchange 2016 partner applications: AuthConfig and the partner application configuration.

- **AuthConfig**: Exchange 2016 Setup creates AuthConfig to publish the auth metadata. You only need to manage AuthConfig to provision a new certificate when the existing certificate is close to expiration. When this happens, you can renew the existing certificate and configure the new certificate as the next certificate in the AuthConfig along with its effective date.

  Exchange 2016 Setup creates a self-signed certificate with the friendly name Microsoft Exchange Server Auth Certificate and replicates the certificate to all front-end servers in the Exchange organization. The certificate's thumbprint is specified in the authorization configuration for Exchange 2016, along with its service name, which is a well-known GUID that represents on-premises Exchange 2016. Exchange uses the authorization configuration to publish its auth metadata document.

- **Partner applications**: You enable partner applications by creating a partner application configuration to request access tokens from Exchange. Exchange 2016 provides the `Configure-EnterprisePartnerApplication.ps1` script that lets you quickly and easily create partner application configurations and minimize configuration errors.

  When Exchange 2016 receives an access request from a partner application via Exchange Web Services (EWS), the following events take place.

  - EWS parses the `www-authenticate` header of the https request that contains the access token signed by the calling server using its private key.

  - The auth module validates the access token using the partner application configuration.

  - The module then grants access to resources based on the RBAC permissions granted to the application. If the access token is on behalf of a user, the RBAC permissions granted to the user are checked.

    For example, if a user performs an eDiscovery search using the eDiscovery Center in SharePoint 2016, Exchange checks whether the user is a member of the Discovery Management role group or has the Mailbox Search role assigned and the mailboxes being searched are within the scope of the RBAC role assignment. For more details, see Permissions.

In on-premises deployments, Exchange 2016, SharePoint Server 2016, and Skype for Business Server 2015 do not require an authorization server to issue tokens. Each application issues self-signed tokens to access the resources provided by other applications. The application that provides access to resources, for example Exchange 2016, trusts the self-signed tokens presented by the calling application. Trust is established by creating a *partner application* configuration for the calling application, which includes the calling application's ApplicationID, certificate, and AuthMetadataUrl. Exchange 2016, SharePoint 2016, and Skype for Business publish their auth metadata document in a well-known URL.

Auth metadata URLs

SERVER	AUTHMETADATAURL
Exchange 2016	`https://<serverfqdn>/autodiscover/metadata/json/1`
SharePoint Server 2016	`https://<serverfqdn>/_layouts/15/metadata/json/1`
Skype for Business	`https://<serverfqdn>/metadata/json/1`

In hybrid deployments, you need to configure OAuth authorization protocol between your on-premises Exchange 2016 and Exchange Online organizations. Hybrid deployments by default continue to use the federation trust process.

Certain Exchange 2016 features are only fully available across your organization by using the new OAuth protocol. For example, before you can use In-Place eDiscovery to search on-premises and cloud-based mailboxes in an Exchange hybrid organization, you need to configure OAuth authentication between your Exchange on-premises and Exchange Online organizations. The Hybrid Configuration Wizard doesn't manage the OAuth authorization connection. For more information, see Configure OAuth Authentication Between Exchange and Exchange Online Organizations.

In online deployments, Exchange Online, SharePoint Online and Skype for Business Online need to be configured for a modern authentication connection. Modern authentication brings Active Directory Authentication Library (ADAL)-based sign in to Office 2013 Windows clients. Office 2013 client applications sign in to the Microsoft 365 or Office 365 service to gain access to Exchange Online, SharePoint Online, and Skype for Business Online. We recommend that you enable Exchange Online for modern authentication when enabling modern authentication for Skype for Business. Modern authentication is enabled by default in SharePoint Online. For more information, see Enable or disable modern authentication for Outlook in Exchange Online.

The per service default state of modern authentication is:

- Skype for Business Online - OFF by default
- Skype for Business Online - OFF by default
- SharePoint Online - ON by default.

IMPORTANT

The default Server Auth Certificate created by Exchange 2016 is valid for five years. You need to make sure that the authorization configuration includes a current certificate.

Manage SharePoint site mailboxes

In many organizations, information resides in two different stores: email in Exchange and documents in SharePoint. There are two different interfaces to access these stores. This makes for a disjointed user experience that impedes effective collaboration. Site mailboxes in SharePoint let users collaborate effectively by bringing together Exchange emails and SharePoint documents. For users, a site mailbox serves as a central filing cabinet, providing a place to file project emails and documents that can only be accessed and edited by site members. Site mailboxes are visible in Outlook 2016 to give users easy access to the email and documents for the projects they care about. Additionally, the same set of content can be accessed directly from the SharePoint site itself.

In a site mailbox, content is kept where it belongs. Exchange stores the email, providing users with the same message view for email conversations that they use every day for their own mailboxes. SharePoint stores the documents, which allows for document coauthoring and versioning. Exchange synchronizes just enough metadata from SharePoint to create the document view in Outlook (that is, document title, last modified date, last modified author, and size).

You can provision and manage site mailboxes from SharePoint Server 2016. For more information, including how to configure site mailboxes, see the following topics.

- Site Mailboxes
- Configure email integration for a SharePoint Server farm

Manage access to unified contact store

The unified contact store (UCS) feature provides a consistent contact experience across Office products. This feature lets users store all contact information in their Exchange 2016 mailbox so that the same contact information is available globally across Skype for Business, SharePoint, Exchange, Outlook and Outlook on the web. When you deploy aSkype for Business Server and publish the topology, UCS is enabled for all users by default and no additional action is needed. For more information, see Configure Skype for Business Server to use the unified contact store.

A user's contacts are automatically migrated to the Exchange 2016 server when the user:

- Is assigned a user services policy that has UcsAllowed set to True.

- Was provisioned with an Exchange 2016 mailbox and has signed into the mailbox at least once.

- Logs in by using a Skype for Business rich client.

After you have installed SharePoint Server 2016 in an environment with Exchange 2016 and you have configured server-to-server authentication between the two, users can initiate the migration of existing contacts from SharePoint 2016 or Skype for Business Server 2015 to Exchange 2016. For details, see Planning and Deploying Unified Contact Store.

Manage access to high-resolution user photos

The user photos feature lets you store high resolution user photos in Exchange 2016 that can be accessed by client applications, including Outlook, Outlook on the web, SharePoint 2016, Skype for Business, and mobile email clients. A low-resolution photo is also stored in Active Directory. The cmdlet *Set-UserPhoto* stores a copy of a high resolution image in the user's Exchange mailbox, and stores a 64×64 pixel copy of the photo as an image in the Active Directory attribute thumbnailPhoto.

As with UCS, user photos allow your organization to maintain a consistent user profile photo that can be consumed by client applications without requiring each application to have its own user photos and different ways to add and manage them. Users can manage their own photos by using Outlook on the web, SharePoint 2016 or Skype for Business. For detail about managing photos on Outlook on the web, see Change your photo and account information in Outlook on the web.

Configure OAuth authentication with SharePoint 2013 and Lync 2013

8/3/2020 • 2 minutes to read • Edit Online

Exchange 2016 supports partner applications such as SharePoint Server 2016 and Skype for Business Server 2015 by using OAuth configuration with the script, `Configure-EnterpriseApplication.ps1`. You can automate the task using the script to more easily configure authentication with partner applications and reduce configuration errors. The script performs the following tasks:

1. Configures an Enterprise partner application that self-issues OAuth tokens to successfully authenticate to Exchange.

2. Assigns Role Based Access Control (RBAC) roles to the partner application to authorize it for calling specific Exchange Web Services APIs.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.

- The partner application needs to publish an authentication metadata document for Exchange 2016 to establish a direct trust to this application and accept authentication requests.

- Examples in this topic use the following default location of the `\Scripts` directory: `C:\Program Files\Microsoft\Exchange Server\V15\Scripts`.

- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Partner applications - configure" entry in the Sharing and collaboration permissions topic.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Configure OAuth authentication with a partner application

This procedure uses the `Configure-EnterpriseApplication.ps1` script to configure OAuth authentication with partner applications. Access to resources depends on the permissions assigned to the partner application and/or the user it impersonates by using RBAC. After configuring OAuth authentication from Exchange, the partner application can use Exchange 2016 resources.

1. This example configures OAuth authentication for SharePoint 2016.

```
Cd C:\Program Files\Microsoft\Exchange Server\V15\Scripts
Configure-EnterprisePartnerApplication.ps1 -AuthMetaDataUrl
https://sharepoint.contoso.com/_layouts/15/metadata/json/1 -ApplicationType SharePoint
```

2. This example configures OAuth authentication for Skype for Business or Lync Server 2013.

   ```
   Cd C:\Program Files\Microsoft\Exchange Server\V15\Scripts
   Configure-EnterprisePartnerApplication.ps1 -AuthMetaDataUrl https://lync.contoso.com/metadata/json/1 -
   ApplicationType Lync
   ```

If Exchange 2016 also needs to access resources offered by the partner application, you must also configure OAuth authentication in the partner application.

How do you know this worked?

To verify that you have successfully configured an enterprise partner application to authenticate to Exchange 2016 , run the Get-PartnerApplication cmdlet in the Exchange Management Shell to retrieve the configuration. You can also run the Test-OAuthConnectivity cmdlet to test OAuth connectivity with a partner application for a user.

Hybrid and on-premises deployments

- In hybrid deployments, you can use OAuth authentication between your on-premises Exchange 2016 organization and the Exchange Online organization. For more information, see Using Oauth Authentication to Support eDiscovery in an Exchange Hybrid Deployment.

- In on-premises deployments, you can configure server-to-server authentication between Exchange 2016 and SharePoint 2016 so administrators and compliance officers can search Exchange 2016 by using the SharePoint 2016 eDiscovery Center.. For more information, see Configure Exchange for SharePoint eDiscovery Center.

Exchange Server post-installation tasks

8/3/2020 • 2 minutes to read • Edit Online

Read the following topics to help you configure your new Exchange 2016 or Exchange 2016 organization.

TOPIC	DESCRIPTION
Enter your Exchange product key	Learn how to license your Exchange server.
Configure mail flow and client access on Exchange servers	Learn how to configure mail flow to and from the Internet and configure Exchange to accept client connections from the Internet.
Verify Exchange Server installations	Learn how to verify that Exchange 2016 was installed successfully in your organization.
Install the Exchange management tools	Learn how to install the Exchange Management Shell and Exchange Toolbox on client workstations or other non-Exchange servers in your organization.
Configure instant messaging integration with Outlook on the web in Exchange	Learn how to configure instant messaging (IM) integration between Skype for Business Server and Outlook on the web (formerly known as Outlook Web App)
Change the offline address book generation schedule in Exchange	Learn how to change the offline address book (OAB) generation schedule on specific Exchange servers or for the whole organization
Configure certificate based authentication in Exchange 2016	Learn how to configure CBA in Exchange 2016 CU1 or later
Edge Subscriptions	Learn how to configure an EdgeSync Subscription between a new Edge Transport server in the perimeter network and the Exchange Mailbox servers in an internal Active Directory site.

Note:

If you've enabled the Scripting Agent in your Exchange organization, and you keep a customized %ExchangeInstallPath%Bin\CmdletExtensionAgents\ScriptingAgentConfig.xml file on all of your Mailbox servers, you need to copy that file to every new Mailbox server that you deploy in your organization (the file isn't used on Edge Transport servers).

- The default value of %ExchangeInstallationPath% is %ProgramFiles%\Microsoft\Exchange Server\V15, but the actual value is wherever you installed Exchange on the server.
- The default name of the file on a new Exchange server is %ExchangeInstallPath%Bin\CmdletExtensionAgents\ScriptingAgentConfig.xml.sample. As part of enabling the Scripting Agent in your organization, you need to rename this file to ScriptingAgentConfig.xml and customize it or replace it with your existing ScriptingAgentConfig.xml file.

For more information about the Scripting Agent in Exchange 2013 (which still applies to Exchange 2016 and 2019), see Scripting Agent.

Enter your Exchange Server product key

8/3/2020 • 4 minutes to read • Edit Online

A product key tells Exchange Server 2016 or Exchange Server 2019 that you've purchased a Standard or Enterprise Edition license. If the product key you purchased is for an Enterprise Edition license, it lets you mount more than five databases per server in addition to everything that's available with a Standard Edition license. If you want to read more about Exchange licensing, see Exchange Server editions and versions.

If you don't enter a product key, your server is automatically licensed as a trial edition. The trial edition functions just like an Exchange Standard Edition server and is helpful if you want to try out Exchange before you buy it, or to run tests in a lab. The only difference is that you can only use an Exchange server licensed as a trial edition for up to 180 days. If you want to keep using the server beyond 180 days, you'll need to enter a product key or the Exchange admin center (EAC) will start to show reminders that you need to enter a product key to license the server.

Note: If you want to install or activate Office, check out:

- Install Office
- Need help with your Office product key?

If you want to enter a product key on an older version of Exchange, check out Enter an Exchange 2010 product key.

If you want to enter a product key on an Exchange 2016 or Exchange 2019 server, you're in the right place! Read on.

What do you need to know before you begin?

- Estimated time to complete this procedure: less than 5 minutes.
- To open the EAC, see Exchange admin center in Exchange Server. To open the Exchange Management Shell, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Product key" entry in the Exchange infrastructure and PowerShell permissions topic.
- After you license an Exchange Mailbox server, you need to restart the Microsoft Exchange Information Store service on the server after you enter the product key.
- You can upgrade from a Standard Edition license to an Enterprise Edition license. You can't downgrade from an Enterprise Edition license to a Standard Edition license without reinstalling Exchange.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

TIP

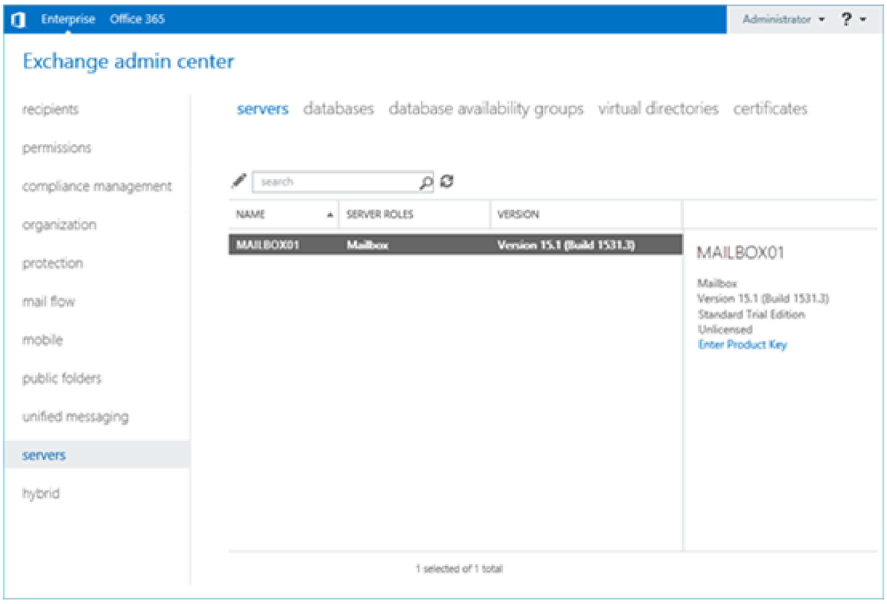
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the EAC to enter the product key

1. In the EAC. go to **Servers** > **Servers**, select the server you want to license, and then do either of the following steps:

   - Click **Edit** ✎.

   - In the details pane, click **Enter Product Key**. Note that this link is only available for unlicensed servers.



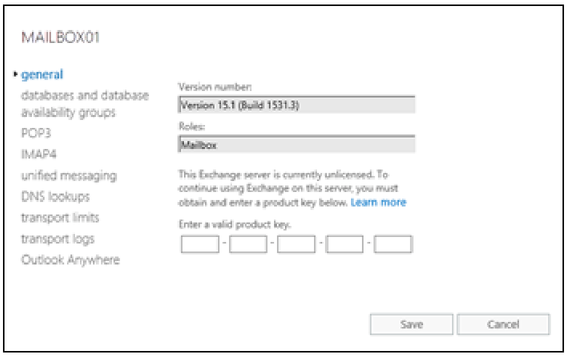
NAME	SERVER ROLES	VERSION
MAILBOX01	Mailbox	Version 15.1 (Build 1531.3)

MAILBOX01

Mailbox
Version 15.1 (Build 1531.3)
Standard Trial Edition
Unlicensed
Enter Product Key

2. The Exchange server properties window opens. On the **General** tab, do one of the following steps:

   - **License an unlicensed server**: Enter the product key in the **Enter a valid product key** text boxes.

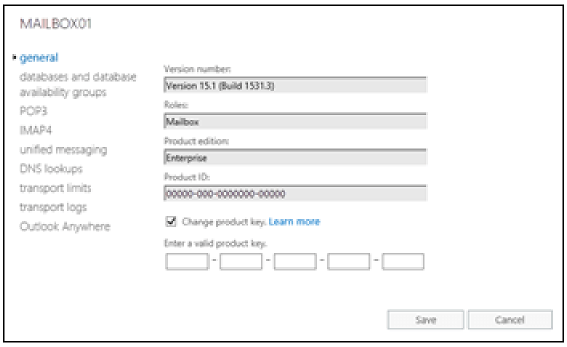


Version number:
Version 15.1 (Build 1531.3)
Roles:
Mailbox

This Exchange server is currently unlicensed. To continue using Exchange on this server, you must obtain and enter a product key below. Learn more

Enter a valid product key.
□ - □ - □ - □ - □

   - **Change or upgrade the product key on a licensed server**: Select **Change product key** and enter the product key in the **Enter a valid product key** text boxes. Note that you'll only see **Change product key** if the server is already licensed.



Version number:
Version 15.1 (Build 1531.3)
Roles:
Mailbox
Product edition:
Enterprise
Product ID:
00000-000-0000000-00000

☑ Change product key. Learn more

Enter a valid product key.
□ - □ - □ - □ - □

   When you're finished, click **Save**.

After you license a Mailbox server, do the following steps to restart the Microsoft Exchange Information Store service:

1. On the Exchange server, open the Windows Services console. For example:
   - Run the command `services.msc` from the **Run** dialog, a Command Prompt window, or the Exchange Management Shell.
   - Open Server Manager, and then click **Tools** > **Services**.
2. In the list of services, right-click on **Microsoft Exchange Information Store**, and then click **Restart**.

Use the Exchange Management Shell to enter the product key

To enter the product key in the Exchange Management Shell, use this syntax:

```
Set-ExchangeServer <ServerName> -ProductKey <ProductKey>
```

Note that this command works to license an unlicensed server or to upgrade a licensed server from a Standard Edition license to an Enterprise Edition license.

This example licenses the Exchange server named Mailbox01.

```
Set-ExchangeServer Mailbox01 -ProductKey 12345-12345-12345-12345-12345
```

For detailed syntax and parameter information, see Set-ExchangeServer.

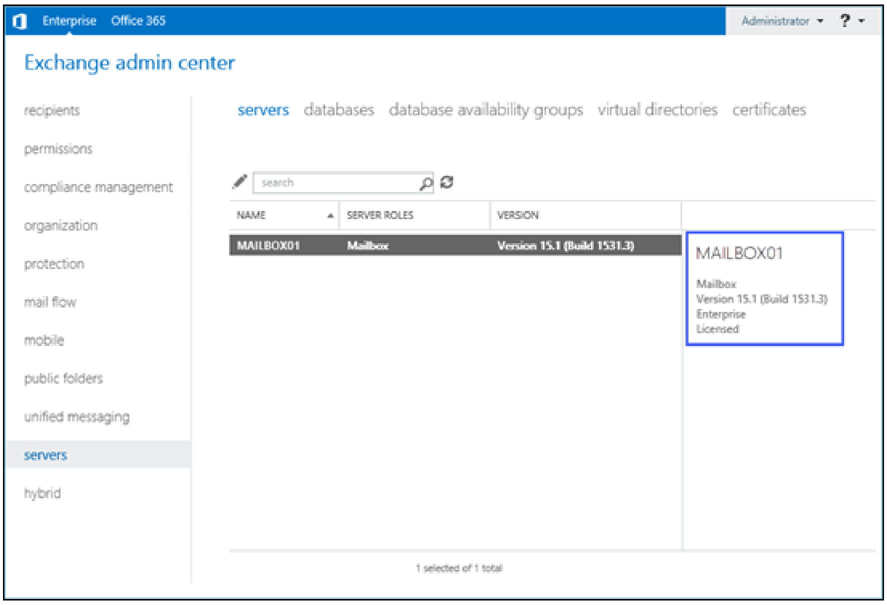
After you license a Mailbox server, run the following command in the Exchange Management Shell to restart the Microsoft Exchange Information Store service:

```
Restart-Service MSExchangeIS
```

How do you know this worked?

To verify that you've successfully licensed the Exchange server, do any of the following steps:

- In the EAC, go to **Servers** > **Servers**, and select the server you licensed. In the details pane, verify the Exchange edition value (**Standard** or **Enterprise**) and whether the value **Licensed** is present.



NAME	SERVER ROLES	VERSION
MAILBOX01	Mailbox	Version 15.1 (Build 1531.3)

MAILBOX01
Mailbox
Version 15.1 (Build 1531.3)
Enterprise
Licensed

1 selected of 1 total

- In the Exchange Management Shell, replace *<ServerName>* with the name of the Exchange server you licensed, and run the following command to verify the property values:

```
Get-ExchangeServer <ServerName> | Format-List Name,Edition,*Trial*
```

- In the Exchange Management Shell, run the following command to view the licensing status of all Exchange servers in your organization:

```
Get-ExchangeServer | Format-Table -Auto Name,Edition,*Trial*
```

Configure mail flow and client access on Exchange servers

8/3/2020 • 13 minutes to read • Edit Online

After you've installed Exchange Server 2016 or Exchange 2019 in your organization, you need to configure Exchange for mail flow and client access. Without these additional steps, you won't be able to send mail to the internet and external clients (for example, Microsoft Outlook, and Exchange ActiveSync devices) won't be able to connect to your Exchange organization.

The steps in this topic assume a basic Exchange deployment with a single Active Directory site and a single simple mail transport protocol (SMTP) namespace.

IMPORTANT

This topic uses example values such as Mailbox01, contoso.com, mail.contoso.com, and 172.16.10.11. Replace the example values with the server names, FQDNs, and IP addresses for your organization.

For additional management tasks related to mail flow and clients and devices, see Mail flow and the transport pipeline and Clients and mobile.

What do you need to know before you begin?

- Estimated time to complete this task: 50 minutes
- You might receive certificate warnings when you connect to the Exchange admin center (EAC) website until you configure a secure sockets layer (SSL) certificate on the Mailbox server. You'll be shown how to do this later in this topic.
- To open the EAC, see Exchange admin center in Exchange Server. To open the Exchange Management Shell, see Open the Exchange Management Shell.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

TIP

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Step 1: Create an internet Send connector

Before you can send mail to the internet, you need to create a Send connector on the Mailbox server. For instructions, see Create a Send connector in Exchange Server to send mail to the internet.

NOTE

By default, a Receive connector named "Default Frontend <ServerName>_" is created when Exchange is installed. This Receive connector accepts anonymous SMTP connections from external servers. You don't need to do any additional configuration if this is the functionality you want. If you want to restrict inbound connections from external servers, modify the **Default Frontend <Mailbox server>** Receive connector on the Mailbox server. For more information, see Default Receive connectors created during setup.

Step 2: Add additional accepted domains

By default, Exchange uses the Active Directory domain where Setup /PrepareAD was run for email addresses. If you want recipients to receive and send messages to and from another domain, you need to add the domain as an accepted domain. For instructions, see Create accepted domains and Configure Exchange to accept mail for multiple authoritative domains.

IMPORTANT

To receive email from the internet for a domain, you need an MX resource record in your public DNS for that domain. Each MX record should resolve to the internet-facing server that receives email for your organization.

Step 3: Configure the default email address policy

You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Email address policies" entry in the Email address and address book permissions topic.

If you added an accepted domain in the previous step and you want that domain to be added to every recipient in the organization, you need to update the default email address policy. For instructions, see Modify email address policies and Apply email address policies to recipients.

NOTE

We recommend that you configure a user principal name (UPN) that matches the primary email address of each user. If you don't provide a UPN that matches the email address of a user, the user will be required to manually provide their domain\username or UPN in addition to their email address. If their UPN matches their email address, Outlook on the web (formerly known as Outlook on the web), ActiveSync, and Outlook will automatically match their email address to their UPN.

Step 4: Configure external URLs

You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the " *<Service>* virtual directory settings" entry in the Clients and mobile devices permissions topic.

Before clients can connect to your new server from the internet, you need to configure the external domains (or URLs) on the virtual directories in the Client Access (frontend) services on the Mailbox server and then in your public DNS records. The steps below configure the same external domain on the external URL of each virtual directory. If you want to configure different external domains on one or more virtual directory external URLs, you need to configure the external URLs manually. For more information, see Default settings for Exchange virtual directories.

1. Open the EAC and go to **Servers** > **Servers**, select your internet-facing Mailbox server that your clients will connect to, and then click **Edit** ✎.

2. In the Exchange server properties window that opens, select the **Outlook Anywhere** tab, configure the following settings:

   Specify the external host name...: Enter the externally accessible FQDN that your external clients will use to connect to their mailboxes (for example, mail.contoso.com).

   Specify the internal host name...: Enter the internally accessible FQDN (for example, mail.contoso.com).

   When you're finished, click **Save**.

3. Go to **Servers** > **Virtual directories** and then select **Configure external access domain** 🔧.

4. In the **Configure external access domain** window opens, configure the following settings:

   a. **Select the Mailbox servers to use with the external URL**: Click **Add** +

   b. In the **Select a server** dialog that opens, select the Mailbox server you want to configure and then click **Add**. After you've added all of the Mailbox servers that you want to configure, click **OK**.

   c. **Enter the domain name you will use with your external Mailbox servers**: Enter the external domain that you want to apply (for example, mail.contoso.com). When you're finished, click **Save**.

Some organizations use a unique Outlook on the web FQDN to protect against future changes to the underlying server FQDN. Many organizations use owa.contoso.com for their Outlook on the web FQDN instead of mail.contoso.com. If you want to configure a unique Outlook on the web FQDN, do the following steps. This checklist assumes you have configured a unique Outlook on the web FQDN.

1. Back at **Servers** > **Virtual directories**, select **owa (Default Web Site)** on the server that you want to configure, and then click **Edit** ✏.

2. The **owa (Default web site)** window opens. On the **General** tab in the **External URL** field, enter the following information:

   - https://
   - The unique Outlook on the web FQDN you want to use (for example, owa.contoso.com), and then append /owa. For example, https://owa.contoso.com/owa.
   - /owa

   In this example, the final value would be https://owa.contoso.com/owa.

   When you're finished, click **Save**.

3. Back at **Servers** > **Virtual directories**, select **ecp (Default Web Site)** on the server that you want to configure, and click **Edit** ✏.

4. In the **ecp (Default web site)** window that opens, enter the same URL from the previous step, but append the value /ecp instead of /owa (for example, https://owa.contoso.com/ecp). When you're finished, click **Save**.

After you've configured the external URL in the Client Access services virtual directories on the Mailbox server, you need to configure your public DNS records for Autodiscover, Outlook on the web, and mail flow. The public DNS records should point to the external IP address or FQDN of your internet-facing Mailbox server and use the externally accessible FQDNs that you've configured on your Mailbox server. The recommended DNS records that you should create to enable mail flow and external client connectivity are described in the following table:

FQDN	DNS RECORD TYPE	VALUE
Contoso.com	MX	Mail.contoso.com

FQDN	DNS RECORD TYPE	VALUE
Mail.contoso.com	A	172.16.10.11
Owa.contoso.com	CNAME	Mail.contoso.com
Autodiscover.contoso.com	CNAME	Mail.contoso.com

How do you know this step worked?

To verify that you've successfully configured the external URLs in the Client Access services virtual directories on the Mailbox server, do the following steps:

1. In the EAC, go to **Servers** > **Virtual directories**.
2. In the **Select server** field, select the internet-facing Mailbox server.
3. Select a virtual directory and then, in the virtual directory details pane, verify that the **External URL** field is populated with the correct FQDN and service as shown in the following table:

VIRTUAL DIRECTORY	EXTERNAL URL VALUE
Autodiscover	No external URL displayed
ECP	https://owa.contoso.com/ecp
EWS	https://mail.contoso.com/EWS/Exchange.asmx
Microsoft-Server-ActiveSync	https://mail.contoso.com/Microsoft-Server-ActiveSync
OAB	https://mail.contoso.com/OAB
OWA	https://owa.contoso.com/owa
PowerShell	http://mail.contoso.com/PowerShell

To verify that you've successfully configured your public DNS records, do the following steps:

1. Open a command prompt and run `nslookup.exe`.
2. Change to a DNS server that can query your public DNS zone.
3. In `nslookup`, look up the record of each FQDN you created. Verify that the value that's returned for each FQDN is correct.
4. In `nslookup`, type `set type=mx` and then look up the accepted domain you added in Step 1. Verify that the value returned matches the FQDN of the Mailbox server.

Step 5: Configure internal URLs

You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the " *<Service>* virtual directory settings" entry in the Clients and mobile devices permissions topic.

Before clients can connect to your new server from your internal network, you need to configure the internal domains (or URLs) on the virtual directories in the Client Access (frontend) services on the Mailbox server and then in your internal DNS records.

The procedure below lets you choose whether you want users to use the same URL on your intranet and on the internet to access your Exchange server or whether they should use a different URL. What you choose depends on the addressing scheme you have in place already or that you want to implement. If you're implementing a new addressing scheme, we recommend that you use the same URL for both internal and external URLs. Using the same URL makes it easier for users to access your Exchange server because they only have to remember one address.

Regardless of your decision, you need to configure a private DNS zone for the address space you choose. For more information about administering DNS zones, see Administering DNS Server.

For more information about internal and external URLs on virtual directories, see Default settings for Exchange virtual directories Virtual Directory Management.

Configure internal and external URLs to be the same

1. Open the Exchange Management Shell on your Mailbox server.

2. Store the host name of your Mailbox server in a variable that will be used in the next step. For example, Mailbox01.

   ```
   $HostName = "Mailbox01"
   ```

3. Run each of the following commands in the Exchange Management Shell to configure each internal URL to match the virtual directory's external URL.

   ```
   Set-EcpVirtualDirectory "$HostName\ECP (Default Web Site)" -InternalUrl ((Get-EcpVirtualDirectory
   "$HostName\ECP (Default Web Site)").ExternalUrl)
   ```

   ```
   Set-WebServicesVirtualDirectory "$HostName\EWS (Default Web Site)" -InternalUrl ((Get-
   WebServicesVirtualDirectory "$HostName\EWS (Default Web Site)").ExternalUrl)
   ```

   ```
   Set-ActiveSyncVirtualDirectory "$HostName\Microsoft-Server-ActiveSync (Default Web Site)" -InternalUrl
   ((Get-ActiveSyncVirtualDirectory "$HostName\Microsoft-Server-ActiveSync (Default Web
   Site)").ExternalUrl)
   ```

   ```
   Set-OabVirtualDirectory "$HostName\OAB (Default Web Site)" -InternalUrl ((Get-OabVirtualDirectory
   "$HostName\OAB (Default Web Site)").ExternalUrl)
   ```

   ```
   Set-OwaVirtualDirectory "$HostName\OWA (Default Web Site)" -InternalUrl ((Get-OwaVirtualDirectory
   "$HostName\OWA (Default Web Site)").ExternalUrl)
   ```

   ```
   Set-PowerShellVirtualDirectory "$HostName\PowerShell (Default Web Site)" -InternalUrl ((Get-
   PowerShellVirtualDirectory "$HostName\PowerShell (Default Web Site)").ExternalUrl)
   ```

After you've configured the internal URL on the Mailbox server virtual directories, you need to configure your private DNS records for Outlook on the web and other connectivity. Depending on your configuration, you'll need to configure your private DNS records to point to the internal or external IP address or FQDN of your Mailbox server. Examples of recommended DNS records that you should create are described in the following table:

FQDN	DNS RECORD TYPE	VALUE
Mail.contoso.com	CNAME	Mailbox01.corp.contoso.com
Owa.contoso.com	CNAME	Mailbox01.corp.contoso.com

How do you know this step worked?

To verify that you've successfully configured the internal URL on the Mailbox server virtual directories, do the following:

1. In the EAC, go to **Servers** > **Virtual directories**.
2. In the **Select server** field, select the internet-facing Mailbox server.
3. Select a virtual directory and then click **Edit** ✎.
4. Verify that the **Internal URL** field is populated with the correct FQDN and service as shown in the following table:

VIRTUAL DIRECTORY	INTERNAL URL VALUE
Autodiscover	No internal URL displayed
ECP	https://owa.contoso.com/ecp
EWS	https://mail.contoso.com/EWS/Exchange.asmx
Microsoft-Server-ActiveSync	https://mail.contoso.com/Microsoft-Server-ActiveSync
OAB	https://mail.contoso.com/OAB
OWA	https://owa.contoso.com/owa
PowerShell	http://mail.contoso.com/PowerShell

To verify that you have successfully configured your private DNS records, do the following:

1. Open a command prompt and run `nslookup.exe`.
2. Change to a DNS server that can query your private DNS zone.
3. In `nslookup`, look up the record of each FQDN you created. Verify that the value that's returned for each FQDN is correct.

Configure different internal and external URLs

1. Open the EAC, and go to **Servers** > **Virtual directories**,
2. On the internet-facing Mailbox server, select the virtual directory that you want to configure, and then click **Edit** ✎.
3. The virtual directory properties window opens. In the **Internal URL** field, replace the existing host name value in the URL (likely, the FQDN of the Mailbox server) with the new value that you want to use (for example, internal.contoso.com).

   For example, in the properties of the Exchange Web Services (EWS) virtual directory, change the existing value from https://**Mailbox01.corp.contoso.com**/ews/exchange.asmx to https://**internal.contoso.com**/ews/exchange.asmx.

When you're finished, click **Save**.

4. Repeat the previous steps for each virtual directory you want to change.

> **NOTE**
>
> The ECP and OWA virtual directory internal URLs must be the same. You can't set an internal URL on the Autodiscover virtual directory.

After you've configured the internal URL on the Mailbox server virtual directories, you need to configure your private DNS records for Outlook on the web, and other connectivity. Depending on your configuration, you'll need to configure your private DNS records to point to the internal or external IP address or FQDN of your Mailbox server. An example of the recommended DNS record that you should create is described in the following table:

FQDN	DNS RECORD TYPE	VALUE
internal.contoso.com	CNAME	Mailbox01.corp.contoso.com

How do you know this step worked?

To verify that you've successfully configured the internal URLs in the Client Access services virtual directories on the Mailbox server, do the following steps:

1. In the EAC, go to **Servers** > **Virtual directories**.

2. In the **Select server** field, select the internet-facing Mailbox server.

3. Select a virtual directory and then click **Edit** ✎.

4. Verify that the **Internal URL** field is populated with the correct FQDN. For example, you may have set the internal URLs to use internal.contoso.com.

VIRTUAL DIRECTORY	INTERNAL URL VALUE
Autodiscover	No internal URL displayed
ECP	https://internal.contoso.com/ecp
EWS	https://internal.contoso.com/EWS/Exchange.asmx
Microsoft-Server-ActiveSync	https://internal.contoso.com/Microsoft-Server-ActiveSync
OAB	https://internal.contoso.com/OAB
OWA	https://internal.contoso.com/owa
PowerShell	http://internal.contoso.com/PowerShell

To verify that you've successfully configured your private DNS records, do the following:

1. Open a command prompt and run `nslookup.exe`.

2. Change to a DNS server that can query your private DNS zone.

3. In `nslookup`, look up the record of each FQDN you created. Verify that the value that's returned for each FQDN is correct.

Step 6: Configure an SSL certificate

Some services, such as Outlook Anywhere and Exchange ActiveSync, require certificates to be configured on your Exchange server. The following steps show you how to configure an SSL certificate from a third-party certificate authority (CA):

1. Create an Exchange Server certificate request for a certification authority.
    - You should request a certificate from a third-party CA so your clients automatically trust the certificate. For more information, see Best practices for Exchange certificates.
    - If you configured your internal and external URLs to be the same, **Outlook on the web (when accessed from the internet)** and **Outlook on the web (when accessed from the Intranet)** should both show owa.contoso.com. **OAB (when accessed from the internet)** and **OAB (when accessed from the Intranet)** should show mail.contoso.com.
    - If you configured the internal URLs to be internal.contoso.com, **Outlook on the web (when accessed from the internet)** should show owa.contoso.com and **Outlook on the web (when accessed from the Intranet)** should show internal.contoso.com.
2. Complete a pending Exchange Server certificate request.
3. Assign certificates to Exchange Server services
    - At minimum, you should select **SMTP** and **IIS**.
    - If you receive the warning **Overwrite the existing default SMTP certificate?**, click **Yes**.

How do you know this step worked?

To verify that you've successfully added a new certificate, do the following steps:

1. In the EAC, go to **Servers** > **Certificates**.
2. Select the new certificate and then, in the certificate details pane, verify that the following are true:
    - **Status** shows **Valid**
    - **Assigned to services** shows, at minimum, **IIS** and **SMTP**.

How do you know this task worked?

To verify that you've configured mail flow and external client access, do the following steps:

1. In Outlook, on an Exchange ActiveSync device, or on both, create a new profile. Verify that Outlook or the mobile device successfully creates the new profile.
2. In Outlook, or on the mobile device, send a new message to an external recipient. Verify the external recipient receives the message.
3. In the external recipient's mailbox, reply to the message you just sent from the Exchange mailbox. Verify the Exchange mailbox receives the message.
4. Go to https://owa.contoso.com/owa and verify that there are no certificate warnings.

Verify Exchange Server installations

8/3/2020 • 2 minutes to read • Edit Online

After you install Exchange Server 2016 or Exchange Server 2019, we recommend that you verify the installation by running the **Get-ExchangeServer** cmdlet and by reviewing the Exchange Setup log. If the setup process fails or errors occur during installation, you can use the Setup log to find the source of the problem.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Run Get-ExchangeServer

To verify that Exchange installed successfully, run the following commands in the Exchange Management Shell. To open the Exchange Management Shell, see Open the Exchange Management Shell.

This command returns a summary list of the names, Active Directory sites, Exchange server roles, Exchange editions, and Exchange versions of all Exchange servers in the organization.

```
Get-ExchangeServer
```

This example returns additional details about the Exchange server named Mailbox01.

```
Get-ExchangeServer -Identity Mailbox01 | Format-List
```

For detailed syntax and parameter information, see Get-ExchangeServer.

Review the Windows Application log and the Exchange Setup log

- Exchange Setup logs events in the **Application** log of the Windows Server. This log contains a history of each action that the system takes during Exchange setup and any errors that occurred (By default, the logging method is set to Verbose). You can use the Windows **Event Viewer** to find the messages related to Exchange setup.

- The Exchange Setup log is available at *<system drive>*:\ExchangeSetupLogs\ExchangeSetup.log (*<system drive>* is the drive where Windows is installed). The Setup log tracks the progress of every task during the Exchange installation and configuration. The file contains information about the status of the prerequisite and system readiness checks before installation starts, the application installation progress, and the configuration changes that are made to the system. Check this log file to verify that Exchange was installed as expected.

We recommend that you start your review of the Windows Application log and/or the Exchange Setup log by searching for errors. If you find an error entry, read the associated text to determine the cause of the error.

Install the Exchange management tools

8/3/2020 • 5 minutes to read • Edit Online

The management tools in Exchange Server 2016 and Exchange Server 2019 include the Exchange Management Shell and the Exchange Toolbox. You can install the management tools on other client computers or servers in the Active Directory domain to help you manage your Exchange organization. The management tools have similar operating system, .NET Framework, and Windows Management Framework (Windows PowerShell) requirements as an Exchange server. The notable exception is: you can install the management tools on client versions of Windows. For more information, see Exchange Server system requirements and Exchange Server prerequisites.

> **NOTE**
>
> The management tools don't include the Exchange admin center (EAC). The EAC is a web-based console that's hosted on Exchange 2016 Mailbox servers, and like any web site, you can access the EAC from other computers. For more information about the EAC, see Exchange admin center in Exchange Server.

For more information about the Exchange Management Shell, see Exchange Server PowerShell (Exchange Management Shell).

What do you need to know before you begin?

- Estimated time to complete: 20 minutes
- The computer where you want to install the Exchange management tools requires access to Setup.exe in the Exchange installation files. To download the latest version of Exchange, see Updates for Exchange Server.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

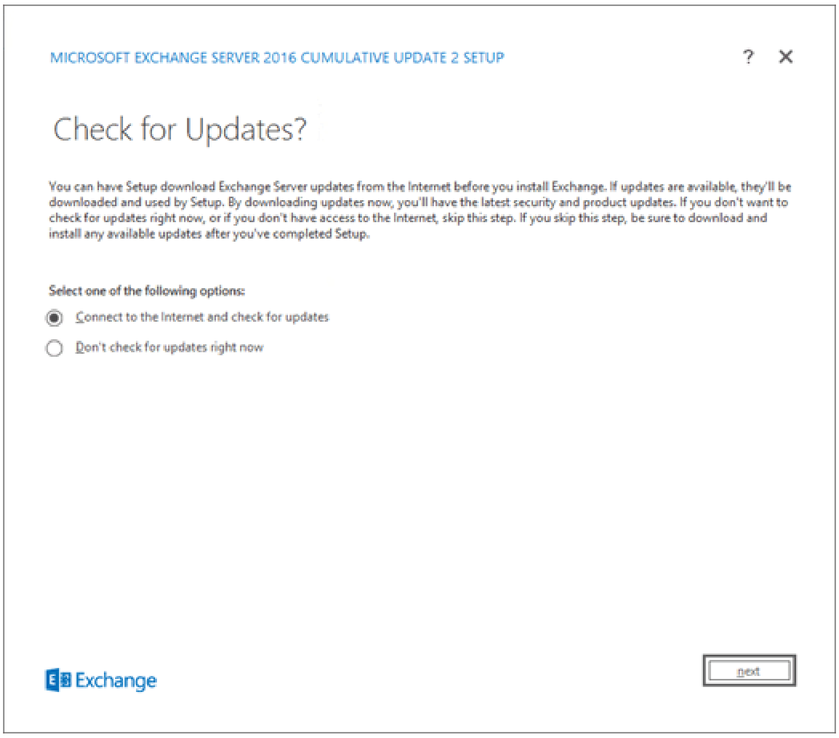
Use the Exchange 2016 Setup wizard to install the Exchange management tools

1. In File Explorer on the computer where you want to install the management tools, right-click on the Exchange ISO image file that you downloaded, and then select **Mount**. In the resulting virtual DVD drive that appears, start Exchange Setup by double-clicking `Setup.exe`.

2. The Exchange Server Setup wizard opens. On the **Check for Updates?** page, choose one of the following options, and then click **Next** to continue:

   Connect to the Internet and check for updates: We recommend this option, which searches for updates to the version of Exchange *that you're currently installing* (it doesn't detect newer Cumulative Updates). This option takes you to the **Downloading Updates** page that searches for updates. Click **Next** to continue.

   - **Don't check for updates right now**



MICROSOFT EXCHANGE SERVER 2016 CUMULATIVE UPDATE 2 SETUP

Check for Updates?

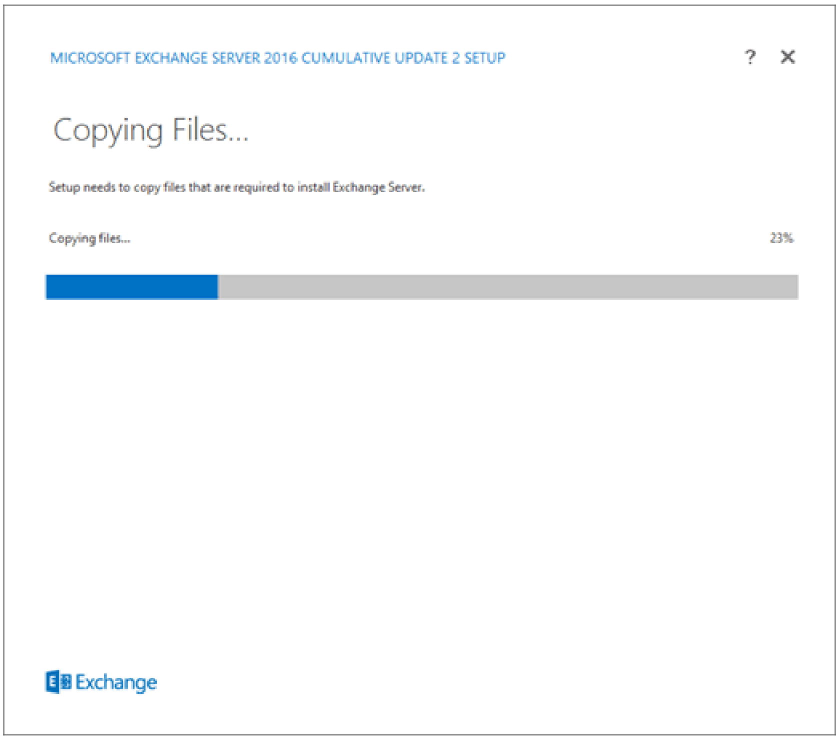
You can have Setup download Exchange Server updates from the Internet before you install Exchange. If updates are available, they'll be downloaded and used by Setup. By downloading updates now, you'll have the latest security and product updates. If you don't want to check for updates right now, or if you don't have access to the Internet, skip this step. If you skip this step, be sure to download and install any available updates after you've completed Setup.

Select one of the following options:

● Connect to the Internet and check for updates

○ Don't check for updates right now

3. The **Copying Files** page shows the progress of copying files to the local hard drive. Typically, the files are copied to `%WinDir%\Temp\ExchangeSetup`, but you can confirm the location in the Exchange Setup log at `C:\ExchangeSetupLogs\ExchangeSetup.log`.



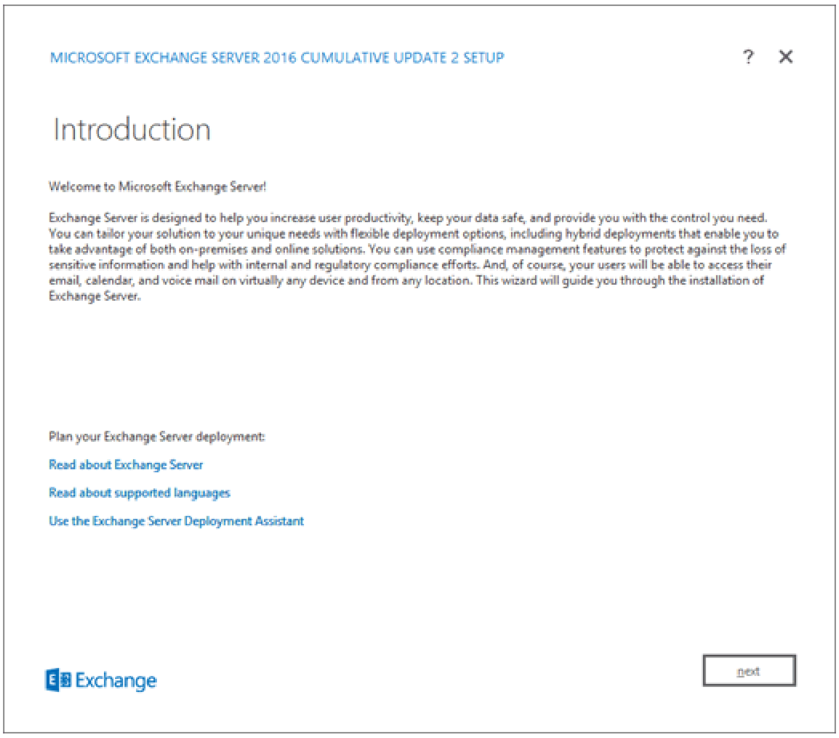
MICROSOFT EXCHANGE SERVER 2016 CUMULATIVE UPDATE 2 SETUP

Copying Files...

Setup needs to copy files that are required to install Exchange Server.

Copying files... 23%

4. On the **Introduction** page, click **Next** to continue.



Introduction

Welcome to Microsoft Exchange Server!

Exchange Server is designed to help you increase user productivity, keep your data safe, and provide you with the control you need. You can tailor your solution to your unique needs with flexible deployment options, including hybrid deployments that enable you to take advantage of both on-premises and online solutions. You can use compliance management features to protect against the loss of sensitive information and help with internal and regulatory compliance efforts. And, of course, your users will be able to access their email, calendar, and voice mail on virtually any device and from any location. This wizard will guide you through the installation of Exchange Server.

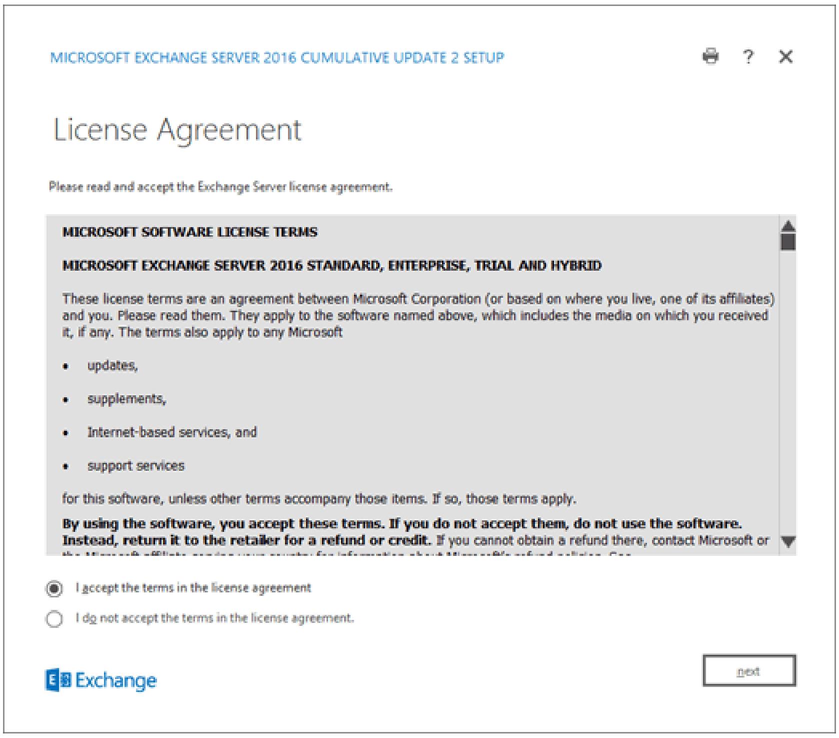
Plan your Exchange Server deployment:

Read about Exchange Server

Read about supported languages

Use the Exchange Server Deployment Assistant

5. On the **License Agreement** page, review the software license terms, select **I accept the terms in the license agreement**, and then click **Next** to continue.



License Agreement

Please read and accept the Exchange Server license agreement.

MICROSOFT SOFTWARE LICENSE TERMS

MICROSOFT EXCHANGE SERVER 2016 STANDARD, ENTERPRISE, TRIAL AND HYBRID

These license terms are an agreement between Microsoft Corporation (or based on where you live, one of its affiliates) and you. Please read them. They apply to the software named above, which includes the media on which you received it, if any. The terms also apply to any Microsoft

- updates,
- supplements,
- Internet-based services, and
- support services

for this software, unless other terms accompany those items. If so, those terms apply.

By using the software, you accept these terms. If you do not accept them, do not use the software. Instead, return it to the retailer for a refund or credit. If you cannot obtain a refund there, contact Microsoft or

● I accept the terms in the license agreement

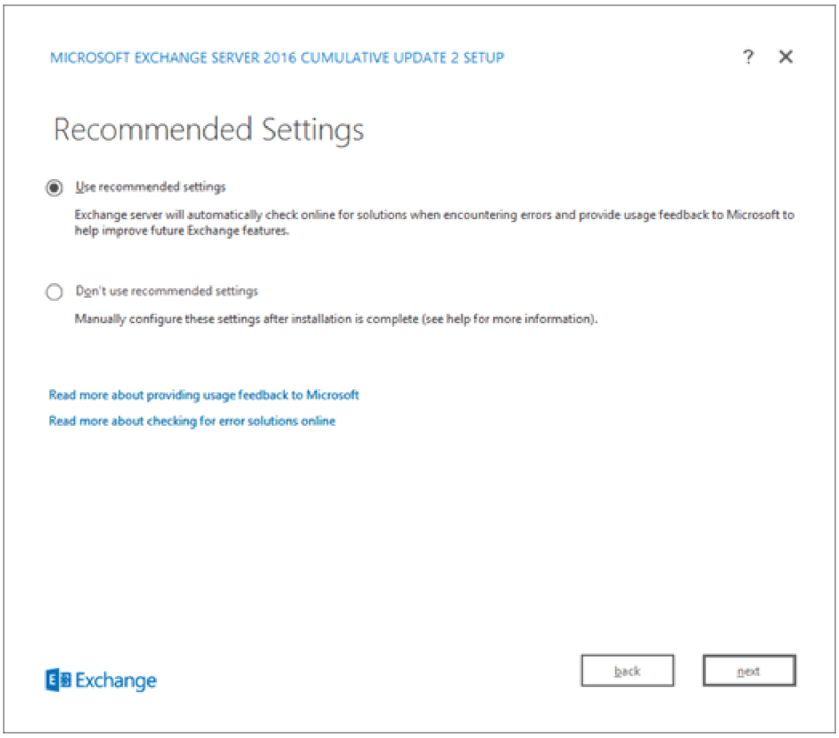
○ I do not accept the terms in the license agreement.

6. On the **Recommended Settings** page, choose one of the following settings:

   - **Use recommended settings**: Exchange automatically sends error reports and information about your computer hardware and how you use Exchange to Microsoft. For information about what's sent to Microsoft and how it's used, click **?** or the help links on the page.

   - **Don't use recommended settings**: These settings are disabled, but you can enable them at any time after Setup completes.

   Click **Next** to continue.



Recommended Settings

● Use recommended settings

Exchange server will automatically check online for solutions when encountering errors and provide usage feedback to Microsoft to help improve future Exchange features.

○ Don't use recommended settings

Manually configure these settings after installation is complete (see help for more information).

Read more about providing usage feedback to Microsoft

Read more about checking for error solutions online

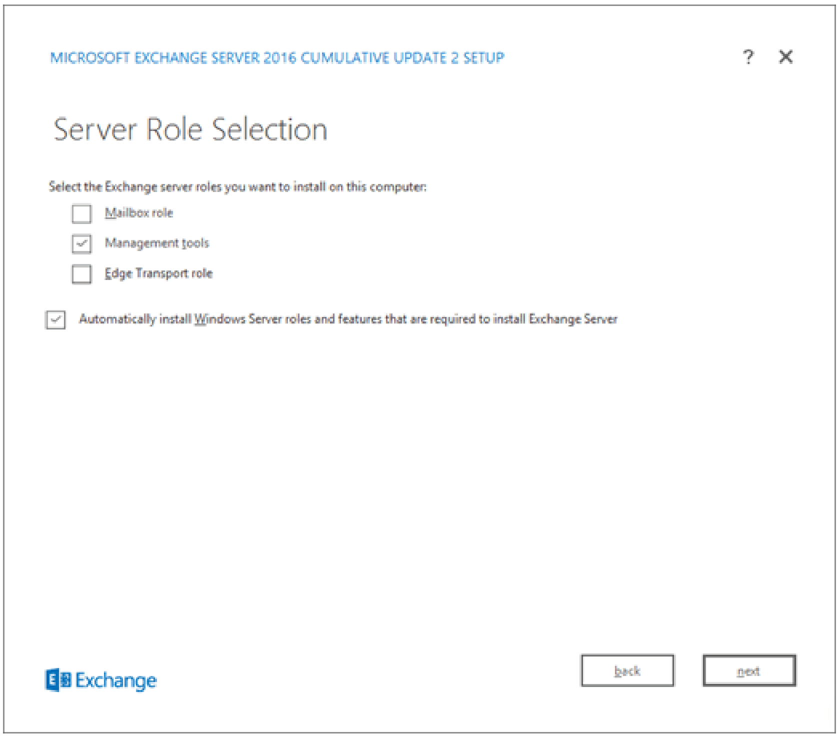
7. On the **Server Role Selection** page, configure the following settings:

   - Select **Management tools**.

   - **Automatically install Windows Server roles and features that are required to install Exchange**: Select this option to have the Setup wizard install the required Windows prerequisites. You might need to reboot the computer to complete the installation of some Windows features. If you don't select this option, you need to install the Windows features manually.

     Note: Selecting this option installs only the *Windows features* that are required by Exchange. You need to install other prerequisites manually. For more information, see Exchange Server prerequisites.

   Click **Next** to continue.



Server Role Selection

Select the Exchange server roles you want to install on this computer:

□ Mailbox role

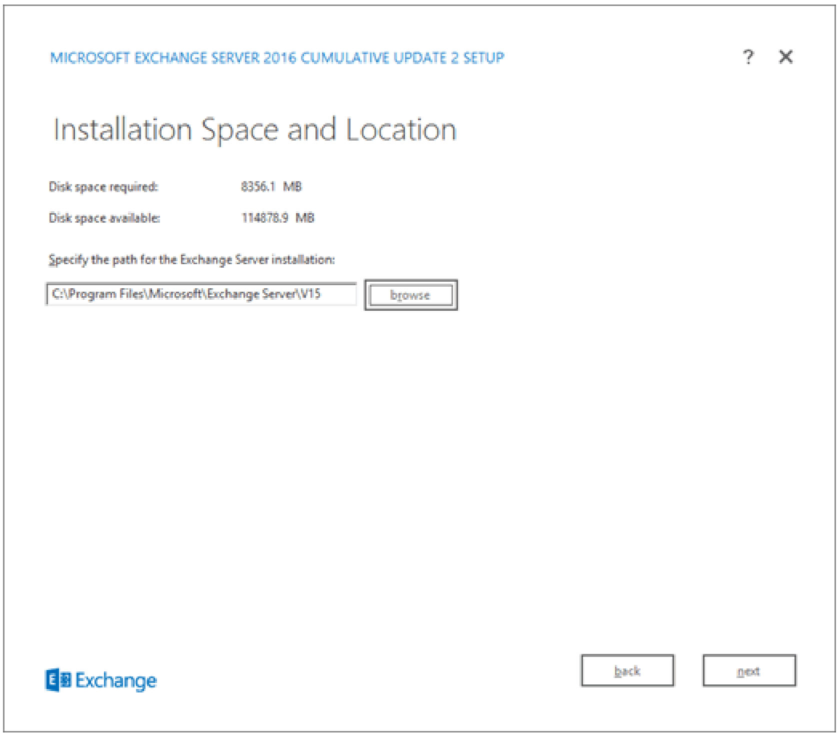
☑ Management tools

□ Edge Transport role

☑ Automatically install Windows Server roles and features that are required to install Exchange Server

8. On the **Installation Space and Location** page, either accept the default installation location (

`C:\Program Files\Microsoft\Exchange Server\V15`), or click **Browse** to choose a new location. Make sure that you have enough disk space available in the location where you want to install the management tools. Click **Next** to continue.



MICROSOFT EXCHANGE SERVER 2016 CUMULATIVE UPDATE 2 SETUP

Installation Space and Location

Disk space required: 8356.1 MB

Disk space available: 114878.9 MB

Specify the path for the Exchange Server installation:

C:\Program Files\Microsoft\Exchange Server\V15

9. If this is the first installation of Exchange in your organization (Exchange server or the management tools), you arrive on the **Exchange Organization** page. On this page, configure the following settings:

   - **Specify the name for this Exchange organization**: The default value is **First Organization**, but you typically use the company name for this value. The organization name is used internally by Exchange, isn't typically seen by users, doesn't affect the functionality of Exchange, and doesn't determine what you can use for email addresses.

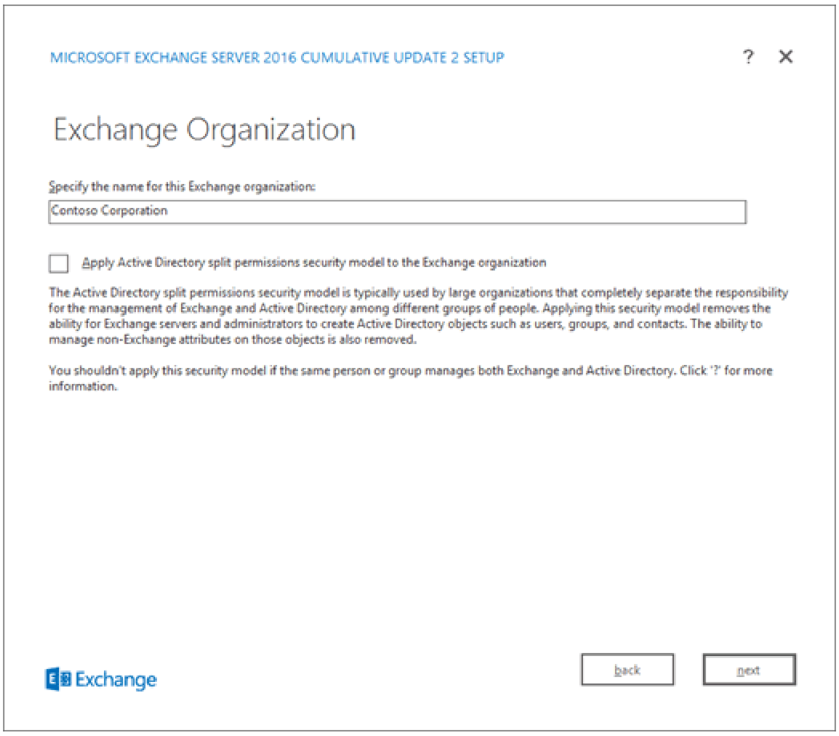
     - The organization name can't contain more than 64 characters, and can't be blank.

     - Valid characters are A to Z, a to z, 0 to 9, hyphen or dash (-), and space, but leading or trailing spaces aren't allowed.

     - You can't change the organization name after it's set.

   - **Apply Active Directory split permission security model to the Exchange organization**: Most organizations don't need to select this option. If you need to separate management of Active Directory security principals and the Exchange configuration, split permissions might work for you. For more information, click **?**.

   Click **Next** to continue.



Exchange Organization

Specify the name for this Exchange organization:

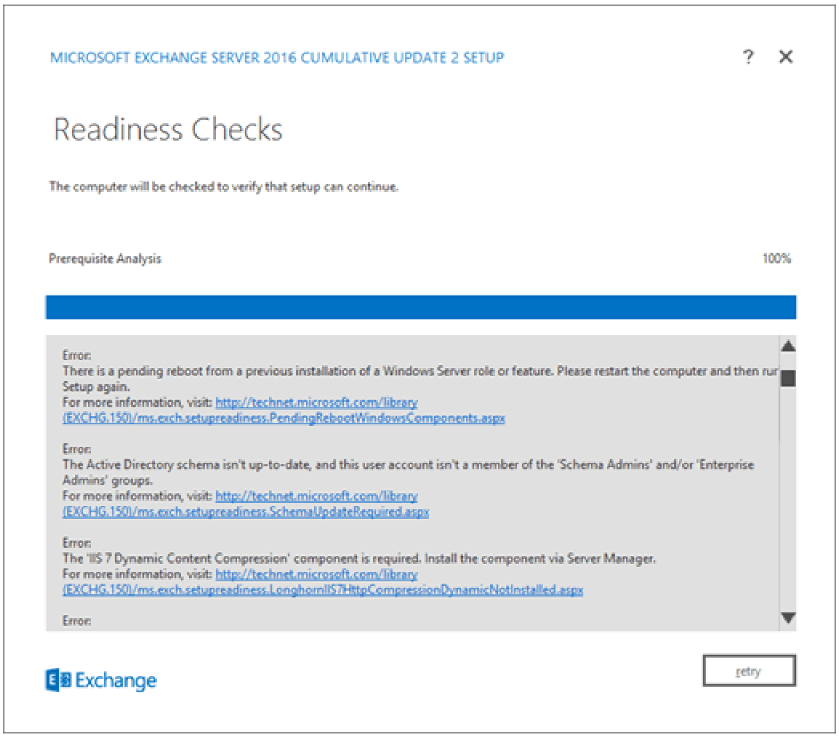
Contoso Corporation

□ Apply Active Directory split permissions security model to the Exchange organization

The Active Directory split permissions security model is typically used by large organizations that completely separate the responsibility for the management of Exchange and Active Directory among different groups of people. Applying this security model removes the ability for Exchange servers and administrators to create Active Directory objects such as users, groups, and contacts. The ability to manage non-Exchange attributes on those objects is also removed.

You shouldn't apply this security model if the same person or group manages both Exchange and Active Directory. Click '?' for more information.

10. On the **Readiness Checks** page, verify that the organization and server role prerequisite checks completed successfully. If they haven't, the only option on the page is **Retry**, so you need to resolve the errors before you can continue.



Readiness Checks

The computer will be checked to verify that setup can continue.

Prerequisite Analysis 100%

Error:
There is a pending reboot from a previous installation of a Windows Server role or feature. Please restart the computer and then rur
Setup again.
For more information, visit: http://technet.microsoft.com/library
(EXCHG.150)/ms.exch.setupreadiness.PendingRebootWindowsComponents.aspx

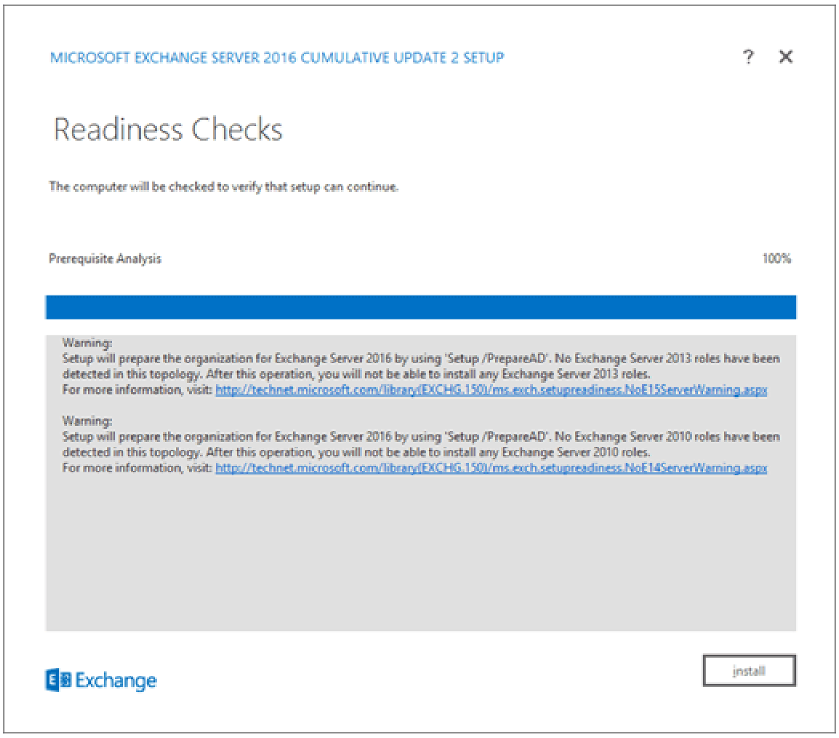
Error:
The Active Directory schema isn't up-to-date, and this user account isn't a member of the 'Schema Admins' and/or 'Enterprise Admins' groups.
For more information, visit: http://technet.microsoft.com/library
(EXCHG.150)/ms.exch.setupreadiness.SchemaUpdateRequired.aspx

Error:
The 'IIS 7 Dynamic Content Compression' component is required. Install the component via Server Manager.
For more information, visit: http://technet.microsoft.com/library
(EXCHG.150)/ms.exch.setupreadiness.LonghornIIS7HttpCompressionDynamicNotInstalled.aspx

Error:

After you resolve the errors, click **Retry** to run the prerequisite checks again. You can fix some errors without exiting Setup, while the fix for other errors requires you to restart the computer. If you restart the computer, you need to start over at Step 2.

When no more errors are detected on the **Readiness Checks** page, the **Retry** button changes to **Install** so you can continue. Be sure to review any warnings, and then click **Install** to install the management tools.



Readiness Checks

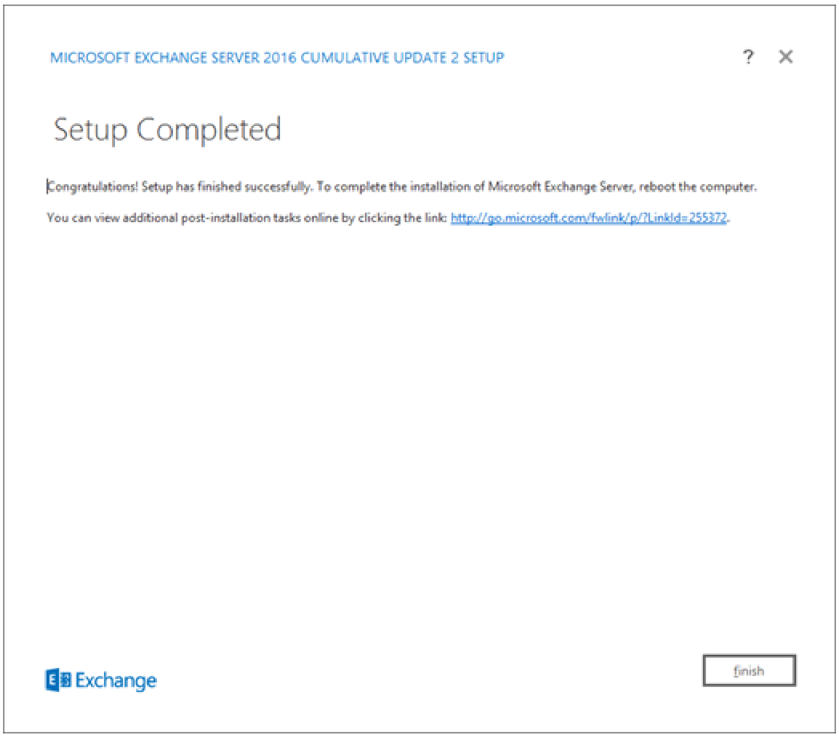
The computer will be checked to verify that setup can continue.

Prerequisite Analysis 100%

Warning:
Setup will prepare the organization for Exchange Server 2016 by using 'Setup /PrepareAD'. No Exchange Server 2013 roles have been detected in this topology. After this operation, you will not be able to install any Exchange Server 2013 roles.
For more information, visit: http://technet.microsoft.com/library(EXCHG.150)/ms.exch.setupreadiness.NoE15ServerWarning.aspx

Warning:
Setup will prepare the organization for Exchange Server 2016 by using 'Setup /PrepareAD'. No Exchange Server 2010 roles have been detected in this topology. After this operation, you will not be able to install any Exchange Server 2010 roles.
For more information, visit: http://technet.microsoft.com/library(EXCHG.150)/ms.exch.setupreadiness.NoE14ServerWarning.aspx

11. On the **Setup Completed** page, click **Finish**, and then restart the computer.



Setup Completed

Congratulations! Setup has finished successfully. To complete the installation of Microsoft Exchange Server, reboot the computer.

You can view additional post-installation tasks online by clicking the link: http://go.microsoft.com/fwlink/p/?LinkId=255372.

Use Exchange unattended Setup mode to install the Exchange management tools

1. In File Explorer on the computer where you want to install the Exchange management tools, right-click on the Exchange ISO image file that you downloaded, and then select **Mount**.

2. To install the Exchange management tools from the command line, use the following syntax in elevated command prompt (a Command Prompt window you opened by selecting **Run as administrator**):

```
<Virtual DVD drive letter>:\Setup.exe /IAcceptExchangeServerLicenseTerms /Role:ManagementTools
[/EnableErrorReporting] [/CustomerFeedbackEnabled:<True | False>] [/InstallWindowsComponents]
[/TargetDir:<Target folder>] [/OrganizationName:<Name>]
```

This example uses the Exchange Setup files on drive E: to install the management tools on the local server

```
E:\Setup.exe /IAcceptExchangeServerLicenseTerms /Role:ManagementTools
```

For more information, see Install Exchange using unattended mode.

Configure instant messaging integration with Outlook on the web in Exchange

8/3/2020 • 4 minutes to read • Edit Online

To configure instant messaging (IM) integration between Skype for Business Server and Outlook on the web (formerly known as Outlook Web App) in Exchange 2016 or Exchange 2019, you need to use the Exchange Management Shell. This is different than previous versions of Exchange where you needed to edit the web.config file. If you edit the web.config file instead of using the steps in this topic, the settings are ignored and Outlook on the web users receive the following error message:

```
There's a problem with instant messaging. Please try again later.
```

Also, the following health set errors are generated on the Exchange server:

- **HealthSet**: `OWA.Protocol.Dep`
- **Subject**:
  ```
  OWA.Protocol.Dep health set unhealthy (OwaIMInitializationFailedMonitor/OWA.Protocol.Dep) - Owa
  InstantMessaging provider failed to intialize
  ```
- **Message**:
  ```
  Owa InstantMessaging provider failed to initialize due to incorrect IM configuration on the server.
  Signin attempts to OWA IM will fail. Error Message: {Instant Messaging Certificate Thumbprint is null or
  empty on web.config).
  ```

Use the procedures in this topic to fix these errors and configure IM integration between Skype for Business Server and Exchange 2016 or Exchange 2019. IM integration between Lync Server 2013 and Exchange 2016 or later isn't supported. For details on setting up Skype for Business Server with Outlook on the web (formerly known as Outlook Web App), see Configure integration between on-premises Skype for Business Server and Outlook Web App

What do you need to know before you begin?

- Estimated time to complete: 5 minutes
- Exchange and Skype for Business integration requires server certificates that are trusted by all of the servers involved. The procedures in this topic assume that you already have the required certificates. For more information, see Plan to integrate Skype for Business Server 2015 and Exchange. The required IM certificate thumbprint refers to the Exchange Server certificate assigned to the IIS service.
- You can only use PowerShell to perform this procedure. To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Client Access virtual directory settings" entry in the Clients and mobile devices permissions topic.
- Depending on your Skype for Business Server topology, you may have multiple FrontEnd pools, you should pick the regional endpoint (closest pool to the exchange AD site): `IMServerName=<Skype Server\pool Name>`.

TIP

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the Exchange Management Shell to configure IM integration with Outlook on the web

Step 1: Specify the IM server and IM certificate thumbprint

Use the following syntax in the Exchange Management Shell to specify the IM server and IM certificate thumbprint:

```
New-SettingOverride -Name "<UniqueOverrideName>" -Component OwaServer -Section IMSettings -Parameters
@("IMServerName=<Skype server/pool  name>","IMCertificateThumbprint=<Certificate Thumbprint>") -Reason "
<DescriptiveReason>" [-Server <ServerName>]
```

Notes:

- To configure the same settings on all Exchange 2016 and Exchange 2019 servers in the Active Directory forest, don't use the *Server* parameter.
- To configure the settings on a specific Exchange 2016 or Exchange 2019 server, use the *Server* parameter and the name of the server (don't use the fully qualified domain name or FQDN). This method is useful when you need to specify different settings on different Exchange servers.

This example specifies the IM server and IM certificate thumbprint on all Exchange 2016 and Exchange 2019 servers in the organization.

- **Setting override name**: "IM Override" (must be unique)
- **Skype for Business server name**: skype01.contoso.com
- **Certificate thumbprint**: CDF34A740E9D225A1A06193A9D44B2CE22775308
- **Override reason**: Configure IM

```
New-SettingOverride -Name "IM Override"  -Component OwaServer -Section IMSettings -Parameters
@("IMServerName=skype01.contoso.com","IMCertificateThumbprint=CDF34A740E9D225A1A06193A9D44B2CE22775308") -
Reason "Configure IM"
```

This example specifies the IM server and IM certificate thumbprint, but only on the server named Mailbox01.

```
New-SettingOverride -Name "Mailbox01 IM Override"  -Component OwaServer -Section IMSettings -Parameters
@("IMServerName=skype01.contoso.com","IMCertificateThumbprint=CDF34A740E9D225A1A06193A9D44B2CE22775308") -
Reason "Configure IM" -Server Mailbox01
```

Step 2: Refresh the IM settings on the Exchange server

Use the following syntax in the Exchange Management Shell to refresh the IM settings on the server. You need to do this on every Exchange 2016 or Exchange 2019 server that's used for Outlook on the web.

```
Get-ExchangeDiagnosticInfo -Server <ServerName> -Process Microsoft.Exchange.Directory.TopologyService -
Component VariantConfiguration -Argument Refresh
```

This example refreshes the IM settings on the server named Mailbox01.

```
Get-ExchangeDiagnosticInfo -Server Mailbox01 -Process Microsoft.Exchange.Directory.TopologyService -Component
VariantConfiguration -Argument Refresh
```

Step 3: Restart the Outlook on the web pool on the Exchange server

Run the following command in the Exchange Management Shell or in Windows PowerShell on the server. You need to do this on every Exchange 2016 or Exchange 2019 server that's used for Outlook on the web.

```
Restart-WebAppPool MSExchangeOWAAppPool
```

How do you know this worked?

You'll know that you've successfully configured IM integration with Outlook on the web when the error message goes away, and clients are able to sign in to IM.

To verify the values of the **IMServerName** and **IMCertificateThumbprint** properties on an Exchange server, replace *<ServerName>* with the name of the server (not the FQDN), and run the following command:

```
[xml]$diag=Get-ExchangeDiagnosticInfo -Server <ServerName> -Process MSExchangeMailboxAssistants -Component
VariantConfiguration -Argument "Config,Component=OwaServer";
$diag.Diagnostics.Components.VariantConfiguration.Configuration.OwaServer.IMSettings
```

Note: In Exchange 2016 CU3 or earlier, you need to use different values for some of the parameters:

- *Process*: `Microsoft.Exchange.Directory.TopologyService` (instead of `MSExchangeMailboxAssistants`).
- *Argument*: `Config` (instead of `"Config,Component=OwaServer"`).

Change the offline address book generation schedule in Exchange

8/3/2020 • 3 minutes to read • Edit Online

An offline address book (OAB) is a copy of an address book that's been downloaded so that an Outlook user can access the information it contains while disconnected from the server. By default, a new OAB is generated every 8 hours in Exchange Server 2016 and Exchange Server 2019, but you can change the interval by using the Exchange Management Shell.

For additional management tasks related to OABs, see Procedures for offline address books in Exchange Server.

What do you need to know before you begin?

- Estimated time to complete this procedure: 5 minutes.
- You can only use PowerShell to perform this procedure. To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Offline address books" entry in the Email address and address book permissions topic.

> **TIP**
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Change the offline address book generation schedule

Changing the OAB generation schedule is a two-step process:

1. Change the OAB generation schedule.
2. Apply the new OAB generation schedule.

Step 1: Use the Exchange Management Shell to change the OAB generation schedule

To change the OAB generation schedule, use this syntax:

```
New-SettingOverride -Name "<UniqueOverrideName>" -Component TimeBasedAssistants -Section OABGeneratorAssistant
-Parameters @("WorkCycle=<Timespan>") -Reason "<DescriptiveReason>" [-Server <ServerName>]
```

Notes:

- To specify a *<TimeSpan>* value, use the syntax `d.hh:mm:ss`, where *d* = days, *hh* = hours, *mm* = minutes, and *ss* = seconds.
- To configure the OAB generation schedule on all Exchange 2016 and Exchange 2019 Mailbox servers in the Active Directory forest, don't use the *Server* parameter.
- To configure the OAB generation schedule on a specific Exchange 2016 or Exchange 2019 Mailbox server, use the *Server* parameter and the name (not the fully qualified domain name or FQDN) of the server. This

method is useful when you need to specify different OAB generation schedules on different Exchange servers.

- In Exchange 2016 Cumulative Update 3 (CU3) or earlier, the *Component* parameter value is `MailboxAssistants`.

This example specifies that the OAB is generated every two hours on all Exchange 2016 and Exchange 2019 servers in the organization that are responsible for generating OABs.

- **Setting override name**: "OAB Generation Override" (must be unique)
- **WorkCycle**: `02:00:00` (2 hours)
- **Override reason**: Generate OAB every 2 hours

```
New-SettingOverride -Name "OAB Generation Override" -Component TimeBasedAssistants -Section
OABGeneratorAssistant -Parameters @("WorkCycle=02:00:00") -Reason "Generate OAB every 2 hours"
```

This example specifies the same OAB generation schedule, but only on the server named Mailbox01.

```
New-SettingOverride -Name "Mailbox01 OAB Generation Override" -Component TimeBasedAssistants -Section
OABGeneratorAssistant -Parameters @("WorkCycle=02:00:00") -Reason "Generate OAB every 2 hours" -Server
Mailbox01
```

Step 2: Use the Exchange Management Shell to apply the new OAB generation schedule

To apply the new OAB generation schedule, use this syntax:

```
Get-ExchangeDiagnosticInfo -Process Microsoft.Exchange.Directory.TopologyService -Component
VariantConfiguration -Argument Refresh [-Server <ServerName>]
```

Notes:

- If you didn't use the *Server* parameter in Step 1, don't use it here. If you used the *Server* parameter in Step 1, use the same server name here.
- If you delete the custom OAB generation schedule by using the **Remove-SettingOverride** cmdlet, you still need to run this command to change the generation schedule back to the default value of 8 hours.

This example applies the new OAB generation schedule on all Exchange 2016 and Exchange 2019 Mailbox servers in the organization.

```
Get-ExchangeDiagnosticInfo -Process Microsoft.Exchange.Directory.TopologyService -Component
VariantConfiguration -Argument Refresh
```

This example applies the new OAB generation schedule on the server named Mailbox01.

```
Get-ExchangeDiagnosticInfo -Process Microsoft.Exchange.Directory.TopologyService -Component
VariantConfiguration -Argument Refresh -Server Mailbox01
```

How do you know this worked?

To verify that you've configured the OAB generation schedule on one or more Exchange servers, replace *<ServerName>* with the name of the server (not the FQDN), and run the following command to verify the value of the **WorkCycle** property:

```
[xml]$diag=Get-ExchangeDiagnosticInfo -Server <ServerName> -Process MSExchangeMailboxAssistants -Component
VariantConfiguration -Argument "Config,Component=TimeBasedAssistants";
$diag.Diagnostics.Components.VariantConfiguration.Configuration.TimeBasedAssistants.OABGeneratorAssistant
```

Note: In Exchange 2016 CU3 or earlier, you need to run this command instead:

```
[xml]$diag=Get-ExchangeDiagnosticInfo -Server <ServerName> -Process
Microsoft.Exchange.Directory.TopologyService -Component VariantConfiguration -Argument Config;
$diag.Diagnostics.Components.VariantConfiguration.Configuration.MailboxAssistants.OABGeneratorAssistant
```

.

Procedures for offline address books in Exchange Server

Configure certificate based authentication in Exchange 2016

8/3/2020 • 8 minutes to read • Edit Online

Certificate based authentication (CBA) in Exchange allows Outlook on the web (formerly known as Outlook Web App) and Exchange ActiveSync clients to be authenticated by client certificates instead of entering a username and password.

Before you configure Exchange, you need to issue a client certificate to each user. Because of the sheer number of certificates involved, you should use an automated internal public key infrastructure (PKI) to issue and manage the client certificates. An example of an automated internal PKI is Active Directory Certificate Services (AD CS). For more information about AD CS, see Active Directory Certificate Services Overview. Here's more information about the certificate requirements:

- The client certificate must be issued for client authentication (for example, the default **User** certificate template in AD CS).
- The client certificate must contain the user principal name (UPN) of the user (in the certificate's **Subject** or **Subject Alternative Name** fields).
- The client certificate must be associated with the user account in Active Directory.
- All servers and devices that are involved in access to Outlook on the web and ActiveSync (including proxy servers and client devices) must trust the entire chain of trust for the client certificates (the root certificate of the certification authority, and any intermediate CAs that were used to issue certificates).

For CBA in Outlook on the web, the client certificate needs to be installed on the local computer, device, or on a smart card. For CBA in ActiveSync, the client certificate needs to be installed on the local device. You can automate the installation of certificates on devices by using a mobile device management (MDM) solution like Intune. For more information about Intune, see Overview of Microsoft Intune.

What do you need to know before you begin?

- Estimated time to complete this task: 20 minutes
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "IIS Manager" entry in the Outlook on the web permissions section of the Clients and mobile devices permissions topic.
- To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Step 1: Use the Exchange Management Shell to install the Client

Certificate Mapping Authentication feature on all of your Exchange servers

All Exchange servers that share the same namespace and URLs need to use the same authentication methods. You need to install the Client Certificate Mapping Authentication feature on all of your Exchange servers.

In the Exchange Management Shell, run the following command:

```
Install-WindowsFeature Web-Client-Auth
```

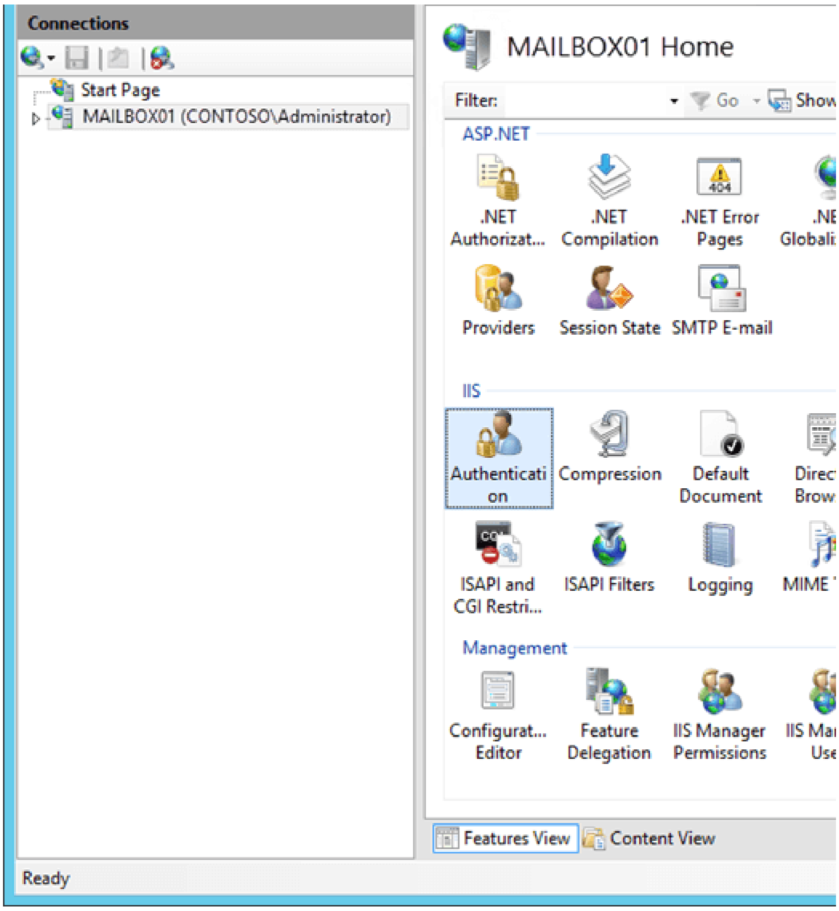
For detailed syntax and parameter information, see Install-WindowsFeature.

Step 2: Use IIS Manager to enable Active Directory Client Certificate Authentication for the Exchange server

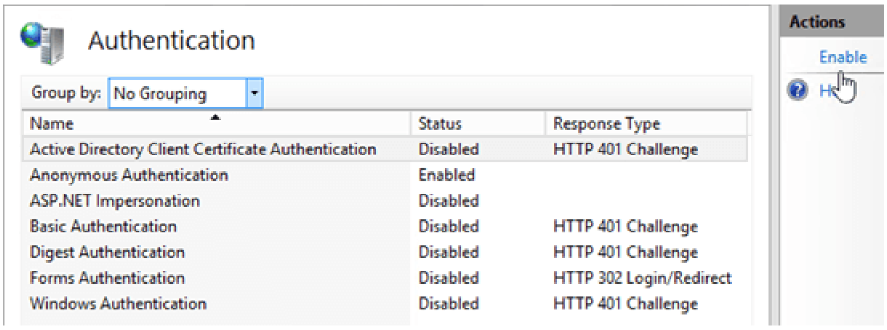
1. Open IIS Manager on the Exchange server. An easy way to do this in Windows Server 2012 or later is to press Windows key + Q, type inetmgr, and select **Internet Information Services (IIS) Manager** in the results.

2. Select the server, and verify **Features View** is selected at the bottom of the page.

3. In the **IIS** section, double-click **Authentication**.



4. On the **Authentication** page that opens, select **Active Directory Client Certificate Authentication** from the list, and in the **Actions** pane, click **Enable**.



Group by: No Grouping

Name	Status	Response Type
Active Directory Client Certificate Authentication	Disabled	HTTP 401 Challenge
Anonymous Authentication	Enabled	
ASP.NET Impersonation	Disabled	
Basic Authentication	Disabled	HTTP 401 Challenge
Digest Authentication	Disabled	HTTP 401 Challenge
Forms Authentication	Disabled	HTTP 302 Login/Redirect
Windows Authentication	Disabled	HTTP 401 Challenge

You'll see a warning that SSL must be enabled to use Active Directory Client Certificate Mapping.

Step 3: Use IIS Manager to configure the Outlook on the web, Exchange admin center, and ActiveSync virtual directories to require client certificates

Note: You need to *require* client certificates, because *accepting* client certificates (to support both CBA and regular username and password authentication) doesn't work consistently across all types of ActiveSync devices.

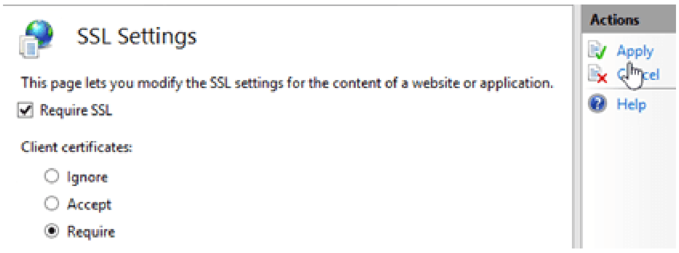
1. In IIS Manager, expand the server, expand **Sites**, and then expand **Default Web Site**.

2. Select the **owa** virtual directory, and verify **Features View** is selected at the bottom of the page.

3. In the **IIS** section, double-click **SSL Settings**.

4. On the **SSL Settings** page, verify **Require SSL** is checked, and select the **Client certificates** value **Require**.

5. In the **Actions** pane, click **Apply**.



This page lets you modify the SSL settings for the content of a website or application.

☑ Require SSL

Client certificates:

○ Ignore

○ Accept

● Require

6. Select the **Microsoft-Server-ActiveSync** virtual directory.

7. In the **IIS** section, double-click **SSL Settings**.

8. On the **SSL Settings** page, verify **Require SSL** is checked, and select the **Client certificates** value **Require**.

9. In the **Actions** pane, click **Apply**.

Note: Although you can perform these procedures on the command line, the steps might not configure a required registry key. You can use the earlier procedures in IIS Manager (which will definitely set the registry key correctly), or you need to verify that the registry key `HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\HTTP\Parameters\SslBindingInfo\0.0.0.0:443` is set to the value `1` after you perform the procedures on the command line.

To perform these procedures on the command line, open an elevated command prompt on the Exchange server (a Command Prompt window you open by selecting **Run as administrator**) and run the following commands:

```
%windir%\system32\inetsrv\appcmd.exe set config "Default Web Site/owa/" -
section:system.webserver/security/access /sslFlags:"Ssl, SslRequireCert" /commit:apphost
```

```
%windir%\system32\inetsrv\appcmd.exe set config "Default Web Site/ecp/" -
section:system.webserver/security/access /sslFlags:"Ssl, SslRequireCert" /commit:apphost
```

```
%windir%\system32\inetsrv\appcmd.exe set config "Default Web Site/Microsoft-Server-ActiveSync/" -
section:system.webserver/security/access /sslFlags:"Ssl, SslRequireCert" /commit:apphost
```

Step 4: Use the Exchange Management Shell to disable authentication other authentication methods on the Outlook on the web, Exchange admin center, and ActiveSync virtual directories

After you require client certificates for authentication, you need to disable all other authentication methods on the Outlook on the web, Exchange admin center (EAC) and ActiveSync virtual directories. By default, only Basic authentication and Forms authentication are enabled.

1. In the Exchange Management Shell, replace *<ServerName>* with the name of your Exchange server, and run the following command to disable all other authentication methods on the Outlook on the web virtual directory:

   ```
   Set-OwaVirtualDirectory "<ServerName>\owa (Default Web Site)" -BasicAuthentication $false -
   WindowsAuthentication $false -DigestAuthentication $false -FormsAuthentication $false -
   AdfsAuthentication $false -OAuthAuthentication $false
   ```

   For detailed syntax and parameter information, see Set-OwaVirtualDirectory.

2. In the Exchange Management Shell, replace *<ServerName>* with the name of your Exchange server, and run the following command to disable all other authentication methods on the EAC virtual directory:

   ```
   Set-EcpVirtualDirectory "<ServerName>\ecp (Default Web Site)" -BasicAuthentication $false -
   WindowsAuthentication $false -DigestAuthentication $false -FormsAuthentication $false -
   AdfsAuthentication $false
   ```

   For detailed syntax and parameter information, see Set-EcpVirtualDirectory.

3. Replace *<ServerName>* with the name of your Exchange server, and run the following command to disable all other authentication methods on the ActiveSync virtual directory:

   ```
   Set-ActiveSyncVirtualDirectory "<ServerName>\Microsoft-Server-ActiveSync (Default Web Site)" -
   BasicAuthEnabled $false -WindowsAuthEnabled $false
   ```

   For detailed syntax and parameter information, see Set-ActiveSyncVirtualDirectory.

Step 5: Use IIS Manager to enable client certificate mapping for the Outlook on the web, Exchange admin center, and ActiveSync virtual directories

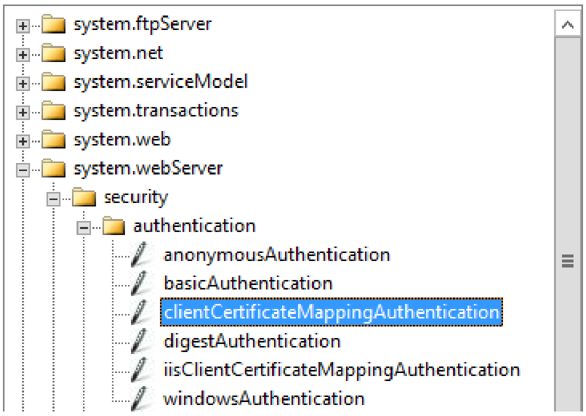
> **IMPORTANT**
>
> After you perform this step, running the **Set-ActiveSyncVirtualDirectory** cmdlet might disable the client certificate mapping for ActiveSync.

1. In IIS Manager, expand the server, expand **Sites**, and then expand **Default Web Site**.

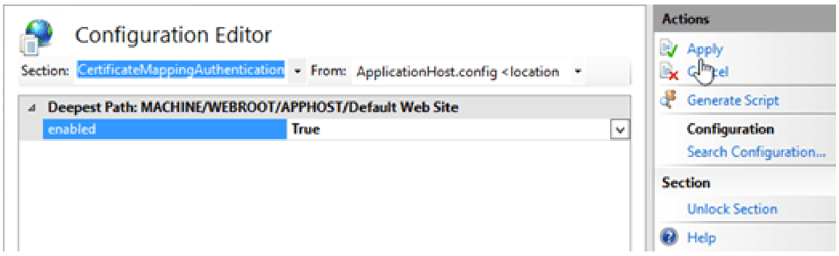
2. Select the **owa** virtual directory, and verify **Features View** is selected at the bottom of the page.

3. In the **Management** section, double-click **Configuration Editor**.

4. On the **Configuration Editor** page, click the drop down on **Section**, and navigate to **system.webServer** > **security** > **authentication** > **clientCertificateMappingAuthentication**.



5. Set the **enabled** value to **True**, and in the **Actions** pane, click **Apply**.



Configuration Editor

Section: CertificateMappingAuthentication From: ApplicationHost.config <location

Deepest Path: MACHINE/WEBROOT/APPHOST/Default Web Site

enabled True

6. Select the **ecp** virtual directory.

7. In the **Management** section, double-click **Configuration Editor**.

8. On the **Configuration Editor** page, click the drop down on **Section**, and navigate to **system.webServer** > **security** > **authentication** > **clientCertificateMappingAuthentication**.

9. Set the **enabled** value to **True**, and in the **Actions** pane, click **Apply**.

10. Select the **Microsoft-Server-ActiveSync** virtual directory.

11. In the **Management** section, double-click **Configuration Editor**.

12. On the **Configuration Editor** page, click the drop down on **Section**, and navigate to **system.webServer** > **security** > **authentication** > **clientCertificateMappingAuthentication**.

13. Set the **enabled** value to **True**, and in the **Actions** pane, click **Apply**.

Note: To perform these procedures on the command line, open an elevated command prompt on the Exchange server and run the following commands:

```
%windir%\system32\inetsrv\appcmd.exe set config "Default Web Site/owa/" -
section:system.webserver/security/authentication/clientCertificateMappingAuthentication /enabled:"True"
/commit:apphost
```

```
%windir%\system32\inetsrv\appcmd.exe set config "Default Web Site/ecp/" -
section:system.webserver/security/authentication/clientCertificateMappingAuthentication /enabled:"True"
/commit:apphost
```

```
%windir%\system32\inetsrv\appcmd.exe set config "Default Web Site/Microsoft-Server-ActiveSync/" -
section:system.webserver/security/authentication/clientCertificateMappingAuthentication /enabled:"True"
/commit:apphost
```

Step 6 (Optional): Add the root certificate of a third-party certification authority to the Enterprise NTAuth store in Active Directory

You only need to perform this step if you aren't using AD CS to issue the client certificates. This setting indicates that the certification authority (CA) is trusted to issue client certificates for Active Directory authentication.

1. Export the CA's root certificate to a Base-64 encoded or DER binary encoded X.509 .cer file. In this example, we'll use C:\Data\CARoot.cer.

2. On any domain member server (for example, a domain controller or an Exchange server), open an elevated command prompt run the following command:

   ```
   %windir%\system32\certutil.exe -enterprise -addstore NTAuth "C:\Data\CARoot.cer"
   ```

   Note that this step requires membership in the **Enterprise Admins** group.

Step 7 (Optional): Use IIS Manager to increase the UploadReadAheadSize value for the Outlook on the web and ActiveSync virtual directories

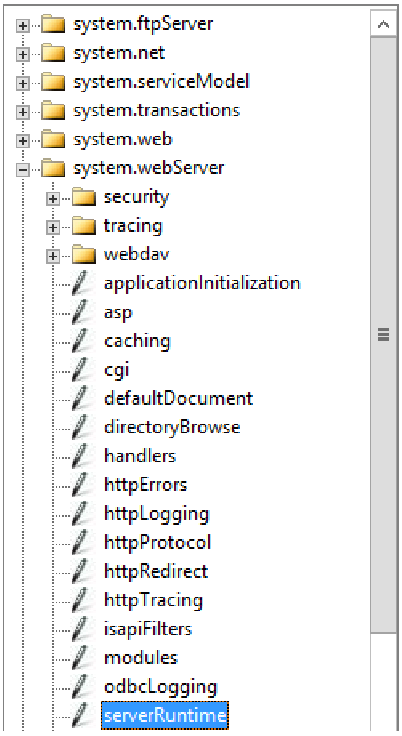
If your clients receive errors, you might need to increase the **uploadReadAheadSize** values in the IIS metabase to allow for the request headers.

1. In IIS Manager, expand the server, expand **Sites**, and then expand **Default Web Site**.

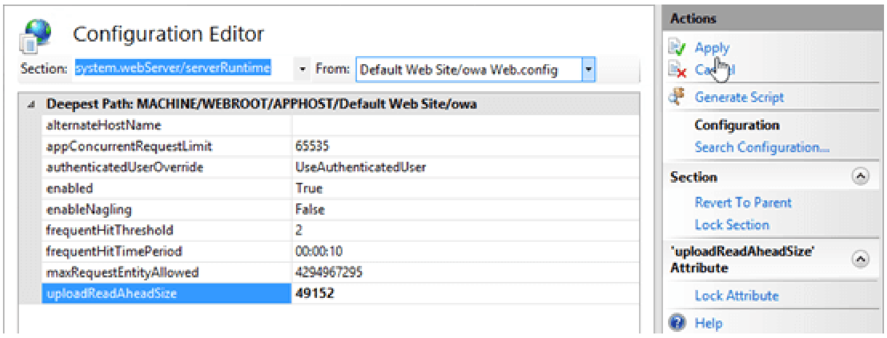
2. Select the **owa** virtual directory, and verify **Features View** is selected at the bottom of the page.

3. In the **Management** section, double-click **Configuration Editor**.

4. On the **Configuration Editor** page, click the drop down on **Section**, and navigate to **systemwebServer** > **serverRuntime**.



5. Set the **uploadReadAheadSize** value to 49152, and in the **Actions** pane, click **Apply**.



Section: system.webServer/serverRuntime From: Default Web Site/owa Web.config

Deepest Path: MACHINE/WEBROOT/APPHOST/Default Web Site/owa

alternateHostName	
appConcurrentRequestLimit	65535
authenticatedUserOverride	UseAuthenticatedUser
enabled	True
enableNagling	False
frequentHitThreshold	2
frequentHitTimePeriod	00:00:10
maxRequestEntityAllowed	4294967295
uploadReadAheadSize	49152

6. Select the **ecp** virtual directory.

7. In the **Management** section, double-click **Configuration Editor**.

8. On the **Configuration Editor** page, click the drop down on **Section**, and navigate to **systemwebServer** > **serverRuntime**.

9. Set the **uploadReadAheadSize** value to 49152, and in the **Actions** pane, click **Apply**.

10. Select the **Microsoft-Server-ActiveSync** virtual directory.

11. In the **Management** section, double-click **Configuration Editor**.

12. On the **Configuration Editor** page, click the drop down on **Section**, and navigate to **systemwebServer** > **serverRuntime**.

13. Set the **uploadReadAheadSize** value to 49152, and in the **Actions** pane, click **Apply**.

Note: To perform these procedures on the command line, open an elevated command prompt on the Exchange server and run the following commands:

```
%windir%\system32\inetsrv\appcmd.exe set config "Default Web Site/owa/" -
section:system.webserver/serverRuntime /uploadReadAheadSize:49152
```

```
%windir%\system32\inetsrv\appcmd.exe set config "Default Web Site/ecp/" -
section:system.webserver/serverRuntime /uploadReadAheadSize:49152
```

```
%windir%\system32\inetsrv\appcmd.exe set config "Default Web Site/Microsoft-Server-ActiveSync/" -
section:system.webserver/serverRuntime /uploadReadAheadSize:49152
```

Exchange Server readiness checks

8/3/2020 • 2 minutes to read • Edit Online

The topics in this are provide details about the readiness checks that Exchange Server performs when Exchange is installed. Readiness checks ensure that your Active Directory forest and Exchange servers are ready for the version of Exchange that you're installing. Each readiness check topic describes the actions that you can take to resolve issues that are found when the readiness checks are run. You should only perform the steps outlined in a readiness check topic if that readiness check was displayed during setup.

AD LDS directory exists in default location [ADAMDataPathExists]

8/3/2020 • 2 minutes to read • Edit Online

Exchange Setup can't continue because the attempt to install Active Directory Lightweight Directory Services (AD LDS) failed.

An older installation of AD LDS exists in the default location. Setup can't perform a new AD LDS install in an existing AD LDS directory structure.

To resolve this issue, remove the existing AD LDS directory and then run Setup again.

For more information about AD LDS directory management, see Administering AD LDS Directory Partitions.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

Duplicate Microsoft Exchange System Objects container exists in Active Directory [AdInitErrorRule]

8/3/2020 • 2 minutes to read • Edit Online

Exchange Setup can't continue because it found a duplicate Microsoft Exchange System Objects container in Active Directory Domain Naming context. When Setup finds a duplicate Microsoft Exchange System Objects container, you need to delete the duplicate container before Setup can continue. Note that running **DomainPrep** again won't fix the problem. You need to find and delete the duplicate Microsoft Exchange System Objects container.

To resolve this issue, do the following steps:

1. Open **Active Directory Users and Computers**. For example:

   - Press Windows key + R, enter **dsc.msc**, and then click **OK**.

   - In **Administrative Tools** > **Active Directory Users and Computers**.

2. In the **Active Directory Users and Computers**, click **View** > **Advanced Features**.

3. Locate the duplicate **Microsoft Exchange System Objects** container.

4. Verify that the duplicate **Microsoft Exchange System Objects** container doesn't contain valid Active Directory objects.

5. Right-click the duplicate **Microsoft Exchange System Objects container**, click **Delete**, and then click **Yes** in the confirmation dialog box.

> **NOTE**
>
> To immediately replicate the change, you need to manually initiate replication between domain controllers.

Failover Cluster Command Interface Windows feature not installed [RsatClusteringCmdInterfaceInstalled]

8/3/2020 • 2 minutes to read • Edit Online

Microsoft Exchange Server 2016 Setup can't continue because the local computer is missing a required Windows feature. You'll need to install this Windows feature before Exchange 2016 can continue.

Exchange 2016 Setup requires that the **Failover Cluster Command Interface** Windows feature be installed on the computer before installation can continue.

Do the following to install the Windows feature on this computer. If the feature requires a reboot to complete installation, you'll need to exit Exchange 2016 Setup, reboot, and then start Setup again.

> **NOTE**
>
> Additional Windows features or updates might need to be installed before Exchange 2016 Setup can continue. For a complete list of required Windows features and updates, check out Exchange Server prerequisites.

1. Open Windows PowerShell on the local computer.
2. Run the following command to install the required Windows feature.

```
Install-WindowsFeature RSAT-Clustering-CmdInterface
```

Active Directory does not exist or cannot be contacted [CannotAccessAD]

8/3/2020 • 2 minutes to read • Edit Online

Exchange Setup can't continue because it can't contact a valid Active Directory site. Setup requires that the target server is able to locate the configuration naming context in Active Directory.

To resolve this issue, verify that the account that you're using an Active Directory account to run Setup and then try running Setup again. If this doesn't resolve the issue, follow the guidance about using the support tools in the following topics to further diagnose the problem.

For more information about Active Directory troubleshooting and configuration for Exchange, see the following topics:

- Prepare Active Directory and domains
- Troubleshooting Active Directory Domain Services
- Configuring a Computer for Troubleshooting
- Troubleshooting Active Directory Replication Problems

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

The local computer isn't joined to an Active Directory domain [ComputerNotPartofDomain]

8/3/2020 • 2 minutes to read • Edit Online

Exchange Setup can't continue because it detected that the target server isn't a member of an Active Directory domain. You need to join the target server to an Active Directory domain before you can install the Mailbox server role. You might also see this message if you're using a local computer account instead of a domain user account (with the required permissions) to install Exchange.

For more information, see Exchange Server system requirements

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

Installation of the first Exchange server in the organization can't be delegated [DelegatedBridgeheadFirstInstall]

8/3/2020 • 2 minutes to read • Edit Online

Exchange Setup can't continue because this is the first Exchange server in the organization, and the first Exchange server needs to be installed by a member of the Enterprise Admins security group (to create the Exchange Organization container and configure objects in it).

Note: If you haven't already extended the Active Directory schema for Exchange, you need to do one of the following steps:

- A member of the Schema Admins group can extend the Active Directory schema using another computer in the domain before you install Exchange.
- Exchange Setup can extend the schema if your account is a member of the Schema Admins group.

To resolve this issue, run Exchange setup again using an account that's a member of the Enterprise Admins security group (add the current account or use a different account).

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

Installation of the first Exchange server in the organization can't be delegated [DelegatedCafeFirstInstall]

8/3/2020 • 2 minutes to read • Edit Online

Active Directory functional level isn't Windows Server 2003 or later [ForestLevelNotWin2003Native]

8/3/2020 • 2 minutes to read • Edit Online

Exchange Server 2016 Setup can't continue because the Active Directory forest functional level of the target forest isn't Windows Server 2003 native or later. Before you can install Exchange 2016, you must raise the forest functional level to Windows Server 2003 or later.

For information about how to raise the forest functional level, see Raise the Forest Functional Level.

For more information about Active Directory functional levels, see the following topics:

- What are Active Directory Functional Levels?
- How Active Directory Functional Levels Work

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

Cannot write to the Exchange organization container [GlobalServerInstall]

8/3/2020 • 2 minutes to read • Edit Online

Exchange Setup can't continue because the user account doesn't have the permissions that are required to write to the organization container in the Active Directory directory service.

Setup requires that the account you're using to install Exchange has permissions to create and modify objects in Active Directory:

- If this is the first Exchange server in your organizaiton, your account needs to be a member of the Schema Admins security group (to extend the schema) and the Enterprise Admins security group (to prepare Active Directory).
- After you prepare Active Directory for the version of Exchange that you're installing, your account needs to be a member of the Organization Management role group.

For more information, see Prepare Active Directory and domains for Exchange.

To resolve this issue, run Exchange setup again using an account that has the appropriate permissions (grant permissions to the current account or use a different account).

> **IMPORTANT**
>
> Cross-forest installation of Exchange isn't supported. Use an account in the Active Directory forest where you're installing Exchange.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

Global updates required [GlobalUpdateRequired]

8/3/2020 • 2 minutes to read • Edit Online

Exchange Setup can't continue because the user account doesn't have the permissions that are required to write to the organization container in the Active Directory directory service.

Setup requires that the account you're using to install Exchange has permissions to create and modify objects in Active Directory:

- If this is the first Exchange server in your organizaiton, your account needs to be a member of the Schema Admins security group (to extend the schema) and the Enterprise Admins security group (to prepare Active Directory).
- After you prepare Active Directory for the version of Exchange that you're installing, your account needs to be a member of the Organization Management role group.

For more information, see Prepare Active Directory and domains for Exchange.

To resolve this issue, run Setup again using an account that has the appropriate permissions (grant permissions to the current account or use a different account).

> **IMPORTANT**
> Cross-forest installation of Exchange isn't supported. Use an account in the Active Directory forest where you're installing Exchange.

The Host record for the local computer cannot be found in the DNS database [HostRecordMissing]

8/3/2020 • 2 minutes to read • Edit Online

Exchange Setup can't continue because the Host (A) record for this computer can't be found in the DNS zone for the domain. Setup requires a valid A record for the server, and Exchange uses email server A records to find the IP address of the next hop to send messages.

To resolve this issue:

- Verify that the local TCP/IP configuration points to the correct DNS server. For more information, see Configure TCP/IP settings.
- Use Nslookup.exe to verify that the Host (A) record exists on the DNS server. For more information, see To verify A resource records exist in DNS.

For information about DNS name resolution, troubleshooting, and A records, see the following:

- Troubleshooting DNS
- Managing resource records

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

Installation on domain controllers is not supported with Active Directory split permissions [InstallOnDCInADSplitPermissionMode]

8/3/2020 • 2 minutes to read • Edit Online

Exchange Setup detected that you're installing Exchange on an Active Directory domain controller and one of the following conditions is true:

- The Exchange organization is already configured for Active Directory split permissions.
- You selected the Active Directory split permissions option in Exchange Setup.

Installing Exchange on domain controllers isn't supported when the Exchange organization is configured for Active Directory split permissions. To install Exchange on a domain controller, you need to configure the Exchange organization for Role Based Access Control (RBAC) split permissions or shared permissions.

> **IMPORTANT**
>
> We don't recommend installing Exchange on Active Directory domain controllers. For more information, see Installing Exchange on a domain controller is not recommended [WarningInstallExchangeRolesOnDomainController].

If you want to use Active Directory split permissions, you need install Exchange on a member server.

For more information about split and shared permissions in Exchange 2013 or later, see the following topics:

- Understanding Split Permissions
- Configure Exchange 2013 for Split Permissions
- Configure Exchange 2013 for Shared Permissions

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

The current account isn't logged into an Active Directory domain [LoggedOntoDomain]

8/3/2020 • 2 minutes to read • Edit Online

Exchange Setup can't continue because it detected that the current account isn't logged on to an Active Directory domain. You need to log in using an Active Directory account that has the permissions required to install Exchange.

Setup requires that the account you're using to install Exchange has permissions to create and modify objects in Active Directory:

- If this is the first Exchange server in your organizaiton, your account needs to be a member of the Schema Admins security group (to extend the schema) and the Enterprise Admins security group (to prepare Active Directory).

- After you prepare Active Directory for the version of Exchange that you're installing, your account needs to be a member of the Organization Management role group.

For more information, see Prepare Active Directory and domains for Exchange.

To resolve this issue, run Setup again using an account that has the appropriate permissions (grant permissions to the current account or use a different account).

> **IMPORTANT**
>
> Cross-forest installation of Exchange isn't supported. Use an account in the Active Directory forest where you're installing Exchange.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

The computer needs to be restarted before Setup can continue [RebootPending]

8/3/2020 • 2 minutes to read • Edit Online

Exchange Setup can't continue because it detected a pending reboot to complete the installation of other programs or Windows updates.

Why is this happening?

When programs and Windows updates are installed, they make changes to files that are stored on your computer. Some programs or updates need to modify or replace files that are currently in use. When this happens, you need to restart the computer before other programs can be installed.

If the installation of a previous program or Windows update didn't complete successfully, Windows and other programs might think a restart is required. You'll continue to see this error each time you run Exchange Setup if this happens (the failed installation can't fix the condition that indicates a restart is required).

How do I fix it?

Typically, you only need to restart the server to get past this error, but you might get this error again after a restart (for example, additional program or Windows updates also require a restart). Try restarting the server again.

If you see this error after you've restarted the server more than two or three times, try reinstalling any programs or Windows updates that you've installed recently. This might allow a failed installation to complete successfully.

If you *still* receive this error after multiple restarts and reinstalling recent programs or Windows updates, we recommend that you contact Microsoft Customer Service and Support. They'll help you find the reason why Windows and other programs think your computer needs to be restarted. To contact Microsoft support, go to Support for business and select **Servers** > **Exchange Server**.

Caution

Although it's tempting, we strongly recommend that you don't attempt to work around this issue by manually deleting or changing registry keys or values. Although you might fix this issue now, manually modifying the registry might cause issues later on. This is especially important if the failed installation was a Windows update.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

The logged-on user is not a member of the Schema Admins group [SchemaUpdateRequired]

8/3/2020 • 2 minutes to read • Edit Online

Exchange Setup can't continue because the user account isn't a member of the Schema Admins and Enterprise Admins security groups.

Setup requires that the account you're using to install Exchange has permissions to create and modify objects in Active Directory:

- If this is the first Exchange server in your organizaiton, your account needs to be a member of the Schema Admins security group (to extend the schema) and the Enterprise Admins security group (to prepare Active Directory).
- After you prepare Active Directory for the version of Exchange that you're installing, your account needs to be a member of the Organization Management role group.

For more information, see Prepare Active Directory and domains for Exchange.

To resolve this issue, run Exchange setup again using an account that has the appropriate permissions (grant permissions to the current account or use a different account).

> **IMPORTANT**
>
> Cross-forest installation of Exchange isn't supported. Use an account in the Active Directory forest where you're installing Exchange.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

UCMA 4.0, Core Runtime not installed [UcmaRedistMsi]

8/3/2020 • 2 minutes to read • Edit Online

Exchange 2016 Setup requires the Unified Communications Managed API 4.0 Runtime for Unified Messaging (UM) services on the Mailbox server role. You need to install this update before Exchange 2016 Setup can continue.

Download and install the 64-bit update from Unified Communications Managed API 4.0 Runtime, and then click **Retry** on the **Readiness Checks** page in the Exchange 2016 Setup wizard.

> **NOTE**
>
> If the installation of this update requires a reboot, you'll need to exit Exchange 2016 Setup, reboot, and then start Setup again.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

Cannot remove mailbox database [UnwillingToRemoveMailboxDatabase]

8/3/2020 • 2 minutes to read • Edit Online

Exchange Setup can't continue because it can't remove a user mailbox database from the local server without incurring potential data loss.

Before Exchange Setup removes the Mailbox server role from a server, Setup confirms that all mailbox databases have been removed from the server, or that the mailboxes on the server don't contain active mailboxes. However, user mailboxes might still remain on the server.

To resolve this issue do either of these steps:

- To preserve the mailboxes and their content, move the mailboxes to another server. For instructions, see Mailbox moves in Exchange Server.
- Disable the mailboxes if they're no longer required. For more information, see Disable-Mailbox.
- Remove the mailbox databases if they're no longer required. For instructions, see Manage mailbox databases in Exchange Server.

After you deal with the mailbox databases on the server, run Exchange Setup again.

- For more information about how to identify a mailbox in the database, see Get-Mailbox.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

Installing Exchange on a domain controller is not recommended [WarningInstallExchangeRolesOnDomainController]

8/3/2020 • 2 minutes to read • Edit Online

Exchange Server 2016 or Exchange 2019 Setup has detected that the target computer is an Active Directory domain controller, and we don't recommed installing Exchange on domain controllers.

If you install Exchange on a domain controller, be aware of the following issues:

- Configuring Exchange for Active Directory split permissions isn't supported. For more information about split permissions, see Understanding split permissions.
- The Exchange Trusted Subsystem universal security group (USG) is added to the Domain Admins group. This action grants all Exchange servers domain administrator rights in the domain.
- Exchange Server and Active Directory are both resource-intensive applications. There are performance implications when both applications are running on the same computer.
- The domain controller must be a global catalog server, but Exchange services might not start correctly on a global catalog server.
- System shutdown will take considerably longer if Exchange you don't stop the Exchange services before you shut down or restart the server.
- Demoting the domain controller to a member server isn't supported.
- Running Exchange on a clustered node that's also an Active Directory domain controller isn't supported.

Therefore, we recommend that you install Exchange on a member server, not on a domain controller.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

KB2619234 update not installed [Win7RpcHttpAssocCookieGuidUpdateNotInstalled]

8/3/2020 • 2 minutes to read • Edit Online

Exchange Server 2016 Setup can't continue because the local computer requires a software update. You'll need to install this update before Exchange 2016 Setup can continue.

Exchange 2016 Setup requires a Windows Server update that allows Outlook Anywhere (RPC over HTTP) to work correctly.

Download and install the 64-bit update from KB2619234, and then click **retry** on the **Readiness Checks** page.

> **NOTE**
>
> If this update requires a reboot to complete installation, you'll need to exit Exchange 2016 Setup, reboot, and then start Setup again.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

Installation of the first Exchange server in the organization can't be delegated [DelegatedFrontendTransportFirstInstall]

8/3/2020 • 2 minutes to read • Edit Online

Exchange Setup can't continue because this is the first Exchange server in the organization, and the first Exchange server needs to be installed by a member of the Enterprise Admins security group (to create the Exchange Organization container and configure objects in it).

Note: If you haven't already extended the Active Directory schema for Exchange, you need to do one of the following steps:

- A member of the Schema Admins group can extend the Active Directory schema using another computer in the domain before you install Exchange.
- Exchange Setup can extend the schema if your account is a member of the Schema Admins group.

To resolve this issue, run Exchange setup again using an account that's a member of the Enterprise Admins security group (add the current account or use a different account).

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

No Exchange 2010 servers detected [NoE14ServerWarning]

8/3/2020 • 2 minutes to read • Edit Online

Microsoft Exchange Server 2016 Setup displayed this warning because no Exchange 2010 servers exist in the organization.

Caution

If you continue with Exchange Server 2016 installation, you won't be able to add Exchange 2010 servers to the organization in the future.

Before deploying Exchange 2016, consider the following factors that may require you to deploy Exchange 2010 servers prior to deploying Exchange 2016:

- **Third-party or in-house developed applications**: Applications developed for earlier versions of Exchange may not be compatible with Exchange 2016. You may need to maintain Exchange 2010 servers to support these applications.
- **Coexistence or migration requirements**: If you plan on migrating mailboxes into your organization, some solutions may require the use of Exchange 2010 servers.

If you decide that you need to deploy Exchange 2010 servers, you need to do so before you deploy Exchange 2016. You need to prepare Active Directory for each Exchange version in the following order:

1. Exchange 2010
2. Exchange 2013 (only required if you're planning to deploy Exchange 2013 at a later date)
3. Exchange 2016

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

The computer needs to be restarted before Setup can continue [PendingRebootWindowsComponents]

8/3/2020 • 2 minutes to read • Edit Online

Exchange Setup can't continue because it detected a pending reboot to complete the installation of other programs or Windows updates.

Why is this happening?

When programs and Windows updates are installed, they make changes to files that are stored on your computer. Some programs or updates need to modify or replace files that are currently in use. When this happens, you need to restart the computer before other programs can be installed.

If the installation of a previous program or Windows update didn't complete successfully, Windows and other programs might think a restart is required. You'll continue to see this error each time you run Exchange Setup if this happens (the failed installation can't fix the condition that indicates a restart is required).

How do I fix it?

Typically, you only need to restart the server to get past this error, but you might get this error again after a restart (for example, additional program or Windows updates also require a restart). Try restarting the server again.

If you see this error after you've restarted the server more than two or three times, try reinstalling any programs or Windows updates that you've installed recently. This might allow a failed installation to complete successfully.

If you *still* receive this error after multiple restarts and reinstalling recent programs or Windows updates, we recommend that you contact Microsoft Customer Service and Support. They'll help you find the reason why Windows and other programs think your computer needs to be restarted. To contact Microsoft support, go to Support for business and select **Servers** > **Exchange Server**.

Caution

Although it's tempting, we strongly recommend that you don't attempt to work around this issue by manually deleting or changing registry keys or values. Although you might fix this issue now, manually modifying the registry might cause issues later on. This is especially important if the failed installation was a Windows update.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

Can't install Exchange 2016 in a forest that contains Exchange 2000 or Exchange 2003 servers. [Exchange2000or2003PresentInOrg]

8/3/2020 • 2 minutes to read • Edit Online

Exchange Setup can't continue because a version of Exchange that's too old for coexistence with the version that you're installing was found in the Active Directory forest. Before you can continue, you need to eliminate all unsupported versions of Exchange from your forest, which might require that you to upgrade to an interim version of Exchange first.

The installation of Exchange Server 2016 or later can't continue because Setup found one or more Exchange 2000 or Exchange 2003 servers in the Active Directory forest. Before you can install Exchange 2016 or later in your organization, you need to remove all Exchange 2000 or Exchange 2003 servers from the forest.

The upgrade path that you need to follow depends on your current version of Exchange. The upgrade paths are described in the following table:

> **NOTE**
>
> When you need to upgrade to an interim version of Exchange, you need to migrate all mailboxes, public folders and other components onto the interim version of Exchange before you decommission and remove the earlier Exchange servers.

CURRENT EXCHANGE VERSION	LATEST EXCHANGE VERSION FOR COEXISTENCE	UPGRADE PATH SUMMARY
Exchange 2000	Exchange 2007	Exchange 2000 > Exchange 2007 > Exchange 2013 > Exchange 2019.
Exchange 2003	Exchange 2010	Exchange 2003 > Exchange 2010 > Exchange 2016 > Exchange 2019.
Exchange 2007	Exchange 2013	Exchange 2007 > Exchange 2013 > Exchange 2019.
Exchange 2010	Exchange 2016	Exchange 2010 > Exchange 2016 > Exchange 2019.

CURRENT EXCHANGE VERSION	LATEST EXCHANGE VERSION FOR COEXISTENCE	UPGRADE PATH SUMMARY
Exchange 2000	Exchange 2007	Exchange 2000 > Exchange 2007 > Exchange 2013 > Exchange 2016.
Exchange 2003	Exchange 2010	Exchange 2003 > Exchange 2010 > Exchange 2016.
Exchange 2007	Exchange 2013	Exchange 2007 > Exchange 2013 > Exchange 2016.

CURRENT EXCHANGE VERSION	LATEST EXCHANGE VERSION FOR COEXISTENCE	UPGRADE PATH SUMMARY
Exchange 2010	Exchange 2016	Exchange 2010 > Exchange 2016.

When upgrading to Exchange 2013 or later, you can use the Exchange Deployment Assistant to help complete your deployment. For more information, see Exchange Deployment Assistant.

An incompatible operating system was found [ValidOSVersion]

8/3/2020 • 2 minutes to read • Edit Online

Microsoft Exchange Server 2016 Setup can't continue because it detected an incompatible operating system. You must install a compatible operating system on this computer before you install Exchange 2016. The following table shows the operating systems that are compatible with Exchange 2016.

IMPORTANT

Exchange 2016 doesn't support the Server Core installation option of Windows Server.

Supported operating systems for Exchange 2016

COMPONENT	REQUIREMENT
Mailbox and Edge Transport server roles	Windows Server 2016 Standard or Datacenter* Windows Server 2012 R2 Standard or Datacenter Windows Server 2012 Standard or Datacenter
Management tools	One of the following: • Windows Server 2016 Standard or Datacenter* • Windows Server 2012 R2 Standard or Datacenter • Windows Server 2012 Standard or Datacenter • 64-bit edition of Windows 10 • 64-bit edition of Windows 8.1

* Requires Exchange Server 2016 Cumulative Update 3 or later.

For more information, see Exchange Server system requirements.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

ExecutionPolicy GPO is defined [PowerShellExecutionPolicyCheckSet]

8/3/2020 • 2 minutes to read • Edit Online

Exchange Setup can't continue because it detected that the **ExecutionPolicy** Group Policy Object (GPO) defines one or both of the following policies:

- **MachinePolicy**
- **UserPolicy**

It doesn't matter how the policies have been defined; it only matters that they have been defined.

Exchange Setup stops and disables the Windows Management Instrumentation (WMI) service. When either of these policies are defined, the WMI service needs to be enabled to run a Windows PowerShell script. If the policies are defined and the WMI service is stopped, Setup will fail and the server will be left in an inconsistent state.

To allow Setup to continue, you need to temporarily remove any definition of **MachinePolicy** or **UserPolicy** in the **ExecutionPolicy** GPO:

```
Set-ItemProperty -Path HKLM:\SOFTWARE\Policies\Microsoft\Windows\PowerShell -Name ExecutionPolicy –Value ""
```

Having problems? Ask for help in the Exchange forums.

Primary DNS Suffix is missing [ms.exch.setupreadiness.FqdnMissing]

8/3/2020 • 2 minutes to read • Edit Online

Exchange Setup can't continue because the primary DNS suffix (for example, contoso.com) hasn't been configured on the target server. Typically, you'll encounter this error when you're trying to install the Edge Transport server role.

To resolve this issue, add a primary DNS suffix on the computer and then run Setup again.

1. Replace <Value> with the DNS suffix you want to use (for example, contoso.com), and run the following command in Winows Powershell on the target server:

```
Set-ItemProperty -Path HKLM:\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters -Name 'NV Domain' -Value
<Value>
```

2. Restart the computer and run Setup again.

> **IMPORTANT**
>
> Changing the computer name or primary DNS suffix after you install Exchange isn't supported.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

MAPI over HTTP isn't enabled [WarnMapiHttpNotEnabled]

8/3/2020 • 2 minutes to read • Edit Online

Microsoft Exchange Server 2016 Setup displayed this warning because there are servers running Exchange 2016 or later in this organization and MAPI over HTTP isn't enabled.

MAPI over HTTP is the preferred Outlook connectivity method when connecting to servers running Exchange 2016 or later. MAPI over HTTP improves the reliability and stability of the Outlook and Exchange connections by moving the transport layer to the industry-standard HTTP model. This allows a higher level of visibility of transport errors and enhanced recoverability. Additional functionality includes support for an explicit pause-and-resume function. This enables supported clients to change networks or resume from hibernation while maintaining the same server context.

Exchange Setup won't automatically enable MAPI over HTTP to avoid making unexpected changes to client connectivity. However, we recommend that you enable MAPI over HTTP as soon as possible to receive the benefits it provides.

For more information about MAPI over HTTP and how to enable it, see MAPI over HTTP in Exchange Server.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

Can't install Exchange 2016 or later in a forest that contains Exchange 2007 [E16E12CoexistenceMinVersionRequirement]

8/3/2020 • 2 minutes to read • Edit Online

The installation of Exchange Server 2016 or later can't continue because Setup found one or more Exchange 2007 servers in the Active Directory forest. Before you can install Exchange 2016 or later in your organization, you need to remove all Exchange 2007 servers from the forest.

The upgrade steps from Exchange 2007 are:

1. Install Exchange 2013 into your Exchange 2007 organization.
2. Configure Exchange 2013 and Exchange 2007 coexistence.
3. Migrate Exchange 2007 mailboxes, public folders, and other components to Exchange 2013.
4. Decommission and remove all Exchange 2007 servers.
5. Install Exchange 2016 or Exchange 2019 into your Exchange 2013 organization.
6. Configure coexistence with Exchange 2013.
7. Migrate Exchange 2013 mailboxes, public folders, and other components to Exchange 2016 or Exchange 2019.
8. Decommission and remove all Exchange 2013 servers.

The coexistence (and therefore, upgrade) options for Exchange are described in the following table:

CURRENT EXCHANGE VERSION	LATEST EXCHANGE VERSION FOR COEXISTENCE
Exchange 2000	Exchange 2007
Exchange 2003	Exchange 2010
Exchange 2007	Exchange 2013
Exchange 2010	Exchange 2016
Exchange 2013	Exchange 2019

When upgrading to Exchange 2013 or later, you can use the Exchange Deployment Assistant to help complete your deployment. For more information, see Exchange Deployment Assistant.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

Exchange 2010 SP3 RU11 or later is required for coexistence with Exchange 2016 [E16E14CoexistenceMinVersionRequirement]

8/3/2020 • 2 minutes to read • Edit Online

The installation of Exchange Server 2016 can't continue because Setup found one or more Exchange 2010 servers that aren't running the minimum required version of Exchange 2010. Before you can install Exchange 2016 in your organization, all Exchange 2010 servers in the forest need to be running Exchange 2010 Service Pack 3 (SP3) and Update Rollup 11 (RU11) or later. This requirement includes Exchange 2010 Edge Transport servers.

> **IMPORTANT**
>
> After you upgrade your Exchange 2010 Edge Transport servers to Exchange 2010 SP3 RU11 or later, you need to **re-create** the Edge subscription between your Exchange organization and each Edge Transport server (to update the Edge Transport server's Exchange version in Active Directory). For more information about re-creating Edge subscriptions in Exchange 2010, see Managing Edge Subscriptions.

Exchange 2013 CU10 or later is required for coexistence with Exchange 2016 or later [E16E15CoexistenceMinVersionRequirement]

8/3/2020 • 2 minutes to read • Edit Online

The installation of Exchange Server 2016 or later can't continue because Setup found one or more Exchange 2013 servers that aren't running the minimum required version of Exchange 2013. Before you can install Exchange 2016 or later in your organization, all Exchange 2013 servers in the forest need to be running Exchange 2013 Cumulative Update 10 (CU10) or later. This requirement includes Exchange 2013 Edge Transport servers.

> **IMPORTANT**
>
> After you upgrade your Exchange 2013 Edge Transport servers to Exchange 2013 CU10 or later, you need to **`re-create`** the Edge subscription between your Exchange organization and each Edge Transport server (to update the Edge Transport server's Exchange version in Active Directory). For more information about re-creating Edge subscriptions in Exchange 2013, see Manage Edge Subscriptions.

No Exchange 2013 servers detected [NoE15ServerWarning]

8/3/2020 • 2 minutes to read • Edit Online

Microsoft Exchange Server 2016 Setup displayed this warning because no Exchange Server 2013 server roles exist in the organization.

Caution

If you continue with Exchange Server 2016 installation, you won't be able to add Exchange 2013 servers to the organization at a future date.

Before deploying Exchange 2016, consider the following factors that may require you to deploy Exchange 2013 servers prior to deploying Exchange 2016:

- **Third-party or in-house developed applications**: Applications developed for earlier versions of Exchange may not be compatible with Exchange 2016. You may need to maintain Exchange 2013 servers to support these applications.

- **Coexistence or migration requirements**: If you plan on migrating mailboxes into your organization, some solutions may require the use of Exchange 2013 servers.

If you decide that you need to deploy Exchange 2013 servers, you must do so before you deploy Exchange 2016. Active Directory must be prepared for each Exchange version in the following order:

1. Exchange 2013

2. Exchange 2016

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Running "dir" on an ReFS-formatted disk could cause the computer to freeze [Win2k12RefsUpdateNotInstalled]

8/3/2020 • 2 minutes to read • Edit Online

Microsoft Exchange Server 2016 Setup has detected that the computer you're attempting to install Exchange 2016 on doesn't have a recommended Windows update installed. We strongly recommend that you install this Windows update before installing Exchange 2016 to avoid any issues resolved by the update.

Computers running Windows Server 2012 and later support the Resilient File System (ReFS). An issue exists that could cause computers to freeze when the "**dir**" command is run on disks formatted with ReFS.

Download and install the 64-bit update from the following URL, and then click **retry** on the **Readiness Checks** page.

> **NOTE**
>
> If this update requires a reboot to complete installation, you'll need to exit Exchange 2016 Setup, reboot, and then start Setup again.

Microsoft Knowledge Base article KB2894875, Windows 8-based or Windows Server 2012-based computer freezes when you run the "dir" command on an ReFS volume.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

A Windows Server 2012 update rollup hasn't been installed [Win2k12RollupUpdateNotInstalled]

8/3/2020 • 2 minutes to read • Edit Online

Microsoft Exchange Server 2016 Setup has detected that the computer you're attempting to install Exchange 2016 on doesn't have a recommended Windows update installed. We strongly recommend that you install this Windows update before installing Exchange 2016 to avoid any issues resolved by the update.

A Windows Server 2012 update rollup that resolves several issues, including those that could cause Resilient File System (ReFS)-formatted disks to perform unreliably, hasn't been installed.

Download and install the 64-bit update from the following URL, and then click **retry** on the **Readiness Checks** page.

> **NOTE**
>
> If this update requires a reboot to complete installation, you'll need to exit Exchange 2016 Setup, reboot, and then start Setup again.

Microsoft Knowledge Base article KB2822241, Windows 8 and Windows Server 2012 update rollup: April 2013.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

Disks formatted as ReFS may not perform reliably [Win2k12UrefsUpdateNotInstalled]

8/3/2020 • 2 minutes to read • Edit Online

Microsoft Exchange Server 2016 Setup has detected that the computer you're attempting to install Exchange 2016 on doesn't have a recommended Windows update installed. We strongly recommend that you install this Windows update before installing Exchange 2016 to avoid any issues resolved by the update.

Computers running Windows Server 2012 and later support the Resilient File System (ReFS). An issue in the Virtual Disk Service could cause disks formatted as ReFS to not perform reliably. This could result in data corruption or data loss.

Download and install the 64-bit update from the following URL, and then click **retry** on the **Readiness Checks** page.

> **NOTE**
>
> If this update requires a reboot to complete installation, you'll need to exit Exchange 2016 Setup, reboot, and then start Setup again.

Microsoft Knowledge Base article KB2884597, Virtual Disk Service or applications that use the Virtual Disk Service crash or freeze in Windows Server 2012.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

KB3206632 security update not installed [Win2k16LSARollupUpdateNotInstalled]

8/3/2020 • 2 minutes to read • Edit Online

Microsoft Exchange Server 2016 Setup can't continue because the local computer requires a software update. You'll need to install this update before Exchange 2016 Setup can continue.

Exchange 2016 Setup requires that the December 13, 2016 (KB3206632) security update be installed on the computer before installation can continue.

Download and install the 64-bit update from the following URL, and then click **retry** on the **Readiness Checks** page.

> **NOTE**
>
> If this update requires a reboot to complete installation, you'll need to exit Exchange 2016 Setup, reboot, and then start Setup again.

December 13, 2016 (KB3206632) security update

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

Windows Server Core or Windows Nano Server is installed [IsServerCoreInstalled]

8/3/2020 • 2 minutes to read • Edit Online

Microsoft Exchange Server 2016 Setup can't continue because it detected that the local computer is running Windows Server Core or Windows Nano Server. Exchange 2016 requires that **Windows Server with Desktop Experience** (Windows Server 2016) or **Windows Server with a GUI** (Windows Server 2012 and 2012R2) is installed on the local computer. Before you can install Exchange 2016, you need to do one of the following depending on the version of Windows Server you have installed:

- **Windows Server 2012 and Windows Server 2012 R2**: Run the following command in Windows PowerShell:

  ```
  Install-WindowsFeature Server-Gui-Mgmt-Infra, Server-Gui-Shell -Restart
  ```

- **Windows Server 2016**: Install Windows Server 2016 and choose the **Desktop Experience** installation option. If a computer is running Windows Server 2016 Core or Nano and you want to install Exchange 2016 on it, you'll need to reinstall the operating system and choose the **Desktop Experience** installation option.

For more information, see Exchange Server system requirements.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Exchange Server editions and versions

8/3/2020 • 2 minutes to read • Edit Online

Exchange Server 2016 and Exchange Server 2019 are available in two server editions:

- **Enterprise Edition**: Can scale up to 100 mounted databases per server.
- **Standard Edition**: Limited to five mounted databases per server.

A *mounted database* is a database that's in use (an active mailbox database that's mounted for use by clients or a passive mailbox database that's mounted in recovery for log replication and replay). While you can create more databases than the described limits, you can only mount the maximum number of databases that are allowed by the edition of Exchange. Note that the recovery database doesn't count towards these limits.

The server editions are defined by a product key. When you enter a valid product key, the supported edition for the server is established. For more information, see Enter your Exchange Server product key.

Notes:

- You can use a valid product key to move from the Trial Edition (evaluation version) of Exchange to either Standard Edition or Enterprise Edition. No loss of functionality occurs after the Trial Edition expires, so you can maintain lab, demo, training, and other non-production environments beyond 120 days without having to reinstall the Trial Edition of Exchange or entering a product key.
- You can use a valid product key to move from Standard Edition to Enterprise Edition.
- You can't use a valid product key to downgrade from Enterprise Edition to Standard Edition or revert to the Trial Edition. You can only do these types of downgrades by uninstalling Exchange, reinstalling Exchange, and entering the correct product key.

Exchange Server versions

For a list of Exchange Server versions and how to download and upgrade to the latest version of Exchange, see the following topics:

- Exchange Server build numbers and release dates
- Install Exchange Mailbox servers using the Setup wizard
- Upgrade Exchange to the latest Cumulative Update

To view the Exchange version and edition information for all Exchange servers in your organization, run the following command in the Exchange Management Shell:

```
Get-ExchangeServer | Format-Table -Auto Name,Edition,AdminDisplayVersion
```

Exchange Server license types

Exchange 2013 and all later versions use a licensing model that's similar to how Exchange 2010 was licensed:

- **Server licenses**: A license must be assigned for each Exchange server. The Server license is sold in two server editions: Standard Edition and Enterprise Edition.
- **Client Access licenses (CALs)**: Exchange also comes in two CAL editions, which are referred to as a

Standard CAL and an Enterprise CAL. You can mix and match the Exchange server editions with the CAL types. For example, you can use Enterprise CALs with Standard Edition or Standard CALs with Enterprise Edition.

For more information about Exchange license types, see Exchange Licensing FAQs.

Exchange Server language support

8/3/2020 • 2 minutes to read • Edit Online

Exchange Server 2016 and Exchange Server 2019 have enhanced language support for both servers and clients. This topic lists the languages that are available for both servers and clients in Exchange 2016 and Exchange 2019.

Supported server languages for Exchange 2016 and Exchange 2019

- Chinese (Simplified)
- Chinese (Traditional)
- English
- French
- German
- Italian
- Japanese
- Korean
- Portuguese
- Russian
- Spanish

Supported client languages for Exchange 2016 and Exchange 2019

- Amharic
- Arabic
- Basque (Basque)
- Bengali (India)
- Bulgarian
- Catalan
- Chinese (Simplified)
- Chinese (Traditional)
- Croatian
- Czech
- Danish
- Dutch
- English
- Estonian

- Filipino (Philippines)
- Finnish
- French
- Galician
- German
- Greek
- Gujarati
- Hebrew
- Hindi
- Hungarian
- Icelandic
- Indonesian
- Italian
- Japanese
- Kannada
- Kazakh
- Kiswahili
- Korean
- Latvian
- Lithuanian
- Malay (Brunei Darussalam)
- Malay (Malaysia)
- Malayalam
- Marathi
- Norwegian (Bokmål)
- Norwegian (Nynorsk)
- Oriya
- Persian
- Polish
- Portuguese (Brazil)
- Portuguese (Portugal)
- Romanian
- Russian

- Serbian (Cyrillic, Serbia)
- Serbian (Latin)
- Slovak
- Slovenian
- Spanish
- Swedish
- Tamil
- Telugu
- Thai
- Turkish
- Ukrainian
- Urdu
- Vietnamese
- Welsh

Exchange Server storage configuration options

8/3/2020 • 21 minutes to read • Edit Online

Understanding the storage options and requirements for Mailbox servers in Exchange Server 2016 and Exchange Server 2019 is an important part of your Mailbox server storage design solution.

Storage architectures

The following table describes supported storage architectures and provides best practice guidance for each type of storage architecture where appropriate.

Supported storage architectures

STORAGE ARCHITECTURE	DESCRIPTION	BEST PRACTICE
Direct-attached storage (DAS)	DAS is a digital storage system directly attached to a server or workstation, without a storage network in between. For example, DAS transports include Serial Attached Small Computer System Interface (SCSI) and Serial Attached Advanced Technology Attachment (ATA).	Not available.
Storage area network (SAN): Internet Small Computer System Interface (iSCSI)	SAN is an architecture to attach remote computer storage devices (such as disk arrays and tape libraries) to servers in such a way that the devices appear as locally attached to the operating system (for example, block storage). iSCSI SANs encapsulate SCSI commands within IP packets and use standard networking infrastructure as the storage transport (for example, Ethernet).	Don't share physical disks backing up Exchange data with other applications. Use dedicated storage networks. Use multiple network paths for stand-alone configurations.
SAN: Fibre Channel	Fibre Channel SANs encapsulate SCSI commands within Fibre Channel packets and generally utilize specialized Fibre Channel networks as the storage transport.	Don't share physical disks backing up Exchange data with other applications. Use multiple Fibre Channel network paths for stand-alone configurations. Follow storage vendor's best practices for tuning Fibre Channel host bus adapters (HBAs), for example, Queue Depth and Queue Target.

A network-attached storage (NAS) unit is a self-contained computer connected to a network, with the sole purpose of supplying file-based data storage services to other devices on the network. The operating system and other software on the NAS unit provide the functionality of data storage, file systems, and access to files, and the management of these functions (for example, file storage).

All storage used by Exchange for storage of Exchange data must be block-level storage because Exchange 2016 doesn't support the use of NAS volumes, other than in the SMB 3.0 scenario outlined in the topic Exchange Server virtualization. Also, in a virtualized environment, NAS storage that's presented to the guest as block-level storage via the hypervisor isn't supported.

Using storage tiers is not recommended, as it could adversely affect system performance. For this reason, do not allow the storage controller to automatically move the most accessed files to "faster" storage.

Physical disk types

The following table provides a list of supported physical disk types and provides best practice guidance for each physical disk type where appropriate.

Supported physical disk types

PHYSICAL DISK TYPE	DESCRIPTION	SUPPORTED OR BEST PRACTICE
Serial ATA (SATA)	SATA is a serial interface for ATA and integrated device electronics (IDE) disks. SATA disks are available in a variety of form factors, speeds, and capacities. In general, choose SATA disks for Exchange 2016 mailbox storage when you have the following design requirements: • High capacity • Moderate performance • Moderate power utilization	Supported: 512-byte sector disks for Windows Server 2008 and Windows Server 2008 R2. In addition, 512e disks are supported for Windows Server 2008 R2 with the following: • The hotfix described in KB982018. • Windows Server 2008 R2 with Service Pack 1 (SP1) and Exchange Server 2010 SP1. Exchange 2013 and later supports native 4-kilobyte (KB) sector disks and 512e disks. Support requires that all copies of a database reside on the same physical disk type. For example, it is not a supported configuration to host one copy of a given database on a 512-byte sector disk and another copy of that same database on a 512e disk or 4K disk. Best practice: Consider enterprise class SATA disks, which generally have better heat, vibration, and reliability characteristics.
Serial Attached SCSI	Serial Attached SCSI is a serial interface for SCSI disks. Serial Attached SCSI disks are available in a variety of form factors, speeds, and capacities. In general, choose Serial Attached SCSI disks for Exchange 2016 mailbox storage when you have the following design requirements: • Moderate capacity • High performance • Moderate power utilization	Supported: 512-byte sector disks for Windows Server 2008 and Windows Server 2008 R2. In addition, 512e disks are supported for Windows Server 2008 R2 with the following: • The hotfix described in KB982018. • Windows Server 2008 R2 SP1 and Exchange Server 2010 SP1. Exchange 2013 and later supports native 4-kilobyte (KB) sector disks and 512e disks. Support requires that all copies of a database reside on the same physical disk type. For example, it is not a supported configuration to host one copy of a given database on a 512-byte sector disk and another copy of that same database on a 512e disk or 4K disk. Best practice: Physical disk-write caching must be disabled when used without a UPS.

PHYSICAL DISK TYPE	DESCRIPTION	SUPPORTED OR BEST PRACTICE
Fibre Channel	Fibre Channel is an electrical interface used to connect disks to Fibre Channel-based SANs. Fibre Channel disks are available in a variety of speeds and capacities. In general, choose Fibre Channel disks for Exchange 2016 mailbox storage when you have the following design requirements: • Moderate capacity • High performance • SAN connectivity	Supported: 512-byte sector disks for Windows Server 2008 and Windows Server 2008 R2. In addition, 512e disks are supported for Windows Server 2008 R2 with the following: • The hotfix described in KB982018. • Windows Server 2008 R2 with Service Pack 1 (SP1) and Exchange Server 2010 SP1. Exchange 2013 and later supports native 4-kilobyte (KB) sector disks and 512e disks. Support requires that all copies of a database reside on the same physical disk type. For example, it is not a supported configuration to host one copy of a given database on a 512-byte sector disk and another copy of that same database on a 512e disk or 4K disk. Best practice: Physical disk-write caching must be disabled when used without a UPS.
Solid-state drive (SSD) (flash disk)	An SSD is a data storage device that uses solid-state memory to store persistent data. An SSD emulates a hard disk drive interface. SSD disks are available in a variety of speeds (different I/O performance capabilities) and capacities. In general, choose SSD disks for Exchange 2016 mailbox storage when you have the following design requirements: • Low capacity • Extremely high performance	Supported: 512-byte sector disks for Windows Server 2008 and Windows Server 2008 R2. In addition, 512e disks are supported for Windows Server 2008 R2 with the following: • The hotfix described in KB982018. • Windows Server 2008 R2 SP1 and Exchange Server 2010 SP1. Exchange 2013 and later supports native 4-kilobyte (KB) sector disks and 512e disks when all copies of a database reside on the same physical disk type. For example, it is not a supported configuration to host one copy of a given database on a 512-byte sector disk and another copy of that same database on a 512e disk or 4K disk. Best practice: Physical disk-write caching must be disabled when used without a UPS. In general, Exchange 2016 Mailbox servers don't require the performance characteristics of SSD storage.

Factors to consider when choosing disk types

There are several trade-offs when choosing disk types for Exchange 2016 storage. The correct disk is one that balances performance (both sequential and random) with capacity, reliability, power utilization, and capital cost. The following table of supported physical disk types provides information to help you when considering these factors.

From a performance perspective, using large, slower disks for Exchange storage is okay, provided the disks can maintain an average read and write latency of 20ms or less under load.

Factors in disk type choice

DISK SPEED (RPM)	DISK FORM FACTOR	INTERFACE OR TRANSPORT	CAPACITY	RANDOM I/O PERFORMANCE	SEQUENTIAL I/O PERFORMANCE	POWER UTILIZATION
5,400	2.5-inch	SATA	Average	Poor	Poor	Excellent
5,400	3.5-inch	SATA	Excellent	Poor	Poor	Above average
7,200	2.5-inch	SATA	Average	Average	Average	Excellent
7,200	2.5-inch	Serial Attached SCSI	Average	Average	Above average	Excellent
7,200	3.5-inch	SATA	Excellent	Average	Above average	Above average
7,200	3.5-inch	Serial Attached SCSI	Excellent	Average	Above average	Above average
7,200	3.5-inch	Fibre Channel	Excellent	Average	Above average	Average
10,000	2.5-inch	Serial Attached SCSI	Below average	Excellent	Above average	Above average
10,000	3.5-inch	SATA	Average	Average	Above average	Above average
10,000	3.5-inch	Serial Attached SCSI	Average	Above average	Above average	Below average
10,000	3.5-inch	Fibre Channel	Average	Above average	Above average	Below average
15,000	2.5-inch	Serial Attached SCSI	Poor	Excellent	Excellent	Average
15,000	3.5-inch	Serial Attached SCSI	Average	Excellent	Excellent	Below average
15,000	3.5-inch	Fibre Channel	Average	Excellent	Excellent	Poor
SSD: enterprise class	Not applicable	SATA, Serial Attached SCSI, Fibre Channel	Poor	Excellent	Excellent	Excellent

Best practices for supported storage configurations

This section provides best practice information about supported disk and array controller configurations. In addition to the commonly used Redundant Array of Indepentdent Disks (RAID), there is also just a bunch of disks (or drives), or JBOD, which refers to a collection of hard disks that have not been configured to act as a redundant array.

RAID is often used to both improve the performance characteristics of individual disks (by striping data across several disks) as well as to provide protection from individual disk failures. With the advancements in Exchange 2016 high availability, RAID is not a required component for Exchange 2016 storage design. However, RAID is still an essential component of Exchange 2016 storage design for standalone servers as well as solutions that require storage fault tolerance.

Operating System, System, or Pagefile Volume

The recommended configuration for an operating system, system or pagefile volume is to utilize RAID technology to protect this data type. The recommended RAID configuration is either RAID-1 or RAID-1/0, however all RAID types are supported.

Separated Mailbox Database and Log Volumes

If you're deploying a standalone Mailbox server role architecture, RAID technology is required for the mailbox database and log volumes. The recommended RAID configuration for mailbox volumes is RAID-1/0 (especially if you're using 5.4K or 7.2K disks); however all RAID types are supported. For log volumes, RAID-1 or RAID-1/0 is the recommended RAID configuration.

When using RAID-5 or RAID-6 configurations for the operating system, pagefile, or Exchange data volumes, note the following:

- RAID-5 configurations, including variations such as RAID-50 and RAID-51, should have no more than 7 disks per array group and array controller high-priority scrubbing and surface scanning enabled.
- RAID-6 configurations should have array controller high-priority scrubbing and surface scanning enabled.

Although JBOD is supported in high availability architectures that have 3 or more highly available database copies, because the log and mailbox database volumes are separated, JBOD is not recommended as a solution.

Mailbox Database and Log Volume Co-Location

Mailbox database and log volume co-location is not recommended in standalone architectures. In high availability architectures, there are two possibilities for this scenario:

1. Single database per volume
2. Multiple databases per volume

Single Database Per Volume

In an Exchange environment, a JBOD storage solution involves having both the database and its associated logs stored on a single disk. To deploy a JBOD solution, you must deploy a minimum of three highly available database copies. Utilizing a single disk is a single point of failure, because when the disk fails, the database copy residing on that disk is lost. Having a minimum of three database copies ensures fault tolerance by having two additional copies in the event that one copy (or one disk) fails. However, placement of three highly available database copies, as well as the use of lagged database copies, can affect storage design. The following table shows guidelines for RAID or JBOD considerations.

RAID or JBOD Considerations

DATACENTER SERVERS	TWO HIGHLY AVAILABLE COPIES (TOTAL)	THREE HIGHLY AVAILABLE COPIES (TOTAL)	TWO OR MORE HIGHLY AVAILABLE COPIES PER DATACENTER	ONE LAGGED COPY	TWO OR MORE LAGGED COPIES PER DATACENTER
Primary datacenter servers	RAID	RAID or JBOD (2 copies)	RAID or JBOD	RAID	RAID or JBOD

DATACENTER SERVERS	TWO HIGHLY AVAILABLE COPIES (TOTAL)	THREE HIGHLY AVAILABLE COPIES (TOTAL)	TWO OR MORE HIGHLY AVAILABLE COPIES PER DATACENTER	ONE LAGGED COPY	TWO OR MORE LAGGED COPIES PER DATACENTER
Secondary datacenter servers	RAID	RAID (1 copy)	RAID or JBOD	RAID	RAID or JBOD

To deploy on JBOD with the primary datacenter servers, you need three or more highly available database copies within the DAG. If mixing lagged copies on the same server hosting highly available database copies (for example, not using dedicated lagged database copy servers), you need at least two lagged database copies.

For the secondary datacenter servers to use JBOD, you should have at least two highly available database copies in the secondary datacenter. The loss of a copy in the secondary datacenter won't result in requiring a reseed across the WAN or having a single point of failure in the event the secondary datacenter is activated. If mixing lagged database copies on the same server hosting highly available database copies (for example, not using dedicated lagged database copy servers), you need at least two lagged database copies.

For dedicated lagged database copy servers, you should have at least two lagged database copies within a datacenter to use JBOD. Otherwise, the loss of disk results in the loss of the lagged database copy, as well as the loss of the protection mechanism.

Multiple Databases Per Volume

Multiple databases per volume is a new JBOD scenario available in Exchange 2016 that allows for active and passive copies (including lagged copies) to be mixed on a single disk, enabling better disk utilization. However, to deploy lagged copies in this manner, automatic lagged copy log file play down must be enabled. The following table shows guidelines for JBOD considerations for multiple databases per volume.

JBOD Considerations

DATACENTER SERVERS	3 OR MORE COPIES (TOTAL)	TWO OR MORE COPIES PER DATACENTER
Primary datacenter servers	JBOD	JBOD
Secondary datacenter servers	N/A	JBOD

The following table provides guidance about storage array configurations for Exchange 2016.

Supported RAID types for the Exchange 2016 Mailbox server role

RAID TYPE	DESCRIPTION	SUPPORTED OR BEST PRACTICE
Disk array RAID stripe size (KB)	The stripe size is the per disk unit of data distribution within a RAID set. Stripe size is also referred to as *block size*.	Best practice: 256 KB or greater. Follow storage vendor best practices.

RAID TYPE	DESCRIPTION	SUPPORTED OR BEST PRACTICE
Storage array cache settings	The cache settings are provided by a battery-backed caching array controller.	Best practice: 100 percent write cache (battery or flash backed cache) for DAS storage controllers in either a RAID or JBOD configuration. 75 percent write cache, 25 percent read cache (battery or flash backed cache) for other types of storage solutions such as SAN. If your SAN vendor has different best practices for cache configuration on their platform, follow the guidance of your SAN vendor.
Physical disk write caching	The settings for the cache are on each individual disk.	Supported: Physical disk write caching must be disabled when used without a UPS.

The following table provides guidance about database and log file choices.

Database and log file choices for the Exchange 2016 Mailbox server role

DATABASE AND LOG FILE OPTIONS	DESCRIPTION	STAND-ALONE: SUPPORTED OR BEST PRACTICE	HIGH AVAILABILITY: SUPPORTED OR BEST PRACTICE
File placement: database per log isolation	Database per log isolation refers to placing the database file and logs from the same mailbox database onto different volumes backed by different physical disks.	Best practice: For recoverability, move database (.edb) file and logs from the same database to different volumes backed by different physical disks.	Supported: Isolation of logs and databases isn't required.
File placement: database files per volume	Database files per volume refers to how you distribute database files within or across disk volumes.	Best practice: Based on your backup methodology.	Supported: When using JBOD, create a single volume with separate directories for database(s) and for log files.
File placement: log streams per volume	Log streams per volume refers to how you distribute database log files within or across disk volumes.	Best practice: Based on your backup methodology.	Supported: When using JBOD, create a single volume with separate directories for database(s) and for log files. Best practice: When using JBOD, leverage multiple databases per volume.
Database size	Database size refers to the disk database (.edb) file size.	Supported: Approximately 16 terabytes. Best practice: • 200 gigabytes (GB) or less. • Provision for 120 percent of calculated maximum database size.	Supported: Approximately 16 terabytes. Best practice: • 2 terabytes or less. • Provision for 120 percent of calculated maximum database size.

DATABASE AND LOG FILE OPTIONS	DESCRIPTION	STAND-ALONE: SUPPORTED OR BEST PRACTICE	HIGH AVAILABILITY: SUPPORTED OR BEST PRACTICE
Log truncation method	Log truncation method is the process for truncating and deleting old database log files. There are two mechanisms: • Circular logging, in which Exchange deletes the logs. • Log truncation, which occurs after a successful full or incremental Volume Shadow Copy Service (VSS) backup.	Best practice: • Use backups for log truncation (for example, circular logging disabled). • Provision for three days of log generation capacity.	Best practice: • Enable circular logging for deployments that use Exchange native data protection features. • Provision for three days beyond replay lag setting of log generation capacity.

The following table provides guidance about Windows disk types.

Windows disk types for the Exchange 2016 Mailbox server role

WINDOWS DISK TYPE	DESCRIPTION	STAND-ALONE: SUPPORTED OR BEST PRACTICE	HIGH AVAILABILITY: SUPPORTED OR BEST PRACTICE
Basic disk	A disk initialized for basic storage is called a basic disk. A basic disk contains basic volumes, such as primary partitions, extended partitions, and logical drives.	Supported. Best practice: Use basic disks.	Supported. Best practice: Use basic disks.
Dynamic disk	A disk initialized for dynamic storage is called a dynamic disk. A dynamic disk contains dynamic volumes, such as simple volumes, spanned volumes, striped volumes, mirrored volumes, and RAID-5 volumes.	Supported.	Supported.

The following table provides guidance on volume configurations.

Volume configurations for the Exchange 2016 Mailbox server role

VOLUME CONFIGURATION	DESCRIPTION	STAND-ALONE: SUPPORTED OR BEST PRACTICE	HIGH AVAILABILITY: SUPPORTED OR BEST PRACTICE
GUID partition table (GPT)	GPT is a disk architecture that expands on the older master boot record (MBR) partitioning scheme. The maximum NTFS formatted partition size is 256 terabytes.	Supported. Best practice: Use GPT partitions.	Supported. Best practice: Use GPT partitions.

VOLUME CONFIGURATION	DESCRIPTION	STAND-ALONE: SUPPORTED OR BEST PRACTICE	HIGH AVAILABILITY: SUPPORTED OR BEST PRACTICE
MBR	An MBR, or partition sector, is the 512-byte boot sector that is the first sector (LBA Sector 0) of a partitioned data storage device such as a hard disk. The maximum NTFS formatted partition size is 2 terabytes.	Supported.	Supported.
Partition alignment	Partition alignment refers to aligning partitions on sector boundaries for optimal performance.	Supported: The Windows Server 2008 R2 and Windows Server 2012 default is 1 megabyte (MB).	Supported: The Windows Server 2008 R2 and Windows Server 2012 default is 1 MB.
Volume path	Volume path refers to how a volume is accessed.	Supported: Drive letter or mount point.Best practice: Mount point host volume must be RAID enabled.	Supported: Drive letter or mount point. Best practice: Mount point host volume must be RAID-enabled.
File system	File system is a method for storing and organizing computer files and the data they contain to make it easy to find and access the files.	Supported: NTFS and ReFS.	Supported: NTFS and ReFS.
NTFS defragmentation	NTFS defragmentation is a process that reduces the amount of fragmentation in Windows file systems. It does this by physically organizing the contents of the disk to store the pieces of each file close together and contiguously.	Supported. Best practice: Not required and not recommended. On Windows Server 2012, we also recommend disabling the automatic disk optimization and defragmentation feature.	Supported. Best practice: Not required and not recommended. On Windows Server 2012, we also recommend disabling the automatic disk optimization and defragmentation feature.
NTFS allocation unit size	NTFS allocation unit size represents the smallest amount of disk space that can be allocated to hold a file.	Supported: All allocation unit sizes. Best practice: 64 KB for both .edb and log file volumes.	Supported: All allocation unit sizes. Best practice: 64 KB for both .edb and log file volumes.
NTFS compression	NTFS compression is the process of reducing the actual size of a file stored on the hard disk.	Supported: Not supported for Exchange database or log files.	Supported: Not supported for Exchange database or log files.

VOLUME CONFIGURATION	DESCRIPTION	STAND-ALONE: SUPPORTED OR BEST PRACTICE	HIGH AVAILABILITY: SUPPORTED OR BEST PRACTICE
NTFS Encrypting File System (EFS)	EFS enables users to encrypt individual files, folders, or entire data drives. Because EFS provides strong encryption through industry-standard algorithms and public key cryptography, encrypted files are confidential even if an attacker bypasses system security.	Supported: Not supported for Exchange database or log files.	Not supported for Exchange database or log files.
Windows BitLocker (volume encryption)	Windows BitLocker is a data protection feature in Windows Server 2008. BitLocker protects against data theft or exposure on computers that are lost or stolen, and it offers more secure data deletion when computers are decommissioned.	Supported: All Exchange database and log files.	Supported: All Exchange database and log files. Windows failover clusters require Windows Server 2008 R2 or Windows Server 2008 R2 SP1. Exchange volumes with Bitlocker enabled are not supported on Windows failover clusters running earlier versions of Windows. For more information about Windows 7 BitLocker encryption, see BitLocker Drive Encryption in Windows 7: Frequently Asked Questions.
Server Message Block (SMB) 3.0	The Server Message Block (SMB) protocol is a network file sharing protocol (on top of TCP/IP or other network protocols) that allows applications on a computer to access files and resources on a remote server. It also allows applications to communicate with any server program that is set up to receive an SMB client request. Windows Server 2012 introduces the new 3.0 version of the SMB protocol with the following features: • SMB Transparent failover • SMB Scaleout • SMB Multichannel • SMB Direct • SMB Encryption • VSS for SMB file shares • SMB Directory Leasing • SMB PowerShell	Limited Support. Supported scenario is a hardware virtualized deployment where the disks are hosted on VHDs on an SMB 3.0 share. These VHDs are presented to the host via a hypervisor. For more information, see Exchange Server virtualization.	Limited Support. Supported scenario is a hardware virtualized deployment where the disks are hosted on VHDs on an SMB 3.0 share. These VHDs are presented to the host via a hypervisor. For more information, see Exchange Server virtualization.

VOLUME CONFIGURATION	DESCRIPTION	STAND-ALONE: SUPPORTED OR BEST PRACTICE	HIGH AVAILABILITY: SUPPORTED OR BEST PRACTICE
Storage Spaces	Storage Spaces is a new storage solution that delivers virtualization capabilities for Windows Server 2012. Storage Spaces allow you to organize physical disks into storage pools, which can be easily expanded by simply adding disks. These disks can be connected either through USB, SATA or SAS. It also utilizes virtual disks (spaces), which behave just like physical disks, with associated powerful capabilities such as thin provisioning, as well as resiliency to failures of underlying physical media. For more information on Storage Spaces, see Storage Spaces Overview.	Supported. Same restrictions as for physical disk types outlined in this topic.	Supported. Same restrictions as for physical disk types outlined in this topic.
Resilient File System (ReFS)	ReFS is a newly engineered file system for Windows Server 2012 that is built on the foundations of NTFS. ReFS maintains high degree of compatibility with NTFS while providing enhanced data verification and auto-correction techniques as well as an integrated end-to-end resiliency to corruptions especially when used in conjunction with the storage spaces feature. For more information on ReFS, see Resilient File System (ReFS) overview: Supported Deployments.	Supported for volumes containing Exchange database files, log files and content indexing files, provided that the following hotfix is installed: Exchange Server 2013 databases become fragmented in Windows Server 2012. Not supported for volumes containing Exchange binaries. Best practice: Data integrity features must be disabled for the Exchange database (.edb) files or the volume that hosts these files. Integrity features can be enabled for volumes containing the content index catalog, provided that the volume does not contain any databases or log files.	Supported for volumes containing Exchange database files, log files and content indexing files, provided that the following hotfix is installed: Exchange Server 2013 databases become fragmented in Windows Server 2012. Not supported for volumes containing Exchange binaries. Best practice: Data integrity features must be disabled for the Exchange database (.edb) files or the volume that hosts these files. Integrity features can be enabled for volumes containing the content index catalog, provided that the volume does not contain any databases or log files.
ReFS allocation unit size	ReFS allocation unit size represents the smallest amount of disk space that can be allocated to hold a file.	Supported: All allocation unit sizes. Best practice: 64 KB for both .edb and log file volumes.	Supported: All allocation unit sizes. Best practice: 64 KB for both .edb and log file volumes.

VOLUME CONFIGURATION	DESCRIPTION	STAND-ALONE: SUPPORTED OR BEST PRACTICE	HIGH AVAILABILITY: SUPPORTED OR BEST PRACTICE
Data De-Duplication	Data deduplication is a technique to optimize storage utilization. It is a method of finding and removing duplication within data without compromising its fidelity or integrity. The goal is to store more data in less space by segmenting files into small variable-sized chunks, identifying duplicate chunks, and maintaining a single copy of each chunk. Data deduplication technologies are typically implemented one of two ways; at the operating system level, or at the storage system level and the operating system is unaware of it being used.	OS Level: Not Supported for Exchange mailbox databases, transport databases, or content index files. Storage System Level: Supported, but falls within the Microsoft third-party storage software solutions support policy. **Note:** OS level dedupe can be used for Exchange database files that are completely offline (used as backups or archives).	OS Level: Not Supported for Exchange mailbox databases, transport databases, or content index files. Storage Level: Supported, but falls within the Microsoft third-party storage software solutions support policy. **Note:** OS level dedupe can be used for Exchange database files that are completely offline (used as backups or archives).

Network ports for clients and mail flow in Exchange

8/3/2020 • 9 minutes to read • Edit Online

This topic provides information about the network ports that are used by Exchange Server 2016 and Exchange Server 2019 for communication with email clients, internet mail servers, and other services that are external to your local Exchange organization. Before we get into that, understand the following ground rules:

- We do not support restricting or altering network traffic between internal Exchange servers, between internal Exchange servers and internal Lync or Skype for Business servers, or between internal Exchange servers and internal Active Directory domain controllers in any and all types of topologies. If you have firewalls or network devices that could potentially restrict or alter this kind of internal network traffic, you need to configure rules that allow free and unrestricted communication between these servers: rules that allow incoming and outgoing network traffic on any port (including random RPC ports) and any protocol that never alter bits on the wire.

- Edge Transport servers are almost always located in a perimeter network, so it's expected that you'll restrict network traffic between the Edge Transport server and the internet, and between the Edge Transport server and your internal Exchange organization. These network ports are described in this topic.

- It's expected that you'll restrict network traffic between external clients and services and your internal Exchange organization. It's also OK if you decide to restrict network traffic between internal clients and internal Exchange servers. These network ports are described in this topic.

Network ports required for clients and services

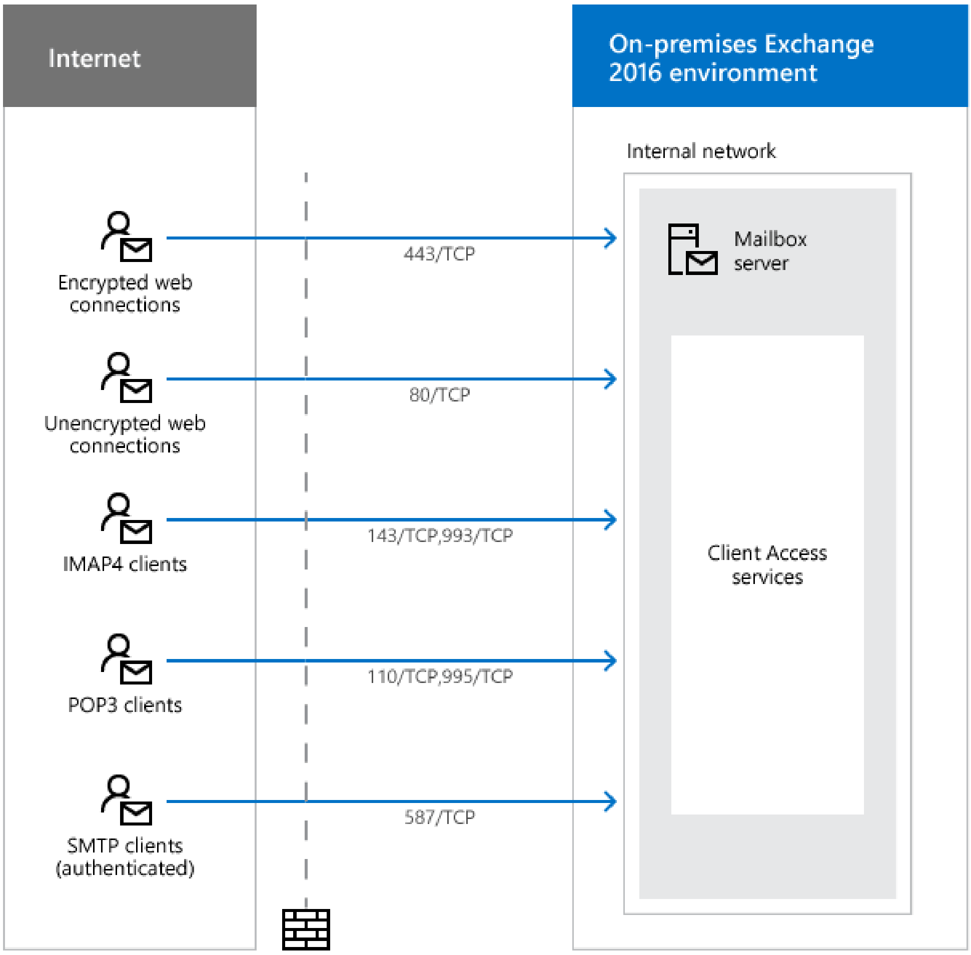
The network ports that are required for email clients to access mailboxes and other services in the Exchange organization are described in the following diagram and table.

Notes:

- The destination for these clients and services is the Client Access services on a Mailbox server. In Exchange 2016 and Exchange 2019, Client Access (frontend) and backend services are installed together on the same Mailbox server. For more information, see Client Access protocol architecture.

- Although the diagram shows clients and services from the internet, the concepts are the same for internal clients (for example, clients in an accounts forest accessing Exchange servers in a resource forest). Similarly, the table doesn't have a source column because the source could be any location that's external to the Exchange organization (for example, the internet or an accounts forest).

- Edge Transport servers have no involvement in the network traffic that's associated with these clients and services.



PURPOSE	PORTS	COMMENTS
Encrypted web connections are used by the following clients and services: • Autodiscover service • Exchange ActiveSync • Exchange Web Services (EWS) • Offline address book (OAB) distribution • Outlook Anywhere (RPC over HTTP) • Outlook MAPI over HTTP • Outlook on the web (formerly known as Outlook Web App)	443/TCP (HTTPS)	For more information about these clients and services, see the following topics: • Autodiscover service in Exchange Server • Exchange ActiveSync • EWS reference for Exchange • Offline address books in Exchange Server • Outlook Anywhere • MAPI over HTTP in Exchange Server
Unencrypted web connections are used by the following clients and services: • Internet calendar publishing • Outlook on the web (redirect to 443/TCP) • Autodiscover (fallback when 443/TCP isn't available)	80/TCP (HTTP)	Whenever possible, we recommend using encrypted web connections on 443/TCP to help protect data and credentials. However, you may find that some services must be configured to use unencrypted web connections on 80/TCP to the Client Access services on Mailbox servers. For more information about these clients and services, see the following topics: • Enable Internet Calendar Publishing • Autodiscover service in Exchange Server

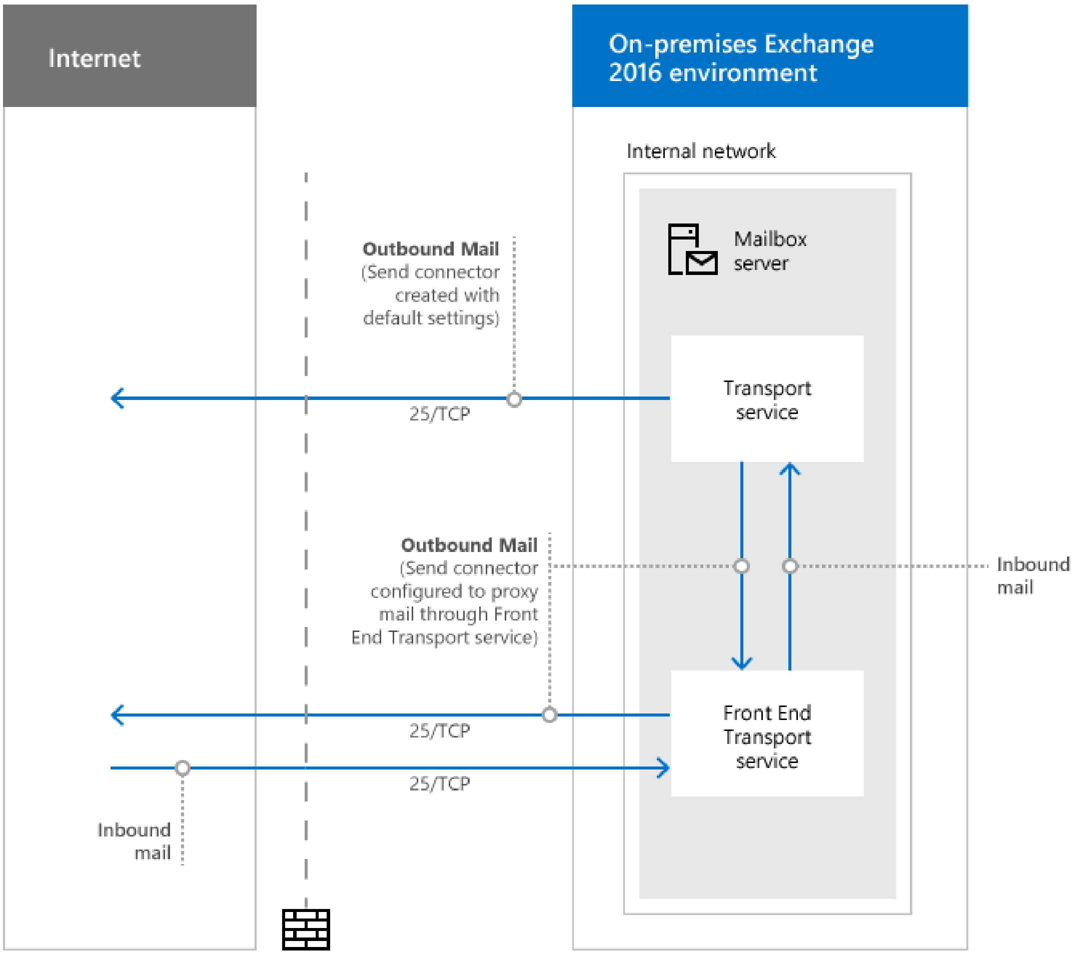
PURPOSE	PORTS	COMMENTS
IMAP4 clients	143/TCP (IMAP), 993/TCP (secure IMAP)	IMAP4 is disabled by default. For more information, see POP3 and IMAP4 in Exchange Server. The IMAP4 service in the Client Access services on the Mailbox server proxies connections to the IMAP4 Backend service on a Mailbox server.
POP3 clients	110/TCP (POP3), 995/TCP (secure POP3)	POP3 is disabled by default. For more information, see POP3 and IMAP4 in Exchange Server. The POP3 service in the Client Access services on the Mailbox server proxies connections to the POP3 Backend service on a Mailbox server.
SMTP clients (authenticated)	587/TCP (authenticated SMTP)	The default Received connector named "Client Frontend *<Server name>*" in the Front End Transport service listens for authenticated SMTP client submissions on port 587. **Note**: If you have email clients that are only able to submit authenticated SMTP email on port 25, you can modify the network adapter bindings of the client Receive connector to also listen for authenticated SMTP email submissions on port 25.

Network ports required for mail flow

How mail is delivered to and from your Exchange organization depends on your Exchange topology. The most important factor is whether you have a subscribed Edge Transport server deployed in your perimeter network.

Network ports required for mail flow (no Edge Transport servers)

The network ports that are required for mail flow in an Exchange organization that has only Mailbox servers are described in the following diagram and table.



Internet
On-premises Exchange 2016 environment
Internal network
Mailbox server
Outbound Mail (Send connector created with default settings)
25/TCP
Transport service
Outbound Mail (Send connector configured to proxy mail through Front End Transport service)
Inbound mail
25/TCP
25/TCP
Front End Transport service
Inbound mail

PURPOSE	PORTS	SOURCE	DESTINATION	COMMENTS
Inbound mail	25/TCP (SMTP)	Internet (any)	Mailbox server	The default Receive connector named "Default Frontend *<Mailbox server name>*" in the Front End Transport service listens for anonymous inbound SMTP mail on port 25. Mail is relayed from the Front End Transport service to the Transport service on a Mailbox server using the implicit and invisible intra-organization Send connector that automatically routes mail between Exchange servers in the same organization. For more information, see Implicit Send connectors.

PURPOSE	PORTS	SOURCE	DESTINATION	COMMENTS
Outbound mail	25/TCP (SMTP)	Mailbox server	Internet (any)	By default, Exchange doesn't create any Send connectors that allow you to send mail to the internet. You have to create Send connectors manually. For more information, see Create a Send connector to send mail to the internet.
Outbound mail (if proxied through the Front End transport service)	25/TCP (SMTP)	Mailbox server	Internet (any)	Outbound mail is proxied through the Front End Transport service only when a Send connector is configured with **Proxy through Client Access server** in the Exchange admin center or `-FrontEndProxyEnabled $true` in the Exchange Management Shell. In this case, the default Receive connector named "Outbound Proxy Frontend *<Mailbox server name>*" in the Front End Transport service listens for outbound mail from the Transport service on a Mailbox server. For more information, see Configure Send connectors to proxy outbound mail.
DNS for name resolution of the next mail hop (not pictured)	53/UDP,53/TCP (DNS)	Mailbox server	DNS server	See the Name resolution section in this topic.

Network ports required for mail flow with Edge Transport servers

A subscribed Edge Transport server that's installed in your perimeter network affects mail flow in the following ways:

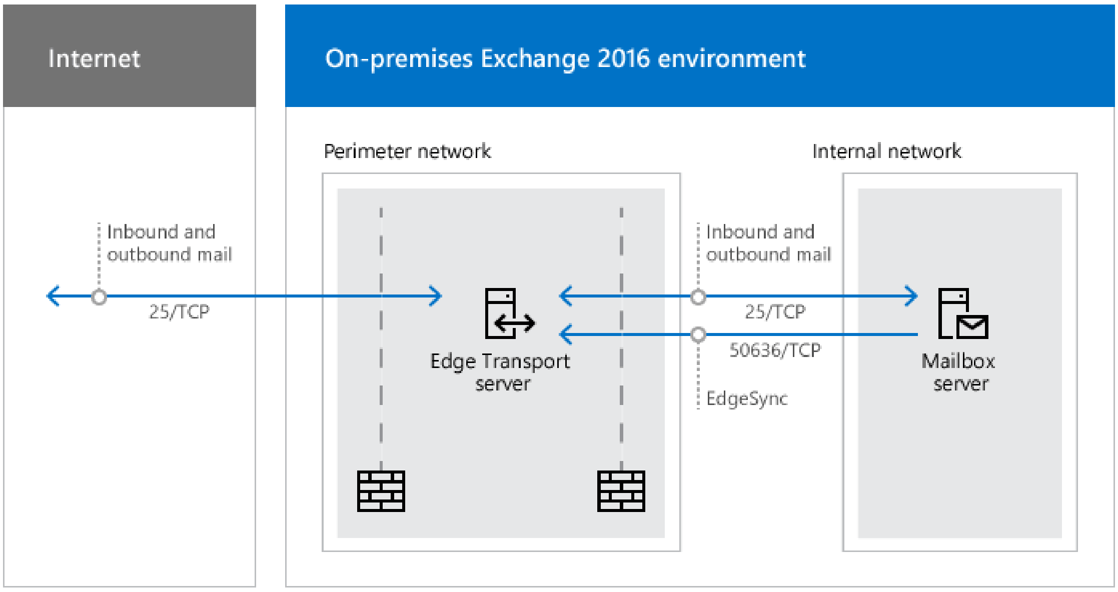
- Outbound mail from the Exchange organization never flows through the Front End Transport service on Mailbox servers. Mail always flows from the Transport service on a Mailbox server in the subscribed Active Directory site to the Edge Transport server (regardless of the version of Exchange on the Edge Transport server).
- Inbound mail flows from the Edge Transport server to a Mailbox server in the subscribed Active Directory

site. Specifically:

- Mail from an Exchange 2013 or later Edge Transport server first arrives at the Front End Transport service before it flows to the Transport service on an Exchange 2016 or Exchange 2019 Mailbox server.
- In Exchange 2016, mail from an Exchange 2010 Edge Transport server always delivers mail directly to the Transport service on an Exchange 2016 Mailbox server. Note that coexistance with Exchange 2010 isn't supported in Exchange 2019.

For more information, see Mail flow and the transport pipeline.

The network ports that are required for mail flow in Exchange organizations that have Edge Transport servers are described in the following diagram and table.



PURPOSE	PORTS	SOURCE	DESTINATION	COMMENTS
Inbound mail - Internet to Edge Transport server	25/TCP (SMTP)	Internet (any)	Edge Transport server	The default Receive connector named "Default internal Receive connector *<Edge Transport server name>*" on the Edge Transport server listens for anonymous SMTP mail on port 25.

PURPOSE	PORTS	SOURCE	DESTINATION	COMMENTS
Inbound mail - Edge Transport server to internal Exchange organization	25/TCP (SMTP)	Edge Transport server	Mailbox servers in the subscribed Active Directory site	The default Send connector named "EdgeSync - Inbound to *<Active Directory site name>*" relays inbound mail on port 25 to any Mailbox server in the subscribed Active Directory site. For more information, see Send connectors created automatically by the Edge Subscription. The default Receive connector named "Default Frontend *<Mailbox server name>*" in the Front End Transport service on the Mailbox server listens for all inbound mail (including mail from Exchange 2013 or later Edge Transport servers) on port 25.

PURPOSE	PORTS	SOURCE	DESTINATION	COMMENTS
Outbound mail - Internal Exchange organization to Edge Transport server	25/TCP (SMTP)	Mailbox servers in the subscribed Active Directory site	Edge Transport servers	Outbound mail always bypasses the Front End Transport service on Mailbox servers. Mail is relayed from the Transport service on any Mailbox server in the subscribed Active Directory site to an Edge Transport server using the implicit and invisible intra-organization Send connector that automatically routes mail between Exchange servers in the same organization. The default Receive connector named "Default internal Receive connector *<Edge Transport server name>*" on the Edge Transport server listens for SMTP mail on port 25 from the Transport service on any Mailbox server in the subscribed Active Directory site.
Outbound mail - Edge Transport server to internet	25/TCP (SMTP)	Edge Transport server	Internet (any)	The default Send connector named "EdgeSync - *<Active Directory site name>* to Internet" relays outbound mail on port 25 from the Edge Transport server to the internet.
EdgeSync synchronization	50636/TCP (secure LDAP)	Mailbox servers in the subscribed Active Directory site that participate in EdgeSync synchronization	Edge Transport servers	When the Edge Transport server is subscribed to the Active Directory site, all Mailbox servers that exist in the site *at the time* participate in EdgeSync synchronization. However, any Mailbox servers that you add later don't *automatically* participate in EdgeSync synchronization.

PURPOSE	PORTS	SOURCE	DESTINATION	COMMENTS
DNS for name resolution of the next mail hop (not pictured)	53/UDP,53/TCP (DNS)	Edge Transport server	DNS server	See the Name resolution section later in this topic.
Open proxy server detection in sender reputation (not pictured)	see comments	Edge Transport server	Internet	By default, sender reputation (the Protocol Analysis agent) uses open proxy server detection as one of the criteria to calculate the sender reputation level (SRL) of the source messaging server. For more information, see Sender reputation and the Protocol Analysis agent. Open proxy server detection uses the following protocols and TCP ports to test source messaging servers for open proxy: • SOCKS4, SOCKS5: 1081, 1080 • Wingate, Telnet, Cisco: 23 • HTTP CONNECT, HTTP POST: 6588, 3128, 80 Also, if your organization uses a proxy server to control outbound internet traffic, you need to define the proxy server name, type, and TCP port that sender reputation requires to access the internet for open proxy server detection. Alternatively, you can disable open proxy server detection in sender reputation. For more information, see Sender reputation procedures.

Name resolution

DNS resolution of the next mail hop is a fundamental part of mail flow in any Exchange organization. Exchange servers that are responsible for receiving inbound mail or delivering outbound mail must be able to resolve both internal and external host names for proper mail routing. And all internal Exchange servers must be able to resolve internal host names for proper mail routing. There are many different ways to design a DNS infrastructure, but the important result is to ensure name resolution for the next hop is working properly for all of your Exchange servers.

Network ports required for hybrid deployments

The network ports that are required for an organization that uses both on-premises Exchange and Microsoft 365 or Office 365 are covered in Hybrid deployment protocols, ports, and endpoints.

Network ports required for Unified Messaging in Exchange 2016

The network ports that are required for Unified Messaging in Exchange 2013 and Exchange 2016 are covered in the topic UM protocols, ports, and services.

Overview of Exchange services on Exchange servers

8/3/2020 • 8 minutes to read • Edit Online

During the installation of Exchange Server 2016 or Exchange Server 2019, Setup runs a set of tasks that install new services in Microsoft Windows. A service is a background process that can be launched during the startup of the server by the Windows Service Control Manager. Services are executable files designed to operate independently and without administrative intervention. A service can run using either a graphical user interface (GUI) mode or a console mode.

All previous versions of Exchange included components that are implemented as services. Each Exchange server role includes services that are part of (or may be needed by) the server role to perform its functions. Note that some services only become active when specific features are used.

The sections in this topic describe the various services that are installed by Exchange 2016 and Exchange 2016 on Mailbox servers and Edge Transport servers. For services that are labeled as optional, you can disable the service if you determine your organization doesn't need the functionality that's provided by the service.

Exchange services on Mailbox servers

The following table describes the Exchange services that are installed on Mailbox servers.

SERVICE NAME	SERVICE SHORT NAME	DESCRIPTION AND DEPENDENCIES	DEFAULT STARTUP TYPE	SECURITY CONTEXT	DEPENDENCIES	REQUIRED OR OPTIONAL
Microsoft Exchange Active Directory Topology	MSExchangeADTopology	Provides Active Directory topology information to Exchange services. If this service is stopped, most Exchange services can't start.	Automatic	Local System	Net.TCP Port Sharing Service	Required

SERVICE NAME	SERVICE SHORT NAME	DESCRIPTION AND DEPENDENCIES	DEFAULT STARTUP TYPE	SECURITY CONTEXT	DEPENDENCIES	REQUIRED OR OPTIONAL
Microsoft Exchange Anti-spam Update	MSExchangeAntispamUpdate	Provides Exchange SmartScreen spam definition updates. **Note**: In November, 2016, Microsoft stopped producing spam definition updates for the SmartScreen filters in Exchange and Outlook. The existing SmartScreen spam definitions were left in place, but their effectiveness will likely degrade over time. For more information, see Deprecating support for SmartScreen in Outlook and Exchange.	Automatic	Local System	Microsoft Exchange Active Directory Topology	Optional
Microsoft Exchange Compliance Audit	MSComplianceAudit	Provides Exchange auditing features.	Automatic	Local System	Microsoft Exchange Active Directory Topology	Required
Microsoft Exchange Compliance Service	MSExchangeCompliance	Provides a host for Exchange compliance services.	Automatic	Local System	Microsoft Exchange Active Directory Topology	Required

SERVICE NAME	SERVICE SHORT NAME	DESCRIPTION AND DEPENDENCIES	DEFAULT STARTUP TYPE	SECURITY CONTEXT	DEPENDENCIES	REQUIRED OR OPTIONAL
Microsoft Exchange DAG Management	MSExchangeDagMgmt	Provides storage and database layout management for Mailbox servers in database availability groups (DAGs).	Automatic	Local System	Microsoft Exchange Active Directory TopologyNet.TCP Port Sharing Service	Required
Microsoft Exchange Diagnostics	MSExchangeDiagnostics	Provides an agent that monitors Exchange server health.	Automatic	Local System	None	Required
Microsoft Exchange EdgeSync	MSExchangeEdgeSync	Replicates configuration and recipient data between the Mailbox server and Active Directory Lightweight Directory Services (AD LDS) on subscribed Edge Transport servers over a secure LDAP channel. If you don't have any subscribed Edge Transport servers, you can disable this service.	Automatic	Local System	Microsoft Exchange Active Directory Topology	Optional
Microsoft Exchange Frontend Transport	MSExchangeFrontEndTransport	Proxies SMTP connections from external hosts to the Microsoft Exchange Transport service on Mailbox servers (the local server or remote servers).	Automatic	Local System	Microsoft Exchange Active Directory Topology	Required

SERVICE NAME	SERVICE SHORT NAME	DESCRIPTION AND DEPENDENCIES	DEFAULT STARTUP TYPE	SECURITY CONTEXT	DEPENDENCIES	REQUIRED OR OPTIONAL
Microsoft Exchange Health Manager	MSExchangeHM	Part of managed availability that monitors the health of key components on the Exchange server.	Automatic	Local System	Windows Event LogWindows Management Instrumentation	Required
Microsoft Exchange Health Manager Recovery	MSExchangeHMRecovery	Part of managed availability that attempts to recover unhealthy components on the Exchange server.	Automatic	Local System	• Windows Event Log • Windows Management Instrumentation	Required

SERVICE NAME	SERVICE SHORT NAME	DESCRIPTION AND DEPENDENCIES	DEFAULT STARTUP TYPE	SECURITY CONTEXT	DEPENDENCIES	REQUIRED OR OPTIONAL
Microsoft Exchange IMAP4	MSExchangeIMAP4	Proxies IMAP4 client connections from the Client Access (frontend) services to the backend IMAP4 service on Mailbox servers. By default, this service isn't running, so IMAP4 clients can't connect to the Exchange server until this service is started. If you don't have any IMAP4 clients, you can disable this service.	Manual	Local System	Microsoft Exchange Active Directory Topology	Optional
Microsoft Exchange IMAP4 Backend	MSExchangeIMAP4BE	Receives proxied IMAP4 client connections from the from the Client Access (frontend) IMAP4 service. By default, this service isn't running, so IMAP4 clients can't connect to the Exchange server until this service is started. If you don't have any IMAP4 clients, you can disable this service.	Manual	Network Service	Microsoft Exchange Active Directory Topology	Optional

SERVICE NAME	SERVICE SHORT NAME	DESCRIPTION AND DEPENDENCIES	DEFAULT STARTUP TYPE	SECURITY CONTEXT	DEPENDENCIES	REQUIRED OR OPTIONAL
Microsoft Exchange Information Store	MSExchangeIS	Manages the mailbox databases on the server. If this service is stopped, mailbox databases on the server are unavailable.	Automatic	Local System	• Microsoft Exchange Active Directory Topology • Remote Procedure Call (RPC) • Server • Windows Event Log • Workstation	Required
Microsoft Exchange Mailbox Assistants	MSExchangeMailboxAssistants	Performs background processing of mailboxes in mailbox databases on the server.	Automatic	Local System	Microsoft Exchange Active Directory Topology	Required
Microsoft Exchange Mailbox Replication	MSExchangeMailboxReplication	Processes mailbox moves and move requests.	Automatic	Local System	Microsoft Exchange Active Directory TopologyNet.TCP Port Sharing Service	Rquired
Microsoft Exchange Mailbox Transport Delivery	MSExchangeDelivery	Receives SMTP messages from the Microsoft Exchange Transport service (on the local or remote Mailbox servers) and delivers them to a local mailbox database using RPC.	Automatic	Network Service	Microsoft Exchange Active Directory Topology	Required

SERVICE NAME	SERVICE SHORT NAME	DESCRIPTION AND DEPENDENCIES	DEFAULT STARTUP TYPE	SECURITY CONTEXT	DEPENDENCIES	REQUIRED OR OPTIONAL
Microsoft Exchange Mailbox Transport Submission	MSExchangeSubmission	Receives RPC messages from a local mailbox database, and submits them over SMTP to the Microsoft Exchange Transport service (on the local or remote Mailbox servers).	Automatic	Local System	Microsoft Exchange Active Directory Topology	Required
Microsoft Exchange Notifications Broker	MSExchangeNotificationsBroker	Provides Exchange notifications to local and remote Exchange processes.	Automatic	Local System	Microsoft Exchange Active Directory Topology • Net.TCP Port Sharing Service	Required
Microsoft Exchange POP3	MSExchangePOP3	Proxies POP3 client connections from the Client Access (frontend) services to the backend IMAP4 service on Mailbox servers. By default, this service isn't running, so POP3 clients can't connect to the Exchange server until this service is started.	Manual	Network Service	Microsoft Exchange Active Directory Topology	Optional

SERVICE NAME	SERVICE SHORT NAME	DESCRIPTION AND DEPENDENCIES	DEFAULT STARTUP TYPE	SECURITY CONTEXT	DEPENDENCIES	REQUIRED OR OPTIONAL
Microsoft Exchange POP3 Backend	MSExchangePOP3BE	Receives proxied POP3 client connections from the from the Client Access (frontend) POP3 service. By default, this service isn't running, so POP3 clients can't connect to the Exchange server until this service is started.	Manual	Network Service	Microsoft Exchange Active Directory Topology	Optional
Microsoft Exchange Replication Service	MSExchangeRepl	Provides replication functionality for mailbox databases in a database availability groups (DAGs).	Automatic	Local System	Microsoft Exchange Active Directory Topology	Required
Microsoft Exchange RPC Client Access	MSExchangeRPC	Manages client RPC connections for Exchange.	Automatic	Network Service	Microsoft Exchange Active Directory Topology	Required
Microsoft Exchange Search	MSExchangeFastSearch	Provides indexing of mailbox content, which improves the performance of content search.	Automatic	Local System	Microsoft Exchange Active Directory Topology	Required
Microsoft Exchange Search Host Controller	HostControllerService	Provides deployment and management services for applications on the local Exchange server.	Automatic	Local System	HTTP Service	Requirerd

SERVICE NAME	SERVICE SHORT NAME	DESCRIPTION AND DEPENDENCIES	DEFAULT STARTUP TYPE	SECURITY CONTEXT	DEPENDENCIES	REQUIRED OR OPTIONAL
Microsoft Exchange Server Extension for Windows Server Backup	WSBExchange	Enables Windows Server Backup to back and restore Exchange server data.	Manual	Local System	None	Optional
Microsoft Exchange Service Host	MSExchangeServiceHost	Provides a service host for Exchange components that don't have their own services.	Automatic	Local System	Microsoft Exchange Active Directory Topology	Required
Microsoft Exchange Throttling	MSExchangeThrottling	Provides user workload management that limits the rate of user operations (formerly known as user throttling).	Automatic	Network Service	Microsoft Exchange Active Directory Topology	Required
Microsoft Exchange Transport	MSExchangeTransport	Provides SMTP server and transport stack.	Automatic	Network Service	Microsoft Exchange Active Directory Topology • Microsoft Filtering Management Service	Required
Microsoft Exchange Transport Log Search	MSExchangeTransportLogSearch	Provides remote search capability for transport log files (for example, message tracking).	Automatic	Local System	Microsoft Exchange Active Directory Topology	Optional

SERVICE NAME	SERVICE SHORT NAME	DESCRIPTION AND DEPENDENCIES	DEFAULT STARTUP TYPE	SECURITY CONTEXT	DEPENDENCIES	REQUIRED OR OPTIONAL
Microsoft Exchange Unified Messaging (Exchange 2016 only)	MSExchangeUM	Provides Unified Messaging (UM) features: allows voice and fax messages to be stored in Exchange 2016 and gives users telephone access to email, voice mail, calendar, contacts, or an auto attendant. If this service is stopped, Unified Messaging isn't available. If you don't use UM in Exchange 2016, you can disable this service.	Automatic	Local System	• CNG Key Isolation • Microsoft Exchange Active Directory Topology	Optional
Microsoft Exchange Unified Messaging Call Router (Exchange 2016 only)	MSExchangeUMCR	Redirects UM client connections from the Client Access (frontend) services to the backend Unified Messaging service on Exchange 2016 Mailbox servers. If you don't use UM in Exchange 2016, you can disable this service.	Automatic	Local System	• CNG Key Isolation • Microsoft Exchange Active Directory Topology	Optional

Exchange services on Edge Transport servers

The following table describes the Exchange services that are installed on Edge Transport servers.

SERVICE NAME	SERVICE SHORT NAME	DESCRIPTION	DEFAULT STARTUP TYPE	SECURITY CONTEXT	DEPENDENCIES	REQUIRED OR OPTIONAL
Microsoft Exchange ADAM	ADAM_MSExchange	Stores configuration data and recipient data on the Edge Transport server. This service represents the named instance of the Active Directory Lightweight Directory Services (AD LDS) that's automatically created by Exchange Setup.	Automatic	Network Service	COM+ Event System	Required

SERVICE NAME	SERVICE SHORT NAME	DESCRIPTION	DEFAULT STARTUP TYPE	SECURITY CONTEXT	DEPENDENCIES	REQUIRED OR OPTIONAL
Microsoft Exchange Anti-spam Update	MSExchangeAntispamUpdate	Provides Exchange SmartScreen spam definition updates. **Note**: In November, 2016, Microsoft stopped producing spam definition updates for the SmartScreen filters in Exchange and Outlook. The existing SmartScreen spam definitions were left in place, but their effectiveness will likely degrade over time. For more information, see Deprecating support for SmartScreen in Outlook and Exchange.	Automatic	Local System	Microsoft Exchange ADAM	Optional
Microsoft Exchange Credential Service	MSExchangeEdgeCredential	Monitors credential changes in Active Directory Lightweight Directory Services (AD LDS) and installs the changes on the Edge Transport server.	Automatic	Local System	Microsoft Exchange ADAM	Required

SERVICE NAME	SERVICE SHORT NAME	DESCRIPTION	DEFAULT STARTUP TYPE	SECURITY CONTEXT	DEPENDENCIES	REQUIRED OR OPTIONAL
Microsoft Exchange Diagnostics	MSExchangeDiagnostics	Provides an agent that monitors Exchange server health.	Automatic	Local System	None	Required
Microsoft Exchange Health Manager	MSExchangeHM	Part of managed availability that monitors the health of key components on the Exchange server.	Automatic	Local System	• Windows Event Log • Windows Management Instrumentation	Required
Microsoft Exchange Health Manager Recovery	MSExchangeHMRecovery	Part of managed availability that attempts to recover unhealthy components on the Exchange server.	Automatic	Local System	Windows Event LogWindows Management Instrumentation	Required
Microsoft Exchange Service Host	MSExchangeServiceHost	Provides a service host for Exchange components that don't have their own services.	Automatic	Local System	Microsoft Exchange ADAM	Required
Microsoft Exchange Transport	MSExchangeTransport	Provides SMTP server and transport stack.	Automatic	Network Service	Microsoft Exchange ADAM	Required
Microsoft Exchange Transport Log Search	MSExchangeTransportLogSearch	Provides remote search capability for transport log files (for example, message tracking).	Automatic	Local System	Microsoft Exchange ADAM	Optional

Exchange 2019 preferred architecture

8/3/2020 • 16 minutes to read • Edit Online

With each new release of Exchange Server for our on-premises customers we update our Preferred Architecture and discuss what changes we would like our customers to be aware of. Exchange Server 2013 brought us the first of the Preferred Architectures in modern Exchange history and was then followed with a refresh for Exchange Server 2016 by providing refinements for the changes that came with the 2016 release. With this update for Exchange Server 2019 we will iterate on the previous PA to take advantage of new technologies and improvements.

The preferred architecture

The PA is the Exchange Server Engineering Team's best practice recommendation for what we believe is the optimum deployment architecture for Exchange Server 2019 in an on-premises environment.

While Exchange 2019 offers a wide variety of architectural choices for on-premises deployments, the architecture discussed here is the most scrutinized one. While there are other supported deployment architectures, they are not our recommended practice.

Following the PA helps customers become a member of a community of organizations with similar Exchange Server deployments. This allows easier knowledge sharing and facilitates a more rapid response to unforeseen circumstances. Our own support organization is well aware what an Exchange Server PA deployment should look like and prevents them from spending lengthy cycles learning and understanding a customer's highly custom environment before working with them towards a support case resolution.

The PA is designed with several business requirements in mind, such as the requirement that the architecture be able to:

- Include both high availability within the datacenter, and site resilience between datacenters
- Support multiple copies of each database, thereby allowing for quick activation
- Reduce the cost of the messaging infrastructure
- Increase availability by optimizing around failure domains and reducing complexity

The specific prescriptive nature of the PA means of course that not every customer will be able to deploy it word for word. For example, not all our customers have multiple datacenters. Some of our customers may have different business requirements or internal policies they must adhere to which necessitate a different deployment architecture. If you fall into those categories, and you want to deploy Exchange on-premises, there are still advantages to adhering as closely as possible to the PA and deviate only where your requirements or policies force you to differ. Alternatively, you can always consider Microsoft 365 or Office 365 where you no longer must deploy or manage a large number of servers.

The PA removes complexity and redundancy where necessary to drive the architecture to a predictable recovery model: when a failure occurs, another copy of the affected database is activated.

The PA covers the following four areas of focus:

1. Namespace design
2. Site resilient datacenter pair design
3. Server design

4. Database availability group design

For Exchange Server 2019 we have no changes in three of the four categories from the Exchange Server 2016 Preferred Architecture. The areas of Namespace design, Datacenter design, and DAG design are receiving no major changes. We have been very pleased with customer deployments that closely followed the Exchange Server 2016 PA and see no need to deviate from the recommendations in those areas.

The most noteworthy changes in the Exchange Server 2019 PA focus on the area of Server design due to some new and exciting technologies.

Namespace design

In the Namespace Planning and Load Balancing Principles articles for Exchange Server 2016, Ross Smith IV outlined the various configuration choices that were available with Exchange 2016 and these concepts continue to apply for Exchange Server 2019. For the namespace, the choices are to either deploy a bound namespace (having a preference for the users to operate out of a specific datacenter) or an unbound namespace (having the users connect to any datacenter without preference).

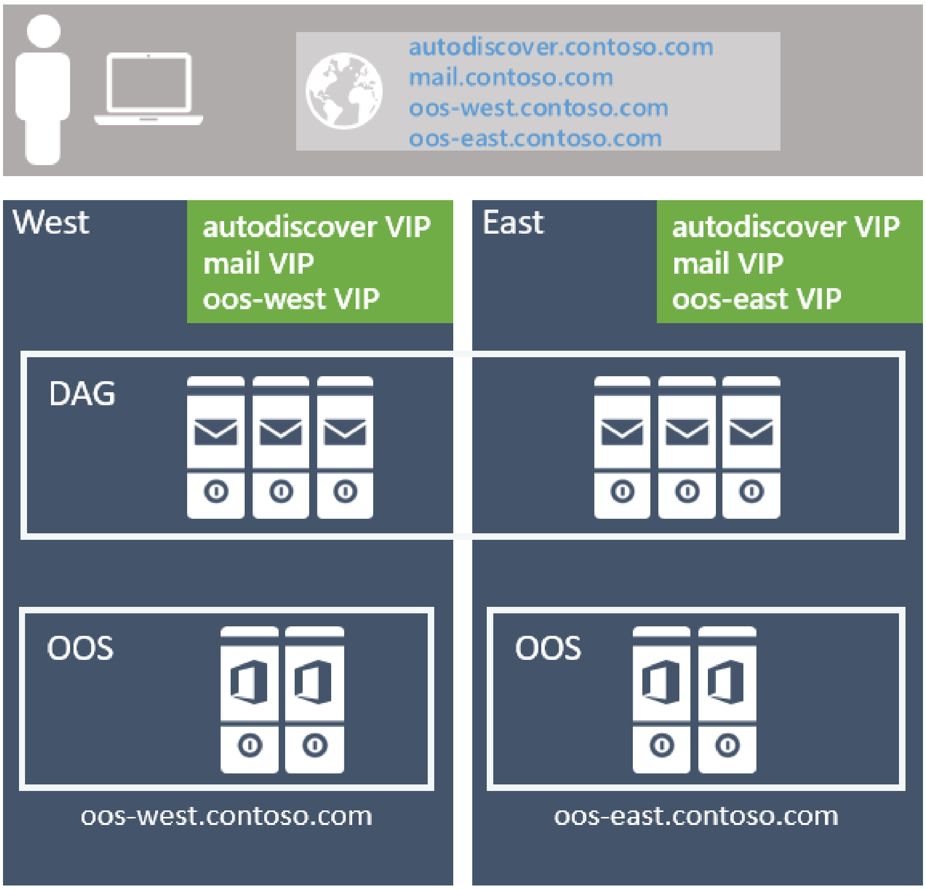
The recommended approach is to utilize the unbounded model, deploying a single Exchange namespace per client protocol for the site resilient datacenter pair (where each datacenter is assumed to represent its own Active Directory site - see more details on that below). For example:

- For the Autodiscover service: autodiscover.contoso.com
- For HTTP clients: mail.contoso.com
- For IMAP clients: imap.contoso.com
- For SMTP clients: smtp.contoso.com

Each Exchange namespace is load balanced across both datacenters in a layer 7 configuration that does not leverage session affinity, resulting in fifty percent of traffic being proxied between datacenters. Traffic is equally distributed across the datacenters in the site resilient pair, via round robin DNS, geo-DNS, or other similar solutions. From our perspective, the simpler solution is the least complex and easier to manage, so our recommendation is to leverage round robin DNS.

One caution we have for customers is to ensure you assign a low TTL (time to live) value for any DNS record associated with your Exchange architecture. In the event if a full datacenter outage when using round robin DNS you must maintain the ability to quickly update your DNS records to remove the IP addresses from the offline datacenter so they are not returned for DNS queries. For example, if your DNS records have a longer TTL value of 24 hours it may take up to a day for downstream DNS caches to properly update. If you do not perform this step you may find some clients are unable to properly transition to the still available IP addresses in your remaining datacenter. Do not forget to add the IP addresses back to your DNS records when your previously offline datacenter is recovered and ready to host services once again.

Datacenter affinity is required for the Office Online Server farms, thus a namespace is deployed per datacenter with the load balancer utilizing layer 7, and maintaining session affinity via cookie-based persistence.



In the event that you have multiple site resilient datacenter pairs in your environment, you will need to decide if you want to have a single worldwide namespace, or if you want to control the traffic to each specific datacenter by using regional namespaces. Your decision depends on your network topology and the associated cost with using an unbound model; for example, if you have datacenters located in North America and South Africa, the network link between these regions might not only be costly, but it might also have high latency, which can introduce user pain and operational issues. In that case, it makes sense to deploy a bound model with a separate namespace for each region. However, options like geographical DNS offer you the ability to deploy a single unified namespace, even when you have costly network links; geo-DNS allows you to have your users directed to the closest datacenter based on their client's IP address.

Site resilient datacenter pair design

To achieve a highly available *and* site resilient architecture, you must have two or more datacenters that are well-connected (ideally, you want a low round-trip network latency, otherwise replication and the client experience are adversely affected). In addition, the datacenters should be connected via redundant network paths supplied by different operating carriers.

While we support stretching an Active Directory site across multiple datacenters, for the PA we recommend that each datacenter be its own Active Directory site. There are two reasons:

1. Transport site resilience via Shadow redundancy in Exchange Server and Safety Net in Exchange Server can only be achieved when the DAG has members located in more than one Active Directory site.

2. Active Directory has published guidance that states that subnets should be placed in different Active Directory sites when the round trip latency is greater than 10ms between the subnets.

Server design

In the PA, all servers are physical servers and use locally attached storage. Physical hardware is deployed rather than virtualized hardware for two reasons:

1. The servers are scaled to use 80% of resources during the worst-failure mode.
2. Virtualization comes with a slight performance penalty as well as adding an additional layer of management and complexity, which introduces additional recovery modes that do not add value, particularly since Exchange Server natively provides the same functionality.

Commodity servers

Commodity server platforms are used in the PA. Current commodity platforms are and include:

- 2U, dual socket servers with up to 48 physical processor cores (an increase from 24 cores in Exchange 2016)
- Up to 256GB of memory (an increase from 192GB in Exchange 2016)
- A battery-backed write cache controller
- 12 or more drive bays within the server chassis
- The ability to mix traditional rotating platter storage (HDD) and solid-state storage (SSD) within the same chassis.

Scale Theory

It is important to note even though we have increased the allowed processor and memory capacity in Exchange Server 2019 the Exchange Server PG's recommendation remains to scale out rather than up. Scaling out vs up means we would much rather see you deploy a larger number of servers with slightly less resources per server rather than a smaller number of very dense servers using maximum resources and populated with large numbers of mailboxes. By locating a reasonable number of mailboxes within a server, you lessen the impact of any planned or unplanned outage as well as reduce the risk of discovering other system bottlenecks.

An increase in system resources should not result in the assumption you will see linear performance gains in Exchange Server 2019 using the maximum allowed resources when comparing it to Exchange 2016's maximum allowed resources. Each new version of Exchange brings new processes and updates which in turn make it difficult to compare a current version to prior version. Please follow any and all sizing guidance from Microsoft when determining your server design.

Storage

Additional drive bays may be directly attached per-server depending on the number of mailboxes, mailbox size, and the server's resource scalability.

Each server houses a single RAID1 disk pair for the operating system, Exchange binaries, protocol/client logs, and the transport database.

The remaining storage is configured as JBOD (Just a Bunch of Disks). Please be aware some hardware storage controllers may require each disk to each be configured as a single-disk RAID0 group for write caching to be utilized. Consult with your hardware manufacturer to confirm the proper configuration for your system that guarantees write-cache will be utilized.

New to the Exchange Server 2019 PA is the recommendation of having two classes of storage for everything not already located on the RAID1 disk pair previously mentioned.

Traditional storage class

This storage class contains Exchange Server database files and Exchange Server transaction log files. These disks are large capacity 7.2K RPM serially attached SCSI (SAS) disks. While SATA disks are also available we observe better IO and a lower annualized failure rate using the SAS equivalent.

To ensure the capacity and IO of each disk is used as efficiently as possible, up to four database copies are deployed per-disk. The normal run-time copy layout ensures that there is no more than a single active database copy per disk.

At least one disk in the traditional storage disk pool is reserved as a hot spare. AutoReseed is enabled and quickly restores database redundancy after a disk failure by activating the hot spare and initiating database copy reseeds.

Solid state storage class

This storage class contains Exchange 2019's new MetaCache Database (MCDB) files. These solid-state drives may come in different form factors such as but not limited to traditional 2.5"/3.5" SAS connected or M.2 PCIe connected drives.

Customers should expect to deploy roughly 5-10% additional storage as solid state storage. For example, if a single server was expected to hold 28TB of mailbox database files on traditional storage, then an additional 1.4-2.8TB TB of solid-state storage would also be recommended as additional storage for the same server.

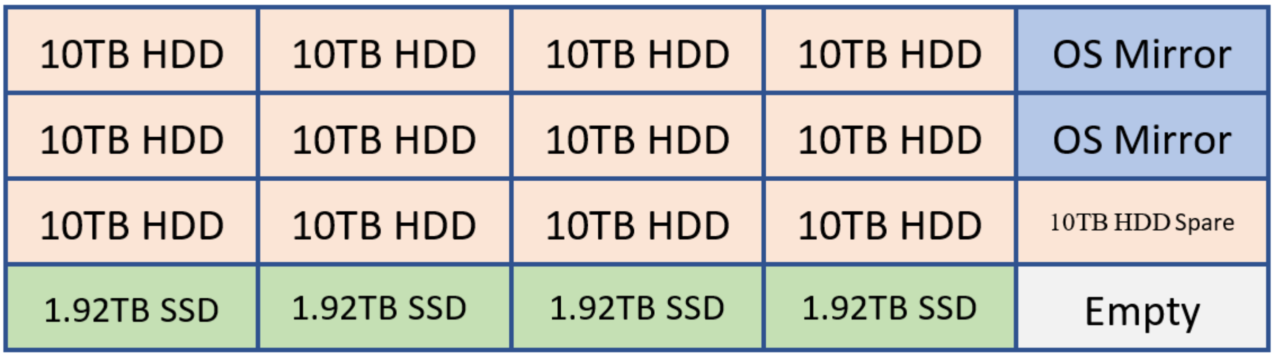
Traditional and solid-state disks should be deployed in a 3:1 ratio where possible. For every three traditional disks within the server a single solid-state disk will be deployed and hold the MCDBs for all DBs within the three associated traditional disks. This recommendation limits the failure domain a solid-state drive failure can impose on a system. When an SSD fails, Exchange 2019 will failover all database copies using that SSD for their MCDB to another DAG node with healthy MCDB resources for the affected database. Limiting the number of database failovers reduce the chance of impacting users if many more databases were sharing a smaller number of solid-state drives.

In the event of a solid-state drive failure Exchange High Availability services will attempt to mount the affected databases on different DAG nodes where a healthy MCDB for each affected database still exists. If for some reason no healthy MCDBs exist for one of the affected databases, then Exchange High Availability services will leave the local affected database copy running without the performance benefits of the MCDB.

For example, if a customer were to deploy a system capable of holding 20 drives it may have a layout like the following.

- 2 HDDs for OS mirror, Exchange Binaries, and Transport Database
- 12 HDDs for Exchange Database storage
- 1 HDD as the AutoReseed spare
- 4 SSDs for Exchange MCDBs that provide between 5-10% of the cumulative database storage capacity.
- Optionally a customer may elect to add a spare SSD or a second AutoReseed drive.

This can be visualized as the following;



10TB HDD	10TB HDD	10TB HDD	10TB HDD	OS Mirror
10TB HDD	10TB HDD	10TB HDD	10TB HDD	OS Mirror
10TB HDD	10TB HDD	10TB HDD	10TB HDD	10TB HDD Spare
1.92TB SSD	1.92TB SSD	1.92TB SSD	1.92TB SSD	Empty

In the example above, we have 120 TB of Exchange database storage and 7.68 TB of MCDB storage which is roughly 6.4% the traditional database storage space. With this amount of MCBD storage we are perfectly aligned within the guidance of 5-10%. Each of the 10 TB drives will hold four database copies and each MCDB drive would hold twelve MCDBs.

Common storage settings

Whether Traditional or Solid-State, all disks that houses an Exchange data are formatted with ReFS (with the integrity feature disabled) and the DAG is configured such that AutoReseed formats the disks with ReFS:

```
Set-DatabaseAvailabilityGroup -Identity <DAGIdentity> -FileSystem ReFS
```

BitLocker is used to encrypt each disk, thereby providing data encryption at rest and mitigating concerns around data theft or disk replacement. For more information, see Enabling BitLocker on Exchange Servers.

Database availability group design

Within each site resilient datacenter pair, you will have one or more DAGs. It is not recommended to stretch a DAG across more than two datacenters.

DAG configuration

As with the namespace model, each DAG within the site resilient datacenter pair operates in an unbound model with active copies distributed equally across all servers in the DAG. This model:

1. Ensures that each DAG member's full stack of services (client connectivity, replication pipeline, transport, etc.) is being validated during normal operations.

2. Distributes the load across as many servers as possible during a failure scenario, thereby only incrementally increasing resource use across the remaining members within the DAG.

Each datacenter is symmetrical, with an equal number of DAG members in each datacenter. This means that each DAG has an even number of servers and uses a witness server for quorum maintenance.

The DAG is the fundamental building block in Exchange 2019. With respect to DAG size, a DAG with a greater number of participating member nodes provides more redundancy and resources. Within the PA, the goal is to deploy DAGs with a greater number of member nodes, typically starting with an eight-member DAG and increasing the number of servers as required to meet your requirements. You should only create new DAGs when scalability introduces concerns over the existing database copy layout.

DAG network design

The PA leverages a single, non-teamed network interface for both client connectivity and data replication. A single network interface is all that is needed because ultimately our goal is to achieve a standard recovery model regardless of the failure - whether a server failure occurs, or a network failure occurs, the result is the same: a database copy is activated on another server within the DAG. This architectural change simplifies the network stack and obviates the need to manually eliminate heartbeat cross-talk.

Witness server placement

The placement of the witness server determines whether the architecture can provide automatic datacenter failover capabilities or whether it will require a manual activation to enable service in the event of a site failure.

If your organization has a third location with a network infrastructure that is isolated from network failures that affect the site resilient datacenter pair in which the DAG is deployed, then the recommendation is to deploy the DAG's witness server in that third location. This configuration gives the DAG the ability to automatically failover databases to the other datacenter in response to a datacenter-level failure event, regardless of which datacenter has the outage.

If your organization does not have a third location, consider placing the server witness in Azure; alternatively, place the witness server in one of the datacenters within the site resilient datacenter pair. If you have multiple DAGs within the site resilient datacenter pair, then place the witness server for all DAGs in the same datacenter (typically the datacenter where the majority of the users are physically located). Also, make sure the Primary Active Manager (PAM) for each DAG is also located in the same datacenter.

Exchange Server 2019 and all earlier versions do not support the use of the Cloud Witness feature first introduced in Windows Server 2016 Failover Cluster.

Data resiliency

Data resiliency is achieved by deploying multiple database copies. In the PA, database copies are distributed across the site resilient datacenter pair, thereby ensuring that mailbox data is protected from software, hardware and even datacenter failures.

Each database has four copies, with two copies in each datacenter, which means at a minimum, the PA requires four servers. Out of these four copies, three of them are configured as highly available. The fourth copy (the copy with the highest Activation Preference number) is configured as a lagged database copy. Due to the server design, each copy of a database is isolated from its other copies, thereby reducing failure domains and increasing the overall availability of the solution as discussed in DAG: Beyond the "A".

The purpose of the lagged database copy is to provide a recovery mechanism for the rare event of system-wide, catastrophic logical corruption. It is not intended for individual mailbox recovery or mailbox item recovery.

The lagged database copy is configured with a seven day ReplayLagTime. In addition, the Replay Lag Manager is also enabled to provide dynamic log file play down for lagged copies when availability is compromised due to the loss of non-lagged copies.

By using the lagged database copy in this manner, it is important to understand that the lagged database copy is not a guaranteed point-in-time backup. The lagged database copy will have an availability threshold, typically around 90%, due to periods where the disk containing a lagged copy is lost due to disk failure, the lagged copy becoming an HA copy (due to automatic play down), as well as, the periods where the lagged database copy is re-building the replay queue.

To protect against accidental (or malicious) item deletion, Single Item Recover or In-Place Hold technologies are used, and the Deleted Item Retention window is set to a value that meets or exceeds any defined item-level recovery SLA.

With all of these technologies in play, traditional backups are unnecessary; as a result, the PA leverages Exchange Native Data Protection.

Office Online Server design

At a minimum, you will want to deploy an Office Online Server (OOS) farm with at least two OOS nodes in each datacenter that hosts Exchange 2019 servers. Each Office Online Server should have at least 8 processor cores, 32GB of memory and at least 40GB of space dedicated for log files. Exchange 2019 mailbox servers should be configured to rely on the local OOS farm in their datacenter to ensure the lowest possible latency and highest possible bandwidth between the servers to render file content to users.

Summary

Exchange Server 2019 continues to improve upon the investments introduced in previous versions of Exchange as well as introduces additional technologies originally invented for use in Microsoft 365 and Office 365.

By aligning with the Preferred Architecture you will take advantage of these changes and provide the best on-premises user experience possible. You will continue the tradition of having a highly reliable, predictable, and resilient Exchange deployment.

Exchange Server permissions

8/3/2020 • 12 minutes to read • Edit Online

Microsoft Exchange Server includes a large set of predefined permissions, based on the Role Based Access Control (RBAC) permissions model, which you can use right away to easily grant permissions to your administrators and users. You can use the permissions features in Exchange Server so that you can get your new organization up and running quickly.

Role-based permissions

In Exchange Server, the permissions that you grant to administrators and users are based on management roles. A role defines the set of tasks that an administrator or user can perform. For example, a management role called `Mail Recipients` defines the tasks that someone can perform on a set of mailboxes, contacts, and distribution groups. When a role is assigned to an administrator or user, that person is granted the permissions provided by the role.

There are two types of roles, administrative roles and end-user roles:

- **Administrative roles**: These roles contain permissions that can be assigned to administrators or specialist users using role groups that manage a part of the Exchange organization, such as recipients, servers, or databases.

- **End-user roles**: These roles, assigned using role assignment policies, enable users to manage aspects of their own mailbox and distribution groups that they own. End-user roles begin with the prefix `My`.

Roles give permissions to perform tasks to administrators and users by making cmdlets available to those who are assigned the roles. Because the Exchange admin center (EAC) and the Exchange Management Shell use cmdlets to manage Exchange, granting access to a cmdlet gives the administrator or user permission to perform the task in each of the Exchange management interfaces.

Role groups and role assignment policies

Roles grant permissions to perform tasks in Exchange Server, but you need an easy way to assign them to administrators and users. Exchange Server provides you with the following to help you do that:

- **Role groups**: Role groups enable you to grant permissions to administrators and specialist users.

- **Role assignment policies**: Role assignment policies enable you to grant permissions to end users to change settings on their own mailbox or distribution groups that they own.

For more information about role groups and role assignment policies, see the following sections.

Role groups

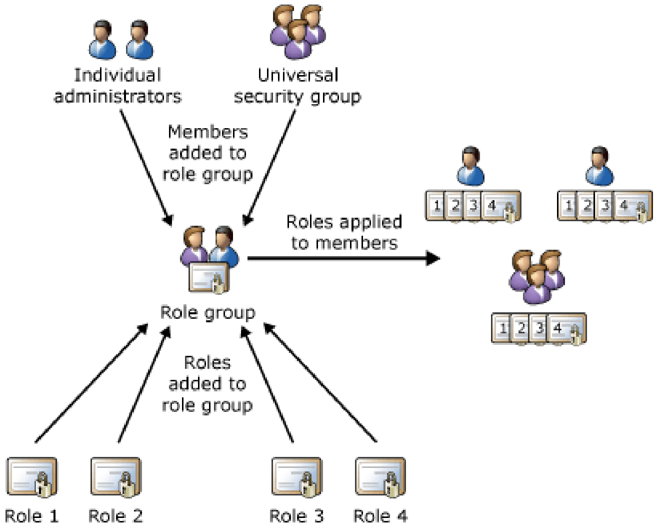
Every administrator that manages Exchange Server needs to be assigned at least one or more roles. Administrators might have more than one role because they may perform job functions that span multiple areas in Exchange. For example, one administrator might manage both recipients and Exchange servers. In this case, that administrator might be assigned both the `Mail Recipients` and `Exchange Servers` roles.

To make it easier to assign multiple roles to an administrator, Exchange Server includes role groups. Role groups are special universal security groups (USGs) used by Exchange Server that can contain Active Directory users, USGs, and other role groups. When a role is assigned to a role group, the permissions granted by the role are granted to all the members of the role group. This enables you to assign many roles to many role group members at once. Role groups typically encompass broader management areas, such as recipient management. They're used only with administrative roles, and not end-user roles.

> **NOTE**
>
> It's possible to assign a role directly to a user or USG without using a role group. However, that method of role assignment is an advanced procedure and isn't covered in this topic. We recommend that you use role groups to manage permissions.

The following figure shows the relationship between users, role groups, and roles.

Roles, role groups, and role group members



Exchange Server includes several built-in role groups, each one providing permissions to manage specific areas in Exchange Server. Some role groups may overlap with others. The following table lists each role group with a description of its use. If you want to see the roles assigned to each role group, click the name of the role group in the "Role group" column, and then open the "Management Roles Assigned to This Role Group" section.

> **IMPORTANT**
>
> If an administrator is a member of more than one role group, Exchange Server grants the administrator all of the permissions provided by the role groups he or she is a member of.

Built-in role groups

ROLE GROUP	DESCRIPTION
Organization Management	Administrators who are members of the Organization Management role group have administrative access to the entire Exchange Server organization and can perform almost any task against any Exchange Server object, with some exceptions, such as the `Discovery Management` role. **Important**: Because the Organization Management role group is a powerful role, only users or USGs that perform organizational-level administrative tasks that can potentially impact the entire Exchange organization should be members of this role group.
View-Only Organization Management	Administrators who are members of the View Only Organization Management role group can view the properties of any object in the Exchange organization.

ROLE GROUP	DESCRIPTION
Recipient Management	Administrators who are members of the Recipient Management role group have administrative access to create or modify Exchange Server recipients within the Exchange Server organization.
UM Management	Administrators who are members of the UM Management role group can manage features in the Exchange organization such as Unified Messaging (UM) service configuration, UM properties on mailboxes, UM prompts, and UM auto attendant configuration. (**Note**: UM is not available on Exchange 2019.)
Help Desk	The Help Desk role group, by default, enables members to view and modify the Outlook on the web (formerly known as Outlook Web App) options of any user in the organization. These options might include modifying the user's display name, address, and phone number. They don't include options that aren't available in Outlook on the web options, such as modifying the size of a mailbox or configuring the mailbox database on which a mailbox is located.
Hygiene Management	Administrators who are members of the Hygiene Management role group can configure the antivirus and antispam features of Exchange Server. Third-party programs that integrate with Exchange Server can add service accounts to this role group to grant those programs access to the cmdlets required to retrieve and configure the Exchange configuration.
Records Management	Users who are members of the Records Management role group can configure compliance features, such as retention policy tags, message classifications, and mail flow rules (also known as transport rules).
Discovery Management	Administrators or users who are members of the Discovery Management role group can perform searches of mailboxes in the Exchange organization for data that meets specific criteria and can also configure legal holds on mailboxes.
Public Folder Management	Administrators who are members of the Public Folder Management role group can manage public folders on servers running Exchange Server.
Server Management	Administrators who are members of the Server Management role group can configure server-specific configuration of transport, Unified Messaging, client access, and mailbox features such as database copies, certificates, transport queues and Send connectors, virtual directories, and client access protocols. (**Note**: UM is not available on Exchange 2019.)
Delegated Setup	Administrators who are members of the Delegated Setup role group can deploy servers running Exchange Server that have been previously provisioned by a member of the Organization Management role group.

ROLE GROUP	DESCRIPTION
Compliance Management	Users who are members of the Compliance Management role group can configure and manage Exchange compliance settings in accordance with their organization's policy.

If you work in a small organization that has only a few administrators, you might only ever use the Organization Management role group, and none of the others. If you work in a larger organization, you might have administrators who perform specific tasks administering Exchange, such as recipient or server management. In those cases, you might add one administrator to the Recipient Management role group, and another administrator to the Server Management role group. Those administrators can then manage their specific areas of Exchange Server but won't have permissions to manage areas they're not responsible for.

If you can't find a built-in role group that fits the jobs your administrators need to do, you can create role groups and add roles to them. For more information, see Work with role groups later in this topic.

Role assignment policies

Exchange Server provides role assignment policies so that you can control what settings your users can configure on their own mailboxes and on distribution groups they own. These settings include their display name, contact information, voice mail settings, and distribution group membership.

Your Exchange Server organization can have multiple role assignment policies that provide different levels of permissions for the different types of users in your organizations. Some users can be allowed to change their address or create distribution groups, while others can't. It all depends on the role assignment policy associated with their mailbox. Role assignment policies are added directly to mailboxes, and each mailbox can only be associated with one role assignment policy at a time.

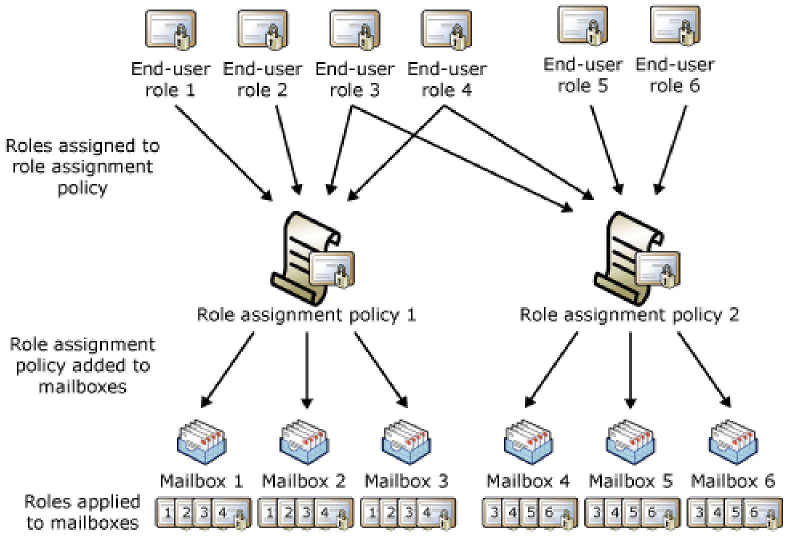
Of the role assignment policies in your organization, one is marked as default. The default role assignment policy is associated with new mailboxes that aren't explicitly assigned a specific role assignment policy when they're created. The default role assignment policy should contain the permissions that should be applied to the majority of your mailboxes.

Permissions are added to role assignment policies using end-user roles. End-user roles begin with `My` and grant permissions for users to manage only their mailbox or distribution groups they own. They can't be used to manage any other mailbox. Only end-user roles can be assigned to role assignment policies.

When an end-user role is assigned to a role assignment policy, all of the mailboxes associated with that role assignment policy receive the permissions granted by the role. This enables you to add or remove permissions to sets of users without having to configure individual mailboxes. The following figure shows:

- End-user roles are assigned to role assignment policies. Role assignment policies can share the same end-user roles.
- Role assignment policies are associated with mailboxes. Each mailbox can only be associated with one role assignment policy.
- After a mailbox is associated with a role assignment policy, the end-user roles are applied to that mailbox. The permissions granted by the roles are granted to the user of the mailbox.

Roles, role assignment policies, and mailboxes

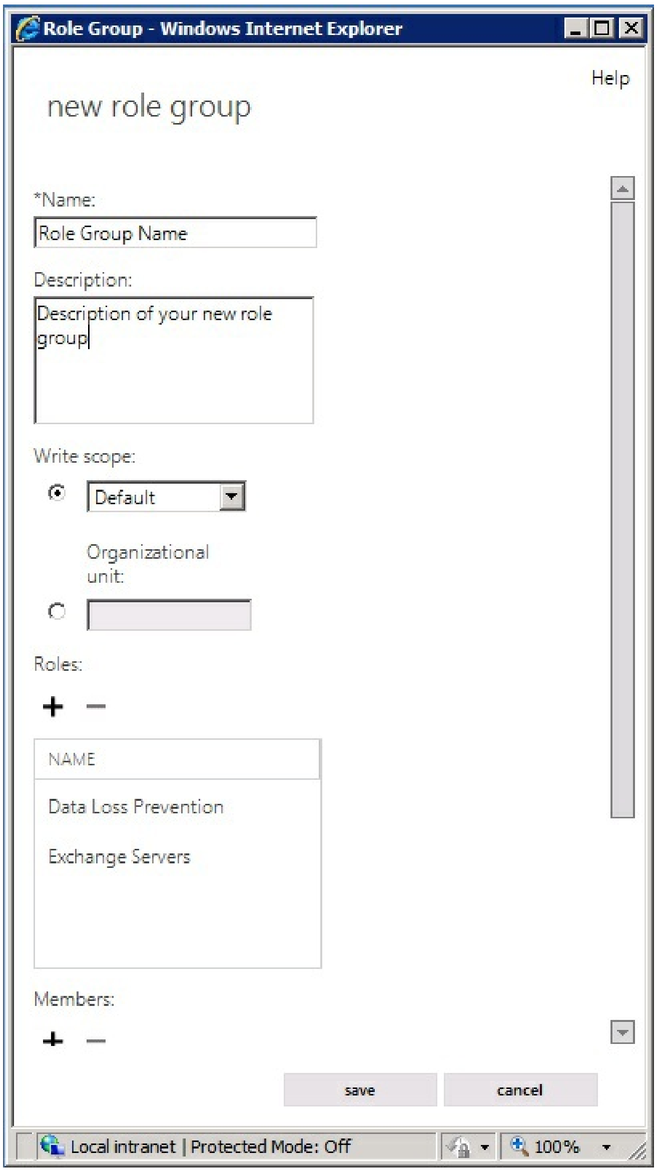


The Default Role Assignment Policy role assignment policy is included with Exchange Server. As the name implies, it's the default role assignment policy. If you want to change the permissions provided by this role assignment policy, or if you want to create role assignment policies, see Work with role assignment policies later in this topic.

Work with role groups

To manage your permissions using role groups in Exchange Server, we recommend that you use the Exchange admin center (EAC). When you use the EAC to manage role groups, you can add and remove roles and members, create role groups, and copy role groups with a few clicks of your mouse. The EAC provides simple dialog boxes, such as the **new role group** dialog box, shown in the following figure, to perform these tasks.

New role group dialog box in the EAC



Role Group - Windows Internet Explorer
Help
save
cancel
Local intranet | Protected Mode: Off
100%

new role group

*Name: Role Group Name

Description: Description of your new role group

Write scope:

● Default

○ Organizational unit:

Roles:

NAME
Data Loss Prevention
Exchange Servers

Members:

If none of the role groups included with Exchange Server have the permissions you need, you can use the EAC to create a role group and add the roles that have the permissions you need. For your new role group, you'll need to:

1. Choose a name for your role group.

2. Select the roles you want to add to the role group.

3. Add members to the role group.

4. Save the role group.

After you create the role group, you manage it like any other role group.

If there's an existing role group that has some, but not all, of the permissions you need, you can copy it and then make changes to create a role group. Copying an existing role group lets you make changes to it without affecting the original role group. As part of copying the role group, you can add a new name and description, add and remove roles to and from the new role group, and add new members. When you create or copy a role group, you use the same dialog box that's shown in the preceding figure.

Existing role groups can also be modified. You can add and remove roles from existing role groups, and add and remove members from it at the same time, using an EAC dialog box similar to the one in the preceding figure. By adding and removing roles to and from role groups, you turn on and off administrative features for members of that role group.

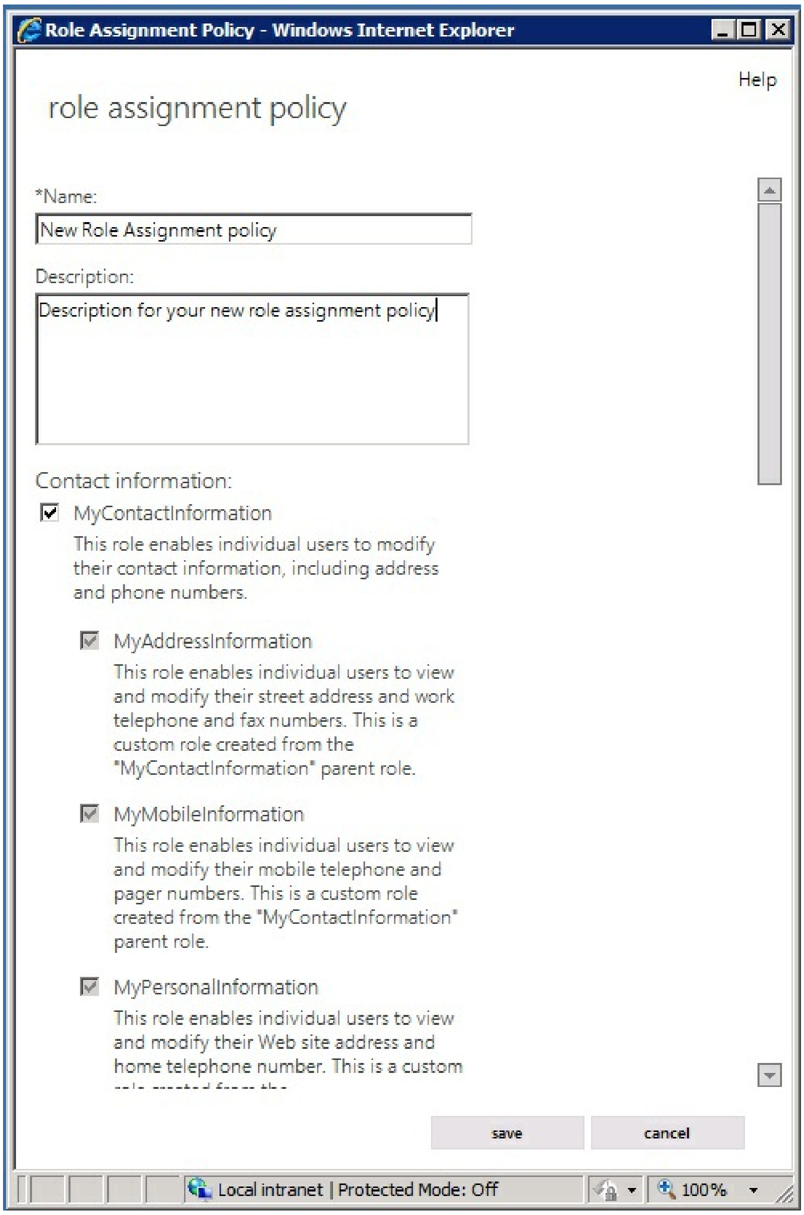
NOTE

Although you can change which roles are assigned to built-in role groups, we recommend that you copy built-in role groups, modify the role group copy, and then add members to the role group copy.

Work with role assignment policies

To manage the permissions that you grant end users to manage their own mailbox in Exchange Server, we recommend that you use the EAC. When you use the EAC to manage end-user permissions, you can add roles, remove roles, and create role assignment policies with a few clicks of your mouse. The EAC provides simple dialog boxes, such as the **role assignment policy** dialog box, shown in the following figure, to perform these tasks.

Role assignment policy dialog box in the EAC



Role Assignment Policy - Windows Internet Explorer

save
cancel
Local intranet | Protected Mode: Off
100%

role assignment policy

*Name:

New Role Assignment policy

Description:

Description for your new role assignment policy

Contact information:

☑ MyContactInformation

This role enables individual users to modify their contact information, including address and phone numbers.

☑ MyAddressInformation

This role enables individual users to view and modify their street address and work telephone and fax numbers. This is a custom role created from the "MyContactInformation" parent role.

☑ MyMobileInformation

This role enables individual users to view and modify their mobile telephone and pager numbers. This is a custom role created from the "MyContactInformation" parent role.

☑ MyPersonalInformation

This role enables individual users to view and modify their Web site address and home telephone number. This is a custom role created from the

Exchange Server includes a role assignment policy named Default Role Assignment Policy. This role assignment policy enables users whose mailboxes are associated with it to do the following:

- Join or leave distribution groups that allow members to manage their own membership.
- View and modify basic mailbox settings on their own mailbox, such as Inbox rules, spelling behavior, junk mail settings, and Microsoft ActiveSync devices.
- Modify their contact information, such as work address and phone number, mobile phone number, and

pager number.

- Create, modify, or view text message settings.
- View or modify voice mail settings.
- View and modify their marketplace apps.
- Create team mailboxes and connect them to Microsoft SharePoint lists.

If you want to add or remove permissions from the Default Role Assignment Policy or any other role assignment policy, you can use the EAC. When you open the role assignment policy in the EAC, select the check box next to the roles you want to assign to it or clear the check box next to the roles you want to remove. The change you make to the role assignment policy is applied to every mailbox associated with it.

If you want to assign different end-user permissions to the various types of users in your organization, you can create role assignment policies. You can specify a new name for the role assignment policy, and then select the roles you want to assign to the role assignment policy. After you create a role assignment policy, you can associate it with mailboxes using the EAC.

If you want to change which role assignment policy is the default, you needs to use the Exchange Management Shell. When you change the default role assignment policy, any mailboxes that are created will be associated with the new default role assignment policy if one wasn't explicitly specified. The role assignment policy associated with existing mailboxes doesn't change when you select a new default role assignment policy.

Notes:

- If you select a check box for a role that has child roles, the check boxes for the child roles are also selected. If you clear the check box for a role with child roles, the check boxes for the child roles are also cleared.
- For detailed steps about how to create role assignment policies or make changes to existing role assignment policies, see the following topics:
  - Manage role assignment policies
  - Change the assignment policy on a mailbox

Manage role groups

8/3/2020 • 24 minutes to read • Edit Online

A management role group is a universal security group (USG) used in the Role Based Access Control (RBAC) permissions model in Exchange Server. A management role group simplifies the assignment of management roles to a group of users. All members of a role group are assigned the same set of roles. For more information about role groups in Exchange Server, see Understanding Management Role Groups.

For additional management tasks related to role groups, see Permissions.

What do you need to know before you begin?

- Estimated time to complete each procedure: 5 to 10 minutes
- To open the EAC, see Exchange admin center in Exchange Server. To open the Exchange Management Shell, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Role groups" entry in the Role management permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Create a role group

If you want to customize the permissions that you can assign to a group of users, create a new custom management role group.

Use the EAC to create a role group

1. In the Exchange admin center (EAC), navigate to **Permissions** > **Admin Roles** and then click **Add** +.
2. In the **New role group** window, provide a name for the new role group.
3. You can either select the roles that you want to be assigned to the role group and the members you want to be added to the role group now, or you can do this at another time.
4. Select the write scope that you want to apply to the new role group.
5. Click **Save** to create the role group.

Use the Exchange Management Shell to create a role group

To create a role group, see the Examples section in New-RoleGroup.

How do you know this worked?

To verify that you have successfully created a role group, do the following:

1. In the EAC, navigate to **Permissions** > **Admin Roles**.

2. Verify that the new role group appears in the role group list and then select it.

3. Verify that members, assigned roles, and scope that you specified on the new role group are listed in the role group details pane.

Copy a role group

Use the EAC to copy a role group

If you have a role group that contains the permissions you want to grant to users, but you want to apply a different management scope, or remove or add one or two management roles without having to add all the other roles manually, you can copy the existing role group.

> **IMPORTANT**
>
> You can't use the EAC to copy a role group if you've used the Exchange Management Shell to configure multiple management role scopes or exclusive scopes on the role group. If you've configured multiple scopes or exclusive scopes on the role group, you must use the Exchange Management Shell procedures later in this topic to copy the role group. For more information about management role scopes, see Understanding Management Role Scopes.

1. In the EAC, navigate to **Permissions** > **Admin Roles**.

2. Select the role group you want to copy and then click **Copy**.

3. In the **New role group** window, provide a name for the new role group.

4. Review the roles that have been copied to the new role group. Add or remove roles as necessary.

5. Review the write scope, and change it as necessary.

6. Review the members that have been copied to the new role group. Add or remove members as necessary.

7. Click **Save** to create the role group.

Use the Exchange Management Shell to copy a role group with no scope

1. Store the role group that you want to copy in a variable using the following syntax.

   ```
   $RoleGroup = Get-RoleGroup <name of role group to copy>
   ```

2. Create the new role group, and also add members to the role group and specify who can delegate the new role group to other users, using the following syntax.

   ```
   New-RoleGroup <name of new role group> -Roles $RoleGroup.Roles -Members <member1, member2, member3...>
   -ManagedBy <user1, user2, user3...>
   ```

   For example, the following commands copy the Organization Management role group, and name the new role group "Limited Organization Management". It adds the members Isabelle, Carter, and Lukas and can be delegated by Jenny and Katie.

   ```
   $RoleGroup = Get-RoleGroup "Organization Management"
   New-RoleGroup "Limited Organization Management" -Roles $RoleGroup.Roles -Members Isabelle, Carter,
   Lukas -ManagedBy Jenny, Katie
   ```

After the new role group is created, you can add or remove roles, change the scope of role assignments on the role, and more.

For detailed syntax and parameter information, see Get-RoleGroup and New-RoleGroup.

Use the Exchange Management Shell to copy a role group with a custom scope

1. Store the role group that you want to copy in a variable using the following syntax.

   ```
   $RoleGroup = Get-RoleGroup <name of role group to copy>
   ```

2. Create the new role group with a custom scope using the following syntax.

   ```
   New-RoleGroup <name of new role group> -Roles $RoleGroup.Roles -CustomRecipientWriteScope <recipient
   scope name> -CustomConfigWriteScope <configuraiton scope name>
   ```

For example, the following commands copy the Organization Management role group and create a new role group called Vancouver Organization Management with the Vancouver Users recipient scope and Vancouver Servers configuration scope.

```
$RoleGroup = Get-RoleGroup "Organization Management"
New-RoleGroup "Vancouver Organization Management" -Roles $RoleGroup.Roles -CustomRecipientWriteScope
"Vancouver Users" -CustomConfigWriteScope "Vancouver Servers"
```

You can also add members to the role group when you create it by using the *Members* parameter as shown in Use the Exchange Management Shell to create a role assignment with no scope earlier in this topic. For more information about management scopes, see Understanding Management Scopes.

After the new role group is created, you can add or remove roles, change the scope of role assignments on the role, and perform other tasks.

For detailed syntax and parameter information, see Get-RoleGroup and New-RoleGroup.

Use the Exchange Management Shell to copy a role group with an OU scope

1. Store the role group that you want to copy in a variable using the following syntax.

   ```
   $RoleGroup = Get-RoleGroup <name of role group to copy>
   ```

2. Create the new role group with a custom scope using the following syntax.

   ```
   New-RoleGroup <name of new role group> -Roles $RoleGroup.Roles -RecipientOrganizationalUnitScope <OU
   name>
   ```

For example, the following commands copy the Recipient Management role group and create a new role group called Toronto Recipient Management that allows management of only users in the Toronto Users OU.

```
$RoleGroup = Get-RoleGroup "Recipient Management"
New-RoleGroup "Toronto Recipient Management" -Roles $RoleGroup.Roles -RecipientOrganizationalUnitScope
"contoso.com/Toronto Users"
```

You can also add members to the role group when you create it by using the *Members* parameter as shown in Use the Exchange Management Shell to create a role assignment with no scope earlier in this topic. For more information about management scopes, see Understanding Management Scopes.

After the new role group is created, you can add or remove roles, change the scope of role assignments on the role, and more.

For detailed syntax and parameter information, see Get-RoleGroup and New-RoleGroup.

How do you know this worked?

To verify that you have successfully copied a role group, do the following:

1. In the EAC, navigate to **Permissions** > **Admin Roles**.

2. Verify that the copied role group appears in the role group list, and then select it.

3. Verify that members, assigned roles, and scope that you specified on the copied role group are listed in the role group details pane.

Remove a role group

If you no longer need a role group you created, you can remove it. When you remove a role group, the management role assignments between the role group and the management roles are deleted. The management roles aren't deleted. If a user depended on the role group for access to a feature, the user will no longer have access to the feature. You can't remove built-in role groups.

Use the EAC to remove a role group

1. In the EAC, navigate to **Permissions** > **Admin Roles**.

2. Select the role group you want to remove and then click **Delete** 🗑.

3. Verify that you want to remove the selected role group, and if so, respond **Yes** to the warning.

Use the Exchange Management Shell to remove a role group

To remove a role group, see the Examples section in Remove-RoleGroup.

View role groups

You can view either a list of role groups or the detailed information about a specific role group that exists in your organization.

Use the EAC to view a list of role groups and role group details

1. In the EAC, navigate to **Permissions** > **Admin Roles**. All of the role groups in your organization are listed here.

2. Select a role group to view the members, assigned roles, and scope that are configured on the role group.

Use the Exchange Management Shell to view a list of role groups and role group details

To view a list of role groups, see the Examples section in Get-RoleGroup.

Add a role to a role group

Adding a management role to a role group is the best and simplest way to grant permissions to a group of administrators or specialist users. If you want to give users that are members of a role group the ability to manage a feature, you add the management role that manages the feature to the role group. After the role is added, the members of the role group are granted the permissions provided by the role.

Use the EAC to add a management role to a role group

> **IMPORTANT**
>
> You can't use the EAC to add roles to a role group if you've used the Exchange Management Shell to configure multiple management role scopes or exclusive scopes on the role group. If you've configured multiple scopes or exclusive scopes on the role group, you must use the Exchange Management Shell procedures later in this topic to add roles to the role group. For more information about management role scopes, see Understanding Management Role Scopes.

1. In the EAC, navigate to **Permissions** > **Admin Roles**.

2. Select the role group you want to add a role to, and then click **Edit** ✎.

3. In the **Roles** section, select the roles you want to add to the role group.

4. When you've finished adding roles to the role group, click **Save**.

Use the Exchange Management Shell to create a role assignment with no scope

You can create a role assignment with no scope between a role and a role group. When you do this, the implicit read and implicit write scopes of the role apply.

Use the following syntax to assign a role without any scope to a role group. A role assignment name is created automatically if you don't specify one.

```
New-ManagementRoleAssignment -SecurityGroup <role group name> -Role <role name>
```

This example assigns the Transport Rules management role to the Seattle Compliance role group.

```
New-ManagementRoleAssignment -SecurityGroup "Seattle Compliance" -Role "Transport Rules"
```

For detailed syntax and parameter information, see New-ManagementRoleAssignment.

Use the Exchange Management Shell to create a role assignment with a predefined scope

If a predefined scope meets your business requirements, you can apply that scope to the role assignment rather than create a new one. For a list of predefined scopes and their descriptions, see Understanding Management Role Scopes.

For more information about role assignments, see Understanding Management Role Assignments.

Use the following syntax to assign a role to a role group with a predefined scope. A role assignment name is created automatically if you don't specify one.

```
New-ManagementRoleAssignment -SecurityGroup <role group name> -Role <role name> -RecipientRelativeWriteScope <
MyGAL | MyDistributionGroups | Organization | Self >
```

This example assigns the Message Tracking role to the Enterprise Support role group and applies the Organization predefined scope.

```
New-ManagementRoleAssignment -SecurityGroup "Enterprise Support" -Role "Message Tracking" -
RecipientRelativeWriteScope Organization
```

For detailed syntax and parameter information, see New-ManagementRoleAssignment.

Use the Exchange Management Shell to create a role assignment with a recipient filter-based scope

If you created a recipient filter-based scope, you need to include the scope in the command used to assign the role to a role group by using the *CustomRecipientWriteScope* parameter.

You can also include a configuration write scope when you create a role assignment that has a recipient write scope.

For more information about role assignments and scopes, see the following topics:

- Understanding Management Role Assignments
- Understanding Management Role Scopes

Use the following syntax to assign a role to a role group with a recipient filter-based scope. A role assignment name is created automatically if you don't specify one.

```
New-ManagementRoleAssignment -SecurityGroup <role group name> -Role <role name> -CustomRecipientWriteScope
<role scope name>
```

This example assigns the Message Tracking role to the Seattle Recipient Admins role group and applies the Seattle Recipients scope.

```
New-ManagementRoleAssignment -SecurityGroup "Seattle Recipient Admins" -Role "Message Tracking" -
CustomRecipientWriteScope "Seattle Recipients"
```

For detailed syntax and parameter information, see New-ManagementRoleAssignment.

Use the Exchange Management Shell to create a role assignment with a configuration scope

If you created a server or database configuration filter or list-based scope, you need to include the scope in the command used to assign the role to a role group by using the *CustomConfigWriteScope* parameter.

You can also include a recipient write scope when you create a role assignment that has a configuration write scope.

For more information about role assignments and management scopes, see the following topics:

- Understanding Management Role Assignments
- Understanding Management Role Scopes

Use the following syntax to assign a role to a role group with a configuration scope. A role assignment name is created automatically if you don't specify one.

```
New-ManagementRoleAssignment -SecurityGroup <role group name> -Role <role name> -CustomConfigWriteScope <role
scope name>
```

This example assigns the Databases role to the Seattle Server Admins role group and applies the Seattle Servers scope.

```
New-ManagementRoleAssignment -SecurityGroup "Seattle Server Admins" -Role "Databases" -CustomConfigWriteScope
"Seattle Servers"
```

For detailed syntax and parameter information, see New-ManagementRoleAssignment.

Use the Exchange Management Shell to create a role assignment with an OU scope

If you want to scope a role's write scope to an OU, you can specify the OU in the *RecipientOrganizationalUnitScope* parameter directly.

For more information about role assignments and management scopes, see the following topics:

- Understanding Management Role Assignments
- Understanding Management Role Scopes

Use the following command to assign a role to a role group and restrict the write scope of a role to a specific OU. A role assignment name is created automatically if you don't specify one.

```
New-ManagementRoleAssignment -SecurityGroup <role group name> -Role <role name> -
RecipientOrganizationalUnitScope <OU>
```

This example assigns the Mail Recipients role to the Seattle Recipient Admins role group and scopes the assignment to the Sales\Users OU in the Contoso.com domain.

```
New-ManagementRoleAssignment -SecurityGroup "Seattle Recipient Admins" -Role "Mail Recipients" -
RecipientOrganizationalUnitScope contoso.com/sales/users
```

For detailed syntax and parameter information, see New-ManagementRoleAssignment.

How do you know this worked?

To verify that you have successfully added roles to a role group, do the following:

1. In the EAC, navigate to **Permissions** > **Admin Roles**.
2. Select the role group you added roles to. In the role group details pane, verify that the roles that you added are listed.

Remove a role from a role group

Removing a role from a management role group is the best and simplest way to revoke permissions granted to a group of administrators or specialist users. If you don't want administrators or specialist users to have permissions to manage a feature, you remove the management role from the management role group that manages the permissions. After the role is removed, the members of the role group will no longer have permissions to manage the feature.

> **NOTE**
>
> Some role groups, such as the Organization Management role group, restrict what roles can be removed from a role group. For more information, see Understanding Management Role Groups. > If an administrator is a member of another role group that contains management roles that grants permissions to manage the feature, you need to either remove the administrator from the other role groups, or remove the role that grants permissions to manage the feature from the other role groups.

Use the EAC to remove a management role from a role group

> **IMPORTANT**
>
> You can't use the EAC to remove roles from a role group if you've used the Exchange Management Shell to configure multiple scopes or exclusive scopes on the role group. If you've configured multiple scopes or exclusive scopes on the role group, you must use the Exchange Management Shell procedures later in this topic to remove roles from the role group. For more information about management role scopes, see Understanding Management Role Scopes.

1. In the EAC, navigate to **Permissions** > **Admin Roles**.
2. Select the role group you want to remove a role from, and then click **Edit** ✏.

3. In the **Roles** section, select the roles you want to remove from the role group.

4. When you've finished removing roles from the role group, click **Save**.

Use the Exchange Management Shell to remove a role from a role group

You can remove roles from role groups by retrieving the associated management role assignment using the **Get-ManagementRoleAssignment** cmdlet and then piping the role assignment returned to the **Remove-ManagementRoleAssignment** cmdlet. Unless you want to remove both delegating and regular role assignments at the same time, specify the *Delegating* parameter to specify whether you want to remove regular or delegating role assignments.

For more information about regular and delegating role assignments, see Understanding Management Role Assignments.

This procedure uses pipelining. For more information about pipelining, see about_Pipelines.

To remove a role from a role group, use the following syntax.

```
Get-ManagementRoleAssignment -RoleAssignee <role group name> -Role <role name> -Delegating <$true | $false> |
Remove-ManagementRoleAssignment
```

This example removes the Distribution Groups role, which enables administrators to manage distribution groups, from the Seattle Recipient Administrators role group. Because we want to remove the role assignment that provides permissions to manage distribution groups, the *Delegating* parameter is set to `$False`, which returns only regular role assignments.

```
Get-ManagementRoleAssignment -RoleAssignee "Seattle Recipient Administrators" -Role "Distribution Groups" -
Delegating $false | Remove-ManagementRoleAssignment
```

For detailed syntax and parameter information, see Remove-ManagementRoleAssignment.

How do you know this worked?

To verify that you have successfully removed roles from a role group, do the following:

1. In the EAC, navigate to **Permissions** > **Admin Roles**.

2. Select the role group you removed roles from. In the role group details pane, verify that the roles that you removed are no longer listed.

Change a role group's scope

The management role assignments between a role group and a role contain management scopes, which determine what objects are made available to members of that role group. By changing the write scope on a role group, you can change what objects are made available to role group members to create, change, or remove. You can't change the read scope on a role group.

Exchange Server includes scopes that are applied by default to role assignments when no custom scopes are created. If you want to use a custom scope with a role assignment on a role group, you must create one first. For more information about creating custom scopes, which is an advanced task, see Create a Regular or Exclusive Scope.

For more information about management role scopes and assignments in Exchange Server, see the following topics:

- Understanding Management Role Scopes

- Understanding Management Role Assignments

Use the EAC to change the scope on a role group

When you use the EAC to change the scope on a role group, you're actually changing the scope on all the role assignments between the role group and each of the management roles assigned to the role group. If you want to change the scope on specific role assignments, you must use the Exchange Management Shell procedures later in this topic.

> **IMPORTANT**
>
> You can't use the EAC to manage scopes on role assignments between roles and a role group if you've used the Exchange Management Shell to configure multiple scopes or exclusive scopes on those role assignments. If you've configured multiple scopes or exclusive scopes on those role assignments, you must use the Exchange Management Shell procedures later in this topic to manage scopes. For more information about management role scopes, see Understanding Management Role Scopes.

1. In the EAC, navigate to **Permissions** > **Admin Roles**.
2. Select the role group you want to change the scope on, and then click **Edit** ✎.
3. Select one of the two following **Write scope** options:
   - A write scope from the drop-down box, where you can select either the default write scope or a custom write scope.
   - **Organizational unit**: Select this option and provide an organizational unit (OU) if you want to scope this role group to an OU.
4. Click **Save** to save the changes to the role group.

Use the Exchange Management Shell to change the scope of all role assignments on a role group at the same time

Role assignments between the role group and the roles assigned to it can use the implicit scope obtained from the roles themselves, the same custom scope, or different custom scopes. For more information about role assignments, see Understanding Management Role Assignments.

The scopes on the role assignments are managed using the **Set-ManagementRoleAssignment** cmdlet. You can't manage scopes using the **Set-RoleGroup** cmdlet.

To change the scope of all the role assignments between a role group and a set of management roles at the same time, you need to first retrieve the role assignments on the role group, and then set the new scope on each of the assignments. You can do this by using the **Get-ManagementRoleAssignment** cmdlet to retrieve the role assignments, and then pipe them to the **Set-ManagementRoleAssignment** cmdlet.

This procedure uses the concepts of pipelining and the *WhatIf* switch. For more information, see the following topics:

- about_Pipelines
- WhatIf, Confirm, and ValidateOnly Switches

To set the scope on all of the role assignments on a role group at the same time, use the following syntax.

```
Get-ManagementRoleAssignment -RoleAssignee <name of role group> | Set-ManagementRoleAssignment -
CustomRecipientWriteScope <recipient scope name> -CustomConfigWriteScope <configuration scope name> -
RecipientRelativeScopeWriteScope < MyDistributionGroups | Organization | Self> -ExclusiveRecipientWriteScope
<exclusive recipient scope name> -ExclusiveConfigWriteScope <exclusive configuration scope name> -
RecipientOrganizationalUnitScope <organizational unit>
```

You use only the parameters you need to configure the scope you want to use. For example, if you want to change the recipient scope for all role assignments on the Sales Recipient Management role group to Direct Sales Employees, use the following command.

```
Get-ManagementRoleAssignment -RoleAssignee "Sales Recipient Management" | Set-ManagementRoleAssignment -
CustomRecipientWriteScope "Direct Sales Employees"
```

> **NOTE**
>
> You can use the *WhatIf* switch to verify that only the role assignments you want to change are changed. Run the preceding command with the *WhatIf* switch to verify the results, and then remove the *WhatIf* switch to apply the changes.

For more information about changing management role assignments, see Change a Role Assignment.

For detailed syntax and parameter information, see Get-ManagementRoleAssignment.

Use the Exchange Management Shell to change the scope of individual role assignments on a role group

Role assignments between the role group and the roles assigned to it can use the implicit scope obtained from the roles themselves, the same custom scope, or different custom scopes. For more information about role assignments, see Understanding Management Role Assignments.

The scopes on the role assignments are managed using the **Set-ManagementRoleAssignment** cmdlet. You can't manage scopes using the **Set-RoleGroup** cmdlet.

This procedure uses the concepts of pipelining and the **Format-List** cmdlet. For more information, see the following topics:

- about_Pipelines
- Working with Command Output

To change the scope on a role assignment between a role group and a management role, you first find the name of the role assignment, and then set the scope on the role assignment.

1. To find the names of all the role assignments on a role group, use the following command. By piping the management role assignments to the **Format-List** cmdlet, you can view the full name of the assignment.

   ```
   Get-ManagementRoleAssignment -RoleAssignee <role group name> | Format-List Name
   ```

2. Find the name of the role assignment you want to change. Use the name of the role assignment in the next step.

3. To set the scope on an individual assignment, use the following syntax.

   ```
   Set-ManagementRoleAssignment <role assignment name> -CustomRecipientWriteScope <recipient scope name> -
   CustomConfigWriteScope <configuration scope name> -RecipientRelativeScopeWriteScope <
   MyDistributionGroups | Organization | Self> -ExclusiveRecipientWriteScope <exclusive recipient scope
   name> -ExclusiveConfigWriteScope <exclusive configuration scope name> -RecipientOrganizationalUnitScope
   <organizational unit>
   ```

You use only the parameters you need to configure the scope you want to use. For example, if you want to change the recipient scope for the Mail Recipients_Sales Recipient Management role assignment to All Sales Employees, use the following command.

```
Set-ManagementRoleAssignment "Mail Recipients_Sales Recipient Management" -CustomRecipientWriteScope "All
Sales Employees"
```

For more information about changing management role assignments, see Change a Role Assignment.

For detailed syntax and parameter information, see Set-ManagementRoleAssignment.

How do you know this worked?

To verify that you have successfully changed the scope of a role assignment on a role group, do the following:

- If you used the EAC to configure the scope on the role group, do the following:

  1. In the EAC, navigate to **Permissions** > **Admin Roles**. All the role groups in your organization are listed here.

  2. Select a role group to view the scope that's configured on the role group.

- If you used the Exchange Management Shell to configure the scope on the role group, do the following:

  1. Run the following command in the Exchange Management Shell.

     ```
     Get-ManagementRoleAssignment -RoleAssignee <role group name> | Format-Table *WriteScope
     ```

  2. Verify that the write scope on the role assignments has been changed to the scope you specified.

Add or remove a role group delegate

Role group delegates are users or universal security groups (USGs) that can add or remove members from a role group or change the properties of a role group. By adding or removing role group delegates, you can control who is allowed to manage a role group.

> **IMPORTANT**
>
> After you add a delegate to a role group, the role group can only be managed by the delegates on the role group, or by users who are assigned, either directly or indirectly, the Role Management management role. > If a user is assigned, either directly or indirectly, the Role Management role and isn't added as a delegate of the role group, the user must use the *BypassSecurityGroupManagerCheck* switch on the **Add-RoleGroupMember**, **Remove-RoleGroupMember**, **Update-RoleGroupMember**, and **Set-RoleGroup** cmdlets to manage a role group.

> **NOTE**
>
> You can't use the EAC to add a delegate to a role group.

Use the Exchange Management Shell to add a delegate to a role group

To change the list of delegates on a role group, you use the *ManagedBy* parameter on the **Set-RoleGroup** cmdlet. The *ManagedBy* parameter overwrites the entire delegate list on the role group. If you want to add delegates to the role group rather than replace the entire list of delegates, use the following steps:

1. Store the role group in a variable using the following command.

   ```
   $RoleGroup = Get-RoleGroup <role group name>
   ```

2. Add the delegate to the role group stored in the variable using the following command.

```
$RoleGroup.ManagedBy += (Get-User <user to add>).Identity
```

> **NOTE**
>
> Use the **Get-Group** cmdlet if you want to add a USG.

3. Repeat Step 2 for each delegate you want to add.

4. Apply the new list of delegates to the actual role group using the following command.

```
Set-RoleGroup <role group name> -ManagedBy $RoleGroup.ManagedBy
```

This example adds the user David Strome as a delegate on the Organization Management role group.

```
$RoleGroup = Get-RoleGroup "Organization Management"
$RoleGroup.ManagedBy += (Get-User "David Strome").Identity
Set-RoleGroup "Organization Management" -ManagedBy $RoleGroup.ManagedBy
```

For detailed syntax and parameter information, see Set-RoleGroup.

Use the Exchange Management Shell to remove a delegate from a role group

To change the list of delegates on a role group, you use the *ManagedBy* parameter on the **Set-RoleGroup** cmdlet. The *ManagedBy* parameter overwrites the entire delegate list on the role group. If you want to remove delegates from the role group rather than replace the entire list of delegates, use the following steps:

1. Store the role group in a variable using the following command.

```
$RoleGroup = Get-RoleGroup <role group name>
```

2. Remove the delegate from the role group stored in the variable using the following command.

```
$RoleGroup.ManagedBy -= (Get-User <user to remove>).Identity
```

> **NOTE**
>
> Use the **Get-Group** cmdlet if you want to remove a USG.

3. Repeat Step 2 for each delegate you want to remove.

4. Apply the new list of delegates to the actual role group using the following command.

```
Set-RoleGroup <role group name> -ManagedBy $RoleGroup.ManagedBy
```

This example removes the user David Strome as a delegate on the Organization Management role group.

```
$RoleGroup = Get-RoleGroup "Organization Management"
$RoleGroup.ManagedBy -= (Get-User "David Strome").Identity
Set-RoleGroup "Organization Management" -ManagedBy $RoleGroup.ManagedBy
```

For detailed syntax and parameter information, see Set-RoleGroup.

How do you know this worked?

To verify that you have successfully changed the delegate list on a role group, do the following:

1. In the Exchange Management Shell, run the following command.

   ```
   Get-RoleGroup <role group name> | Format-List ManagedBy
   ```

2. Verify that the delegates listed on the *ManagedBy* property include only the delegates that should be able to manage the role group.

Manage role group members

8/3/2020 • 3 minutes to read • Edit Online

To learn about role groups in Exchange Server, see Understanding Management Role Groups.

For additional management tasks related to role groups, see Permissions.

What do you need to know before you begin?

- Estimated time to complete each procedure: 5 minutes
- To open the EAC, see Exchange admin center in Exchange Server. To open the Exchange Management Shell, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Role groups" entry in the Role management permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Add members to a role group

To give a user the permissions that are granted by a role group, you need to add the user, or a universal security group (USG), or another role group that the user is a member of, as a member of the role group.

Use the EAC to add members to a role group

1. In the Exchange admin center (EAC), navigate to **Permissions** > **Admin Roles**.
2. Select the role group you want to add members to, and then click **Edit** ✏.
3. In the **Members** section, click **Add** +.
4. Select the users, USGs, or other role groups you want to add to the role group, click **Add**, and then click **OK**.
5. Click **Save** to save the changes to the role group.

Use the Exchange Management Shell to add members to a role group

To add a role group member, see the Examples section in Add-RoleGroupMember.

To add multiple role group members or to replace the role group membership entirely, see the Examples section in Update-RoleGroupMember.

How do you know this worked?

To verify that you have successfully added one or more members to a role group, do the following:

1. In the EAC, navigate to **Permissions** > **Admin Roles**.
2. Select the role group you added members to.

3. In the role group details pane, verify that the members you added are listed.

Remove members from a role group

To remove the permissions granted by a role group from a user, you need to remove the user, or the universal security group (USG) the user is a member of, from the role group's membership.

Use the EAC to remove members from a role group

1. In the EAC, navigate to **Permissions** > **Admin Roles**.

2. Select the role group you want to remove members from, and then click **Edit** ✎.

3. In the **Members** section, select the members you want to remove, click **Remove** −, and then click **Save**.

Use the Exchange Management Shell to remove members from a role group

To remove a role group member, see the Examples section in Remove-RoleGroupMember.

To remove multiple role group members or to replace the role group membership entirely, see the Examples section in Update-RoleGroupMember.

How do you know this worked?

To verify that you have successfully removed one or more members to a role group, do the following:

1. In the EAC, navigate to **Permissions** > **Admin Roles**.

2. Select the role group you removed members from.

3. In the role group details pane, verify that the members you removed are no longer listed.

View the members of a role group

The members of a role group are granted the permissions provided by the management roles assigned to the role group. You can view the members of a role group to see which users, universal security groups (USG), or other role groups are granted permissions by the role group you specify.

Use the EAC to view the members of a role group

1. In the EAC, navigate to **Permissions** > **Admin Roles**.

2. Select the role group you want to view the members of.

3. In the role group details pane, view the members in the role group details pane.

Use the Exchange Management Shell to view the members of a role group

To view the members of a role group, see the "Examples" section in Get-RoleGroupMember.

Manage role assignment policies

8/3/2020 • 9 minutes to read • Edit Online

If you want to customize the permissions that you assign to a group of end users, create a new custom management role assignment policy. The assignment policy you create can be customized to suit your end user's specific requirements. For more information about assignment policies in Exchange Server, see Understanding Management Role Assignment Policies.

Looking for other management tasks related to managing permissions? Check out Permissions.

What do you need to know before you begin?

- Estimated time to complete each procedure: 5 minutes
- To open the EAC, see Exchange admin center in Exchange Server. To open the Exchange Management Shell, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Assignment policies" entry in the Role management permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Add an assignment policy

After you've created the new assignment policy, you assign users to it. For more information, see Change the assignment policy on a mailbox.

Use the EAC to create a new assignment policy

> **NOTE**
>
> You can only create explicit assignment policies using the Exchange admin center (EAC). If you want to create a new default assignment policy, you must use the Exchange Management Shell. For more information, see the "Use the Exchange Management Shell to create a default assignment policy" section later in this topic.

1. In the EAC, navigate to **Permissions** > **User Roles** and then click **Add** ＋.
2. In the role assignment policy window, provide a name for the new assignment policy.
3. Select the check box next to the role or roles you want to add to the assignment policy. You can select multiple roles, including end-user roles you've added. If you select a role that has child roles, the child roles are automatically selected.
4. Click **Save** to save the changes to the assignment policy.

Use the Exchange Management Shell to create an explicit assignment policy

To create an explicit assignment policy that can be manually assigned to mailboxes, use the following syntax.

```
New-RoleAssignmentPolicy <assignment policy name> -Roles <roles to assign>
```

This example creates the explicit assignment policy Limited Mailbox Configuration and assigns the `MyBaseOptions`, `MyAddressInformation`, and `MyDisplayName` roles to it.

```
New-RoleAssignmentPolicy "Limited Mailbox Configuration" -Roles MyBaseOptions, MyAddressInformation,
MyDisplayName
```

For detailed syntax and parameter information, see New-RoleAssignmentPolicy.

Use the Exchange Management Shell to create a default assignment policy

To create a default assignment policy assigned to new mailboxes, use the following syntax.

```
New-RoleAssignmentPolicy <assignment policy name> -Roles <roles to assign> -IsDefault
```

This example creates the default assignment policy Limited Mailbox Configuration and assigns the `MyBaseOptions`, `MyAddressInformation`, and `MyDisplayName` roles to it.

```
New-RoleAssignmentPolicy "Limited Mailbox Configuration" -Roles MyBaseOptions, MyAddressInformation,
MyDisplayName -IsDefault
```

For detailed syntax and parameter information, see New-RoleAssignmentPolicy.

Remove an assignment policy

If you no longer need a management role assignment policy, you can remove it.

What do you need to know before you begin?

- All users assigned the assignment policy must be changed to another assignment policy. For more information about how to change an assignment policy on a mailbox, see Change the assignment policy on a mailbox.

- All the management role assignments between the assignment policy and the assigned management roles must be removed. For more information about how to remove a role assignment from an assignment policy, see the Remove a role from an assignment policy section later in this topic.

- If you want to remove a default assignment policy, it must be the last assignment policy in the Exchange Server organization.

Use the EAC to remove an assignment policy

1. In the EAC, navigate to **Permissions** > **User Roles**.

2. Select the assignment policy you want to remove, and then click **Delete** 🗑.

Use the Exchange Management Shell to remove an assignment policy

To remove an assignment policy, use the following syntax.

```
Remove-RoleAssignmentPolicy <role assignment policy>
```

This example removes the New York Temporary Users assignment policy.

```
Remove-RoleAssignmentPolicy "New York Temporary Users"
```

For detailed syntax and parameter information, see Remove-RoleAssignmentPolicy.

View a list of assignment policies or assignment policy details

You can view management role assignment policies in a variety of ways, depending on the information you want and whether you're using the EAC or the Exchange Management Shell.

In the EAC, you can view the list of assignment policies and the roles assigned to them. In the Exchange Management Shell, you can view all the assignment policies in your organization, list the mailboxes assigned a specific policy, and more.

Use the EAC to view a list of assignment policies

1. In the EAC, navigate to **Permissions** > **User Roles**. All of the assignment policies in the organization are listed here.

2. To view the details of a specific assignment policy, select the assignment policy you want to view. The description and the roles assigned to the assignment policy are displayed in the details pane.

Use the Exchange Management Shell to view a list of assignment policies

You can view a list of all the assignment policies in your organization by not specifying any assignment policies when you run the **Get-RoleAssignmentPolicy** cmdlet.

This procedure makes use of pipelining and the **Format-Table** cmdlet. For more information about these concepts, see the following topics:

- about_Pipelines

- Working with Command Output

To return a list of all assignment policies in your organization, use the following command.

```
Get-RoleAssignmentPolicy
```

To return a list of specific properties for all the assignment policies in your organization, you can pipe the results to the **Format-Table** cmdlet and specify the properties you want in the list of results. Use the following syntax.

```
Get-RoleAssignmentPolicy | Format-Table <property 1>, <property 2...>
```

This example returns a list of all the assignment policies in your organization and includes the **Name** and **IsDefault** properties.

```
Get-RoleAssignmentPolicy | Format-Table Name, IsDefault
```

For detailed syntax and parameter information, see Get-Mailbox or Get-RoleAssignmentPolicy.

Use the Exchange Management Shell to view the details of a single assignment policy

You can view the details of a specific assignment policy by using the **Get-RoleAssignmentPolicy** cmdlet and piping the output to the **Format-List** cmdlet.

This procedure makes use of pipelining and the **Format-List** cmdlet. For more information about these concepts, see the following topics:

- about_Pipelines

- Working with Command Output

To view the details of a specific assignment policy, use the following syntax.

```
Get-RoleAssignmentPolicy <assignment policy name> | Format-List
```

This example views the details about the Redmond Users - no Text Messaging assignment policy.

```
Get-RoleAssignmentPolicy "Redmond Users - no Text Messaging" | Format-List
```

For detailed syntax and parameter information, see Get-Mailbox or Get-RoleAssignmentPolicy.

Use the Exchange Management Shell to find the default assignment policy

You can find the default assignment policy by piping the output of the **Get-RoleAssignmentPolicy** cmdlet to the **Where** cmdlet. With the **Where** cmdlet, filter the data returned to display only the assignment policy that has its *IsDefault* property set to `$True`.

This procedure makes use of pipelining and the **Where** cmdlet. For more information about these concepts, see the following topics:

- about_Pipelines
- Working with Command Output

This example returns the default assignment policy.

```
Get-RoleAssignmentPolicy | Where {$_.IsDefault -eq $True}
```

For detailed syntax and parameter information, see Get-Mailbox or Get-RoleAssignmentPolicy.

Use the Exchange Management Shell to view mailboxes that are assigned a specific policy

You can find all the mailboxes assigned a specific assignment policy by piping the output of the **Get-Mailbox** cmdlet to the **Where** cmdlet. With the **Where** cmdlet, filter the data returned to display only the mailboxes that have their *RoleAssignmentPolicy* property set to the assignment policy name you specify.

This procedure makes use of pipelining and the **Where** cmdlet. For more information about these concepts, see the following topics:

- about_Pipelines
- Working with Command Output

Use the following syntax.

```
Get-Mailbox | Where {$_.RoleAssignmentPolicy -Eq "<role assignment policy>"}
```

This example finds all the mailboxes assigned the policy Vancouver End Users.

```
Get-Mailbox | Where {$_.RoleAssignmentPolicy -Eq "Vancouver End Users"}
```

For detailed syntax and parameter information, see Get-Mailbox or Get-RoleAssignmentPolicy.

Change the default assignment policy

You can change the management role assignment policy assigned to new mailboxes that are created. Changing the default role assignment policy doesn't change the assignment policy assigned to existing mailboxes. To change the assignment policy assigned to existing mailboxes, see Change the assignment policy on a mailbox.

> **NOTE**
>
> You can't use the EAC to change the default assignment policy. You need to use the Exchange Management Shell.

Use the Exchange Management Shell to change the default assignment policy

To change the default assignment policy, use the following syntax.

```
Set-RoleAssignmentPolicy <assignment policy name> -IsDefault
```

This example sets the Vancouver End Users assignment policy as the default assignment policy.

```
Set-RoleAssignmentPolicy "Vancouver End Users" -IsDefault
```

> **IMPORTANT**
>
> New mailboxes are assigned the default assignment policy even if the policy hasn't been assigned management roles. Mailboxes assigned assignment policies with no assigned management roles can't access any mailbox configuration features in Outlook on the web.

For detailed syntax and parameter information, see Set-RoleAssignmentPolicy.

Add a role to an assignment policy

Use the EAC to add a role to an assignment policy

1. In the EAC, navigate to **Permissions** > **User Roles**.

2. Select the assignment policy you want to add one or more roles to, and then click **Edit** ✎.

3. Select the check box next to the role or roles you want to add to the assignment policy. You can select multiple roles, including end-user roles you've added. If you select a role that has child roles, the child roles are automatically selected.

4. Click **Save** to save the changes to the assignment policy.

Use the Exchange Management Shell to add a role to an assignment policy

To create a management role assignment between a role and an assignment policy, use the following syntax.

```
New-ManagementRoleAssignment -Name <role assignment name> -Role <role name> -Policy <assignment policy name>
```

This example creates the role assignment Seattle Users - Voicemail between the MyVoicemail role and the Seattle Users assignment policy.

```
New-ManagementRoleAssignment -Name "Seattle Users - Voicemail" -Role MyVoicemail -Policy "Seattle Users"
```

For detailed syntax and parameter information, see New-ManagementRoleAssignment.

Remove a role from an assignment policy

If you don't want end users to have permissions to manage certain features of their mailbox or distribution group, you can remove the management role that grants the permissions from the management role assignment policy to which the user is assigned. If other users are assigned the same assignment policy, they also lose the ability to manage that feature.

Use the EAC to remove a role from an assignment policy

1. In the EAC, navigate to **Permissions** > **User Roles**.

2. Select the assignment policy you want to remove one or more roles from, and then click **Edit** ✎ .

3. Clear the check box next to the role or roles you want to remove from the assignment policy. If you clear the check box for a role that has child roles, the check boxes for the child roles are also cleared.

4. Click **Save** to save the changes to the assignment policy.

Use the Exchange Management Shell to remove a role from an assignment policy

You can remove roles from assignment policies by retrieving the associated management role assignment using the **Get-ManagementRoleAssignment** cmdlet and then piping the role assignment returned to the **Remove-ManagementRoleAssignment** cmdlet.

For more information about regular and delegating role assignments, see Understanding Management Role Assignments.

This procedure uses pipelining. For more information about pipelining, see about_Pipelines.

To remove a role from an assignment policy, use the following syntax.

```
Get-ManagementRoleAssignment -RoleAssignee <assignment policy name> -Role <role name> | Remove-
ManagementRoleAssignment
```

This example removes the MyVoicemail management role, which enables users to manage their voice mail options, from the Seattle Users assignment policy.

```
Get-ManagementRoleAssignment -RoleAssignee "Seattle Users" -Role MyVoicemail | Remove-ManagementRoleAssignment
```

For detailed syntax and parameter information, see Remove-ManagementRoleAssignment.

Change the assignment policy on a mailbox

8/3/2020 • 2 minutes to read • Edit Online

When you change a mailbox's assignment policy, the change takes effect as soon as the user refreshes the connection, such as the next time they log into their mailbox or open the mailbox options page. For more information about assignment policies in Exchange Server, see Understanding Management Role Assignment Policies.

Looking for other management tasks related to permissions? Check out Permissions.

What do you need to know before you begin?

- Estimated time to complete each procedure: 5 minutes
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Role groups" entry in the Role management permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the EAC to change the assignment policy on a mailbox

1. In the Exchange admin center (EAC), navigate to **Recipients** > **Mailboxes**.
2. Select the user or resource mailbox you want to change the assignment policy on and then click **Edit** ✎.
3. Select **Mailbox Features**.
4. In the **Role assignment policy** list, select the assignment policy you want to assign to the mailbox and then click **Save**.

Use the Exchange Management Shell to change the assignment policy on a mailbox

To change the assignment policy that's assigned to a mailbox, use the following syntax.

```
Set-Mailbox <mailbox alias or name> -RoleAssignmentPolicy <assignment policy>
```

This example sets the assignment policy to Engineering Users on the mailbox Brian.

```
Set-Mailbox Brian -RoleAssignmentPolicy "Engineering Users"
```

Use the Exchange Management Shell to change the assignment policy on a group of mailboxes assigned a specific assignment policy

NOTE

You can't use the EAC to change the assignment policy on a group of mailboxes all at once.

This procedure makes use of pipelining, the **Where** cmdlet, and the *WhatIf* parameter. For more information about these concepts, see the following topics:

- about_Pipelines
- Working with Command Output
- WhatIf, Confirm, and ValidateOnly Switches

If you want to change the assignment policy for a group of mailboxes that are assigned a specific policy, use the following syntax.

```
Get-Mailbox | Where {$_.RoleAssignmentPolicy -Eq "<assignment policy to find>"} | Set-Mailbox -
RoleAssignmentPolicy <assignment policy to set>
```

This example finds all the mailboxes assigned to the Redmond Users - No Voicemail assignment policy and changes the assignment policy to Redmond Users - Voicemail Enabled.

```
Get-Mailbox | Where {$_.RoleAssignmentPolicy -Eq "Redmond Users - No Voicemail"} | Set-Mailbox -
RoleAssignmentPolicy "Redmond Users - Voicemail Enabled"
```

This example includes the *WhatIf* parameter so that you can see all the mailboxes that would be changed without committing any changes.

```
Get-Mailbox | Where {$_.RoleAssignmentPolicy -Eq "Redmond Users - No Voicemail"} | Set-Mailbox -
RoleAssignmentPolicy "Redmond Users - Voicemail Enabled" -WhatIf
```

For detailed syntax and parameter information, see Get-Mailbox or Set-Mailbox.

Feature permissions

8/3/2020 • 2 minutes to read • Edit Online

Permissions in Microsoft Exchange Server are managed using the Role Based Access Control (RBAC) permissions model. The following topics identify the management role groups required to administer the features associated with each functional area in Exchange Server.

- Role management permissions
- Messaging policy and compliance in Exchange Server
- Antispam and antimalware permissions
- Mail flow permissions
- Recipients Permissions
- Email address and address book permissions
- Sharing and collaboration permissions
- Clients and mobile devices permissions
- Unified Messaging permissions
- High availability and site resilience permissions
- Exchange infrastructure and PowerShell permissions
- Server health and performance permissions

Role management permissions

8/3/2020 • 2 minutes to read • Edit Online

The permissions required to perform tasks to configure management roles vary depending on the procedure being performed or the cmdlet you want to run. For more information about management roles, see Understanding Management Roles.

To find out what permissions you need to perform the procedure or run the cmdlet, do the following:

1. In the table below, find the feature that is most related to the procedure you want to perform or the cmdlet you want to run.

2. Next, look at the permissions required for the feature. You must be assigned one of those role groups, an equivalent custom role group, or an equivalent management role. You can also click on a role group to see its management roles. If a feature lists more than one role group, you only need to be assigned one of the role groups to use the feature. For more information about role groups and management roles, see Understanding Role Based Access Control.

3. Now, run the **Get-ManagementRoleAssignment** cmdlet to look at the role groups or management roles assigned to you to see if you have the permissions that are necessary to manage the feature.

> **NOTE**
>
> You must be assigned the Role Management management role to run the **Get-ManagementRoleAssignment** cmdlet. If you don't have permissions to run the **Get-ManagementRoleAssignment** cmdlet, ask your Exchange administrator to retrieve the role groups or management roles assigned to you.

If you want to delegate the ability to manage a feature to another user, see Delegate role assignments.

Role management permissions

You can use the features in the following table to manage the management role groups, roles, assignment policies, assignments, scopes that define the permissions you can apply to administrators, and end users. Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

FEATURE	PERMISSIONS REQUIRED
Management roles	Organization Management
Unscoped management roles	Unscoped Role Management management role
Role groups	Organization Management
Assignment policies	Organization Management
Role assignments	Organization Management
Management scopes	Organization Management

FEATURE	PERMISSIONS REQUIRED
Management role entries	Organization Management
Legacy permissions	Organization Management
Active Directory split permissions	Organization Management **Important**: To run the `setup.exe` command with the *PrepareAD* and *ActiveDirectorySplitPermissions* parameters, the account you use must be a member of the Schema Admins and Enterprise Administrators groups.

Messaging policy and compliance permissions in Exchange Server

8/3/2020 • 3 minutes to read • Edit Online

The permissions required to configure messaging policy and compliance vary depending on the procedure being performed or the cmdlet you want to run. For more information about messaging policy and compliance, see Messaging policy and compliance in Exchange Server.

To find out what permissions you need to perform the procedure or run the cmdlet, do the following:

1. In the table below, find the feature that is most related to the procedure you want to perform or the cmdlet you want to run.

2. Next, look at the permissions required for the feature. You must be assigned one of those role groups, an equivalent custom role group, or an equivalent management role. You can also click on a role group to see its management roles. If a feature lists more than one role group, you only need to be assigned one of the role groups to use the feature. For more information about role groups and management roles, see Understanding Role Based Access Control.

3. Now, run the **Get-ManagementRoleAssignment** cmdlet to look at the role groups or management roles assigned to you to see if you have the permissions that are necessary to manage the feature.

   > **NOTE**
   >
   > You must be assigned the Role Management management role to run the **Get-ManagementRoleAssignment** cmdlet. If you don't have permissions to run the **Get-ManagementRoleAssignment** cmdlet, ask your Exchange administrator to retrieve the role groups or management roles assigned to you.

If you want to delegate the ability to manage a feature to another user, see Delegate role assignments.

Messaging policy and compliance permissions

You can use the features in the following table to configure messaging policy and compliance features. The role groups that are required to configure each feature are listed.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-Only Organization Management.

FEATURE	PERMISSIONS REQUIRED
Data loss prevention (DLP)	Compliance Management
Delete mailbox content (using the Search-Mailbox cmdlet with the *DeleteContent* switch)	Discovery Management **and** Mailbox Import Export Role **Note**: By default, the Mailbox Import Export role isn't assigned to any role group. You can assign a management role to a built-in or custom role group, a user, or a universal security group. Assigning a role to a role group is recommended. For more information, see Add a role to a role group.

FEATURE	PERMISSIONS REQUIRED
Discovery mailboxes - Create	Organization Management Recipient Management
Information Rights Management (IRM) configuration	Compliance Management Organization Management
In-Place Archive	Organization Management Recipient Management
In-Place Archive - Test connectivity	Organization Management Server Management
In-Place eDiscovery	Discovery Management **Note**: By default, the Discovery Management role group doesn't have any members. No users, including administrators, have the required permissions to search mailboxes. For more information, see Assign eDiscovery permissions in Exchange Server.
In-Place Hold	Discovery Management Organization Management **Notes**: • To create a query-based In-Place Hold, a user requires both the Mailbox Search and Legal Hold roles to be assigned directly or via membership in a role group that has both roles assigned. To create an In-Place Hold without using a query, which places all mailbox items on hold, you must have the Legal Hold role assigned. The Discovery Management role group is assigned both roles. • The Organization Management role group is assigned the Legal Hold role. Members of the Organization Management role group can place an In-Place Hold on all items in a mailbox, but can't create a query-based In-Place Hold.
Journaling	Organization Management Records Management
Litigation Hold	Organization Management
Mailbox audit logging	Organization Management Records Management
Message classifications	Organization Management
Messaging records management	Compliance Management Organization Management Records Management
Retention policies - Apply	Organization Management Recipient Management Records Management
Retention policies - Create	See the entry for Messaging records management

FEATURE	PERMISSIONS REQUIRED
Mail flow rules (also known as transport rules)	Organization Management Records Management

Antispam and antimalware permissions

8/3/2020 • 2 minutes to read • Edit Online

The permissions required to perform tasks related to antispam and antimalware vary depending on the procedure being performed or the cmdlet you want to run. For more information about transport features, see Mail flow and the transport pipeline.

This topic lists the permissions required to manage the mail flow features in Microsoft Exchange Server.

To find out what permissions you need to perform the procedure or run the cmdlet, do the following:

1. In the table below, find the feature that is most related to the procedure you want to perform or the cmdlet you want to run.

2. Next, look at the permissions required for the feature. You must be assigned one of those role groups, an equivalent custom role group, or an equivalent management role. You can also click on a role group to see its management roles. If a feature lists more than one role group, you only need to be assigned one of the role groups to use the feature. For more information about role groups and management roles, see Understanding Role Based Access Control.

3. Now, run the **Get-ManagementRoleAssignment** cmdlet to look at the role groups or management roles assigned to you to see if you have the permissions that are necessary to manage the feature.

   > **NOTE**
   >
   > You must be assigned the Role Management management role to run the **Get-ManagementRoleAssignment** cmdlet. If you don't have permissions to run the **Get-ManagementRoleAssignment** cmdlet, ask your Exchange administrator to retrieve the role groups or management roles assigned to you.

If you want to delegate the ability to manage a feature to another user, see Delegate role assignments.

> **NOTE**
>
> Some features that you want to manage might exist on Edge Transport servers. To manage features on Edge Transport servers, you need to become a member of the Local Administrators group on the Edge Transport server you want to manage. Edge Transport servers don't use Role Based Access Control (RBAC). Features that can be managed on Edge Transport servers have Edge Transport Local Administrator in the "Permissions required" column in the table below.

> **NOTE**
>
> Some features may require that you have local administrator permissions on the server you want to manage. To manage these features, you must be a member of the Local Administrators group on that server.

Antispam and Anti-Malware Permissions

You can use the features in the following tables to configure antispam and antimalware settings in your organization. The permissions that are required to configure each feature are listed.

Users who are assigned the View Only Management role group can view the configuration of the features shown in the following table. For more information, see View Only Organization Management.

FEATURE	PERMISSIONS REQUIRED
Anti-malware	Organization Management Hygiene Management
Antispam features	Organization Management Hygiene Management
Antispam features - Edge Transport	Edge Transport server local administrator

Mail flow permissions

8/3/2020 • 3 minutes to read • Edit Online

The permissions required to perform tasks related to mail flow vary depending on the procedure being performed or the cmdlet you want to run. For more information about transport features, see Mail flow and the transport pipeline.

This topic lists the permissions required to manage the mail flow features in Exchange Server 2016 and Exchange Server 2019. For information about how Microsoft 365 or Office 365 permissions relate to Exchange permissions, see About admin roles.

To find out what permissions you need to perform the procedure or run the cmdlet, do the following:

1. In the table below, find the feature that is most related to the procedure you want to perform or the cmdlet you want to run.

2. Next, look at the permissions required for the feature. You must be assigned one of those role groups, an equivalent custom role group, or an equivalent management role. You can also click a role group to see its management roles. If a feature lists more than one role group, you need to be assigned to only one of the role groups to use the feature. For more information about role groups and management roles, see Understanding Role Based Access Control.

3. Now, run the **Get-ManagementRoleAssignment** cmdlet to look at the role groups or management roles assigned to you to see if you have the permissions that are necessary to manage the feature.

   > **NOTE**
   > You must be assigned the Role Management management role to run the **Get-ManagementRoleAssignment** cmdlet. If you don't have permissions to run the **Get-ManagementRoleAssignment** cmdlet, ask your Exchange administrator to retrieve the role groups or management roles assigned to you.

If you want to delegate the ability to manage a feature to another user, see Delegate role assignments.

> **NOTE**
> Some features that you want to manage might exist on Edge Transport servers. To manage features on Edge Transport servers, you need to become a member of the Local Administrators group on the Edge Transport server you want to manage. Edge Transport servers don't use Role Based Access Control (RBAC). Features that can be managed on Edge Transport servers have Edge Transport Local Administrator in the "Permissions required" column in the table below.

> **NOTE**
> Some features may require that you have local administrator permissions on the server you want to manage. To manage these features, you must be a member of the Local Administrators group on that server.

Mail flow permissions

You can use the features in the following tables to configure mail flow settings in the Front End Transport, Mailbox Transport, and Transport services on Mailbox servers, and on Edge Transport servers. The permissions that are required to configure each feature are listed.

Users who are assigned the View Only Management role group can view the configuration of the features shown in the following table. For more information, see View Only Organization Management.

Mailbox servers

FEATURE	PERMISSIONS REQUIRED
Accepted domains	Organization Management
Active Directory site and site link management	Organization Management
Antispam features	Organization Management Hygiene Management
Antispam updates	Organization Management Hygiene Management
Certificate management	Organization Management
Delivery Agent connectors	Organization Management Server Management
DSNs	Organization Management
EdgeSync	Organization Management
Foreign connectors	Organization Management
Front End Transport service	Organization Management Server Management Hygiene Management
Journaling	Organization Management Records Management

Mailbox junk email configuration	Organization Management Records Management Recipient Management Help Desk
Mailbox Transport service	Organization Management Server Management Hygiene Management
MailTips	Organization Management
Message classifications	Organization Management Records Management
Message tracking	Organization Management Records Management Recipient Management

FEATURE	PERMISSIONS REQUIRED
Moderated transport	Organization Management Recipient Management
Queues	Organization Management Server Management
Receive connectors	Organization Management Server Management Hygiene Management
Remote domains	Organization Management
SafeList aggregation	Organization Management Records Management
Send connectors	Organization Management
Shadow redundancy	Organization Management
Testing mail flow	Organization Management Server Management
Testing mail flow rule (also known as transport rule) processing	Organization Management
Transport agents	Organization Management Records Management
Transport configuration	Organization Management
Transport logs	Organization Management Server Management
Mail flow rules (also known as transport rules)	Organization Management Records Management
Transport service	Organization Management Server Management Hygiene Management
X.400 domains	Organization Management

Edge Transport servers

FEATURE	PERMISSIONS REQUIRED
Accepted domains - Edge Transport	Edge Transport server local administrator
Address Rewriting - Edge Transport	Edge Transport server local administrator
Edge Transport server	Edge Transport server local administrator

FEATURE	PERMISSIONS REQUIRED
EdgeSync - Edge Transport	Edge Transport server local administrator
Queues - Edge Transport	Edge Transport server local administrator
Receive connectors - Edge Transport	Edge Transport server local administrator
Send connectors - Edge Transport	Edge Transport server local administrator
Transport configuration - Edge Transport	Edge Transport server local administrator
Transport logs - Edge Transport	Edge Transport server local administrator
Mail flow rules (also known as transport rules) - Edge Transport	Edge Transport server local administrator

Recipients Permissions

8/3/2020 • 4 minutes to read • Edit Online

The permissions required to perform tasks to manage recipients vary depending on the procedure being performed or the cmdlet you want to run.

To find out what permissions you need to perform the procedure or run the cmdlet, do the following:

1. In the table below, find the feature that is most related to the procedure you want to perform or the cmdlet you want to run.
2. Next, look at the permissions required for the feature. You must be assigned one of those role groups, an equivalent custom role group, or an equivalent management role. You can also click on a role group to see its management roles. If a feature lists more than one role group, you need to be assigned to only one of the role groups to use the feature. For more information about role groups and management roles, see Understanding Role Based Access Control.
3. Now, run the **Get-ManagementRoleAssignment** cmdlet to look at the role groups or management roles assigned to you to see if you have the permissions that are necessary to manage the feature.

> **NOTE**
>
> You must be assigned the Role Management management role to run the **Get-ManagementRoleAssignment** cmdlet. If you don't have permissions to run the **Get-ManagementRoleAssignment** cmdlet, ask your Exchange administrator to retrieve the role groups or management roles assigned to you.

If you want to delegate the ability to manage a feature to another user, see Delegate role assignments.

Mailbox server permissions

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

FEATURE	PERMISSIONS REQUIRED
Calendar repair, server configuration	Organization Management Server Management
Delegating Mailbox servers	Organization Management
Email address policies	Organization Management Server Management
Exchange Search	Organization Management View-Only Organization Management Server Management

FEATURE	PERMISSIONS REQUIRED
Exchange Search - diagnostics	Organization Management View-Only Organization Management Support Diagnostics role **Note:**: The Support Diagnostics role isn't assigned to a role group. For more information, see Add a role to a role group.
Group metrics	Organization Management Server Management
Import Export	Mailbox Import Export role **Note:**: The Mailbox Import Export role isn't assigned to a role group. For more information, see Mailbox Import Export Role.
Mailbox Assistants	Organization Management Server Management
Mailbox moves	Organization Management Recipient Management
Mailbox recovery	Organization Management
Mailbox repair request	Organization Management Server Management Recipient Management
Mailbox restore request	Organization Management
Mailbox server configuration	Organization Management Server Management
Manage Exchange Search Indexer service on a Mailbox server	Local Administrator on the Mailbox server
MAPI connectivity	Organization Management Server Management
OAB virtual directories	Organization Management Server Management
Remove store mailbox	Organization Management Server Management

Calendar and sharing permissions

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

FEATURE	PERMISSIONS REQUIRED

FEATURE	PERMISSIONS REQUIRED
Calendar configuration	Organization Management Recipient Management Help Desk
Calendar diagnostics	Organization Management Records Management Hygiene Management Compliance Management Help Desk
Calendar processing	Organization Management Recipient Management Help Desk
Notifications	Organization Management Recipient Management
Organization relationships	Organization Management
Sharing policies	Organization Management

Resource mailbox configuration permissions

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

FEATURE	PERMISSIONS REQUIRED
Booking policies	Organization Management Recipient Management Help Desk
Delegation	Organization Management Recipient Management
Resource mailbox schema configuration	Organization Management

Mailbox database permissions

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

FEATURE	PERMISSIONS REQUIRED
Mailbox databases	Organization Management Server Management

Recipient provisioning permissions

This table contains the various permissions that are required to manage recipients.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

FEATURE	PERMISSIONS REQUIRED
Address list, GAL	Organization Management
Antispam	Organization Management Recipient Management
Apps for Outlook	Organization Management View-Only Organization Management Help Desk
Applying sharing policies	Organization Management Recipient Management
Arbitration	Organization Management
Archive connectivity	Organization Management View-Only Organization Management Server Management
Assigning offline address books	Organization Management Recipient Management
Automatic replies	Organization Management Recipient Management Help Desk
Calendar configuration	Organization Management Recipient Management
Calendar repair	Organization Management Recipient Management
Contact aggregation settings	Organization Management Recipient Management View-Only Organization Management
Convert mailboxes	Organization Management Recipient Management

Distribution groups	Organization Management Recipient Management
Dynamic distribution groups	Organization Management Recipient Management
Email addresses	Organization Management Recipient Management UM Management

FEATURE	PERMISSIONS REQUIRED
Inbox rules	Organization Management Recipient Management Help Desk
Mail contacts	Organization Management Recipient Management
Mail tips	Organization Management Recipient Management
Mail user	Organization Management Recipient Management
Mailbox folder permissions	Organization Management Recipient Management Help Desk
Mailbox folders	Organization Management Recipient Management
MAPI connectivity	Organization Management
Message configuration	Organization Management Recipient Management Help Desk
Message quotas	Organization Management Recipient Management
Moderation	Organization Management Recipient Management
Permissions and delegation	Organization Management
Archive mailboxes	Organization Management Recipient Management
Recipient data properties	Organization Management Recipient Management
Remote mailboxes	Organization Management Recipient Management
Retention and legal holds	Organization Management Recipient Management Records Management
Send As	Organization Management Recipient Management
Spelling configuration	Organization Management Recipient Management Help Desk

FEATURE	PERMISSIONS REQUIRED
Unified Messaging (in Exchange 2016; not available in Exchange 2019)	Organization Management UM Management
User mailboxes	Organization Management Recipient Management
User photos	Organization Management Recipient Management Help Desk

Mailbox move and migration permissions

The table contains the permissions that are required to move on-premises mailboxes to different domains or forests and to migrate on-premises mailboxes to and from your cloud-based organization.

FEATURE	PERMISSIONS REQUIRED
Mailbox moves (local or cross-forest)	Organization Management Recipient Management
Mailbox moves (hybrid deployment)	Organization Management Recipient Management
Migration (on-boarding and off-boarding from the cloud)	Organization Management Recipient Management

Email address and address book permissions

8/3/2020 • 2 minutes to read • Edit Online

The permissions required to configure email address and address book features vary depending on the procedure being performed or the cmdlet you want to run. For more information about email addresses and address books, see Email addresses and address books in Exchange Server.

To find out what permissions you need to perform the procedure or run the cmdlet, do the following:

1. In the table below, find the feature that is most related to the procedure you want to perform or the cmdlet you want to run.

2. Next, look at the permissions required for the feature. You must be assigned one of those role groups, an equivalent custom role group, or an equivalent management role. You can also click on a role group to see its management roles. If a feature lists more than one role group, you only need to be assigned one of the role groups to use the feature. For more information about role groups and management roles, see Understanding Role Based Access Control.

3. Now, run the **Get-ManagementRoleAssignment** cmdlet to look at the role groups or management roles assigned to you to see if you have the permissions that are necessary to manage the feature.

> **NOTE**
> You must be assigned the Role Management management role to run the **Get-ManagementRoleAssignment** cmdlet. If you don't have permissions to run the **Get-ManagementRoleAssignment** cmdlet, ask your Exchange administrator to retrieve the role groups or management roles assigned to you.

If you want to delegate the ability to manage a feature to another user, see Delegate role assignments.

Email address and address book permissions

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

FEATURE	PERMISSIONS REQUIRED
Address book policies	Organization Management
Address lists	Organization Management
Email address policies	Organization Management
Details templates	Organization Management
Global address lists	Organization Management
Offline address books	Organization Management
Offline address book connectivity	Organization Management

Sharing and collaboration permissions

8/3/2020 • 2 minutes to read • Edit Online

The permissions required to configure sharing and collaboration features vary depending on the procedure being performed or the cmdlet you want to run. For more information about sharing and collaboration, see Collaboration and Sharing.

To find out what permissions you need to perform the procedure or run the cmdlet, do the following:

1. In the table below, find the feature that is most related to the procedure you want to perform or the cmdlet you want to run.
2. Next, look at the permissions required for the feature. You must be assigned one of those role groups, an equivalent custom role group, or an equivalent management role. You can also click on a role group to see its management roles. If a feature lists more than one role group, you only need to be assigned one of the role groups to use the feature. For more information about role groups and management roles, see Understanding Role Based Access Control.
3. Now, run the **Get-ManagementRoleAssignment** cmdlet to look at the role groups or management roles assigned to you to see if you have the permissions that are necessary to manage the feature.

> **NOTE**
>
> You must be assigned the Role Management management role to run the **Get-ManagementRoleAssignment** cmdlet. If you don't have permissions to run the **Get-ManagementRoleAssignment** cmdlet, ask your Exchange administrator to retrieve the role groups or management roles assigned to you.

If you want to delegate the ability to manage a feature to another user, see Delegate role assignments.

Sharing and collaboration feature permissions

You can use the features in the following table to configure sharing and collaboration features. The role groups that are required to configure each feature are listed.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

FEATURE	PERMISSIONS REQUIRED
Partner applications - configure	Organization Management
Public folders, mail-enabled	Organization Management Recipient Management
Public folders	Organization Management Public Folder Management
Site mailboxes	Organization Management Recipient Management

FEATURE	PERMISSIONS REQUIRED
Site mailbox provisioning policy	Organization Management Recipient Management

Clients and mobile devices permissions

8/3/2020 • 5 minutes to read • Edit Online

The permissions required to perform tasks for clients and mobile devices vary depending on the procedure being performed or the cmdlet you want to run. For more information about client and mobile device features, see Clients and mobile.

To find out what permissions you need to perform the procedure or run the cmdlet, do the following:

1. In the table below, find the feature that is most related to the procedure you want to perform or the cmdlet you want to run.

2. Next, look at the permissions required for the feature. You must be assigned one of those role groups, an equivalent custom role group, or an equivalent management role. You can also click on a role group to see its management roles. If a feature lists more than one role group, you only need to be assigned one of the role groups to use the feature. For more information about role groups and management roles, see Understanding Role Based Access Control.

3. Now, run the **Get-ManagementRoleAssignment** cmdlet to look at the role groups or management roles assigned to you to see if you have the permissions that are necessary to manage the feature.

   > **NOTE**
   > You must be assigned the Role Management management role to run the **Get-ManagementRoleAssignment** cmdlet. If you don't have permissions to run the **Get-ManagementRoleAssignment** cmdlet, ask your Exchange administrator to retrieve the role groups or management roles assigned to you.

If you want to delegate the ability to manage a feature to another user, see Delegate role assignments.

> **NOTE**
> Some features may require that you have local administrator permissions on the server you want to manage. To manage these features, you must be a member of the Local Administrators group on that server.

Client Access service permissions

You can configure any of the following features for the Client Access service.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

FEATURE	PERMISSIONS REQUIRED
Client Access service array settings	Organization Management Server Management
Client Access service settings	Server Management
Client Access service email channel settings	Organization Management Server Management

FEATURE	PERMISSIONS REQUIRED
Client Access user settings	Server Management
Client Access virtual directory settings	Organization Management Server Management
RPC Client Access settings	Organization Management Server Management View-Only Organization Management
Push notification proxy settings	Organization Management Recipient Management
OAuth authentication redirection settings	Organization Management

Exchange ActiveSync permissions

You can configure any of the following for Exchange ActiveSync.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

FEATURE	PERMISSIONS REQUIRED
Exchange ActiveSync Autoblock settings	Organization Management
Exchange ActiveSync mailbox policy settings	Organization Management Server Management
Exchange ActiveSync server settings	Organization Management Server Management
Exchange ActiveSync settings	Organization Management Server Management
Exchange ActiveSync user settings	Recipient Management
Exchange ActiveSync virtual directory settings	Organization Management Server Management
Mobile device mailbox policy settings	Organization Management Server Management
Mobile device user settings	Organization Management Server Management Recipient Management

Autodiscover permissions

You can configure the following for the Autodiscover service.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

FEATURE	PERMISSIONS REQUIRED
Autodiscover service configuration settings	Organization Management Server Management View-Only Organization Management Delegated Setup Hygiene Management
Autodiscover virtual directory settings	Organization Management Server Management

Availability service permissions

You can configure the following for the Availability service.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

FEATURE	PERMISSIONS REQUIRED
Availability service address space settings	Organization Management View-Only Organization Management
Availability service configuration settings	Organization Management Server Management View-Only Organization Management

Client throttling permissions

You can configure the following for client throttling.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

FEATURE	PERMISSIONS REQUIRED
Client throttling settings	Organization Management View-Only Organization Management

Exchange Web Services permissions

You can configure the following for Web Services virtual directories.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

FEATURE	PERMISSIONS REQUIRED
Exchange Web Services virtual directory settings	Organization Management Server Management

FEATURE	PERMISSIONS REQUIRED
Test Exchange Web Services	Organization Management Server Management
Test Outlook Web Services	Organization Management

Outlook Anywhere permissions

You can configure and manage the following settings for Outlook Anywhere.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

FEATURE	PERMISSIONS REQUIRED
Outlook Anywhere configuration (enable, disable, change, view)	Organization Management Server Management View-Only Organization Management Delegated Setup Hygiene Management
RPC over HTTP Proxy component	Local Server Administrator
Test Outlook Anywhere connectivity	Organization Management View-Only Organization Management Server Management

Outlook on the web permissions

You can use the following features to view Outlook on the web settings, control security and user access to Outlook on the web, and test Outlook on the web connectivity.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

FEATURE	PERMISSIONS REQUIRED
Graphics editor	Local Server Administrator
IIS Manager	Local Server Administrator
ISA Server 2006	ISA Server Enterprise Administrator
Outlook on the web mailbox policies	Organization Management Recipient Management
Outlook on the web virtual directories	Organization Management Server Management
Registry Editor	Local Server Administrator
S/MIME configuration	Organization Management

FEATURE	PERMISSIONS REQUIRED
Text editor	Local Server Administrator
View Outlook on the web mailbox policies	Organization Management Recipient Management View-Only Organization Management Delegated Setup Hygiene Management

POP3 and IMAP4 permissions

You can configure the following for POP3 and IMAP4.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

FEATURE	PERMISSIONS REQUIRED
IMAP4 settings	Organization Management Server Management View-Only Organization Management
POP3 settings	Organization Management Server Management View-Only Organization Management
Test IMAP4 settings	Organization Management Server Management View-Only Organization Management
Test POP3 settings	Organization Management Server Management View-Only Organization Management

Windows PowerShell virtual directory permissions

You can configure the following for Windows PowerShell.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

FEATURE	PERMISSIONS REQUIRED
Test Windows PowerShell	Organization Management
Windows PowerShell settings	Organization Management

Text Messaging permissions

You can configure the following for text messaging.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

FEATURE	PERMISSIONS REQUIRED
Text messaging notification settings	Recipient Management
Text messaging settings	Recipient Management
Text messaging user settings	Recipient Management

Unified Messaging permissions

8/3/2020 • 2 minutes to read • Edit Online

The permissions required to manage Unified Messaging services and features on Exchange 2016 Mailbox servers vary depending on the procedure being performed or the cmdlet you want to run.

> **NOTE**
>
> Unified Messaging is not available in Exchange 2019.

To find out what permissions you need to perform the procedure or run the cmdlet, do the following:

1. In the table below, find the feature that is most related to the procedure you want to perform or the cmdlet you want to run.

2. Next, look at the permissions required for the feature. You must be assigned one of those role groups, an equivalent custom role group, or an equivalent management role. You can also click on a role group to see its management roles. If a feature lists more than one role group, you only need to be assigned one of the role groups to use the feature. For more information about role groups and management roles, see Understanding Role Based Access Control.

3. Now, run the **Get-ManagementRoleAssignment** cmdlet to look at the role groups or management roles assigned to you to see if you have the permissions that are necessary to manage the feature.

   > **NOTE**
   >
   > You must be assigned the Role Management management role to run the **Get-ManagementRoleAssignment** cmdlet. If you don't have permissions to run the **Get-ManagementRoleAssignment** cmdlet, ask your Exchange administrator to retrieve the role groups or management roles assigned to you.

If you want to delegate the ability to manage a feature to another user, see Delegate role assignments.

UM component permissions

You can configure settings for the UM components and features in the following table.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

FEATURE	PERMISSIONS REQUIRED
UM auto attendants	Organization Management Unified Messaging Management
UM call answering rules	Organization Management Unified Messaging Management
UM call data and summary reports	Organization Management Unified Messaging Management

FEATURE	PERMISSIONS REQUIRED
UM Call Router service (front-end)	Organization Management Unified Messaging Management
UM dial plans	Organization Management Unified Messaging Management
UM hunt groups	Organization Management Unified Messaging Management
UM IP gateways	Organization Management Unified Messaging Management
UM mailbox policies	Organization Management Unified Messaging Management
UM mailboxes	Organization Management Unified Messaging Management
UM prompts	Organization Management Unified Messaging Management
UM service (back-end)	Organization Management Server Management

High availability and site resilience permissions

8/3/2020 • 2 minutes to read • Edit Online

The permissions required to configure high availability vary depending on the procedure being performed or the cmdlet you want to run. For more information about high availability, see High availability and site resilience.

To find out what permissions you need to perform the procedure or run the cmdlet, do the following:

1. In the table below, find the feature that is most related to the procedure you want to perform or the cmdlet you want to run.

2. Next, look at the permissions required for the feature. You must be assigned one of those role groups, an equivalent custom role group, or an equivalent management role. You can also click on a role group to see its management roles. If a feature lists more than one role group, you only need to be assigned one of the role groups to use the feature. For more information about role groups and management roles, see Understanding Role Based Access Control.

3. Now, run the **Get-ManagementRoleAssignment** cmdlet to look at the role groups or management roles assigned to you to see if you have the permissions that are necessary to manage the feature.

> **NOTE**
>
> You must be assigned the Role Management management role to run the **Get-ManagementRoleAssignment** cmdlet. If you don't have permissions to run the **Get-ManagementRoleAssignment** cmdlet, ask your Exchange administrator to retrieve the role groups or management roles assigned to you.

If you want to delegate the ability to manage a feature to another user, see Delegate role assignments.

Database availability group permissions

You can use the features in the following table to add, remove, and configure settings for database availability groups (DAGs).

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

FEATURE	PERMISSIONS REQUIRED
Database availability group membership	Organization Management Database Availability Groups
Database availability group properties	Organization Management Database Availability Groups
Database availability groups	Organization Management Database Availability Groups
Database availability networks	Organization Management Database Availability Groups

Mailbox database copy permissions

You can use the features in the following table to add, remove, update, and activate mailbox database copies.

FEATURE	PERMISSIONS REQUIRED
Database switchover	Organization Management Database Copies
Mailbox database copies	Organization Management Database Copies
Server switchover	Organization Management Database Copies
Update a mailbox database copy	Organization Management Database Copies

Exchange infrastructure and PowerShell permissions

8/3/2020 • 3 minutes to read • Edit Online

The permissions required to perform tasks to configure various components of Exchange Server depend on the procedure being performed or the cmdlet you want to run. See each of the sections in this topic for more information about their respective features.

To find out what permissions you need to perform the procedure or run the cmdlet, do the following:

1. In the table below, find the feature that is most related to the procedure you want to perform or the cmdlet you want to run.
2. Next, look at the permissions required for the feature. You must be assigned one of those role groups, an equivalent custom role group, or an equivalent management role. You can also click on a role group to see its management roles. If a feature lists more than one role group, you only need to be assigned one of the role groups to use the feature. For more information about role groups and management roles, see Understanding Role Based Access Control.
3. Now, run the **Get-ManagementRoleAssignment** cmdlet to look at the role groups or management roles assigned to you to see if you have the permissions that are necessary to manage the feature.

   > **NOTE**
   >
   > You must be assigned the Role Management management role to run the **Get-ManagementRoleAssignment** cmdlet. If you don't have permissions to run the **Get-ManagementRoleAssignment** cmdlet, ask your Exchange administrator to retrieve the role groups or management roles assigned to you.

If you want to delegate the ability to manage a feature to another user, see Delegate role assignments.

> **NOTE**
>
> Some features may require that you have local administrator permissions on the server you want to manage. To manage these features, you must be a member of the Local Administrators group on that server.

Exchange infrastructure permissions

The following table lists the permissions required to perform tasks that configure general Exchange settings.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

FEATURE	PERMISSIONS REQUIRED
Administrator audit logging	Organization Management Records Management
Exchange admin center configuration settings	View-Only Organization Management
Exchange admin center connectivity	Organization Management Server Management

FEATURE	PERMISSIONS REQUIRED
Exchange server configuration settings	Organization Management Server Management
Exchange Help settings	Organization Management
Message categories	Organization Management Hygiene Management Recipient Management Help Desk
Product key	Organization Management
Test system health	Organization Management Server Management
View-only administrator audit logging	Organization Management Records Management **Note**: You can also manually assign the View-Only Audit Logs management role to a management role group. For more information, see View-Only Audit Logs.
Write to audit log	Users that are members of any role group or assigned any management role can write to the administrator audit log.

Exchange PowerShell infrastructure permissions

The following table lists the permissions required to perform tasks that configure features that control how the Exchange Management Shell runs.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

FEATURE	PERMISSIONS REQUIRED
Active Directory Domain Services server settings	Organization Management Server Management Recipient Management UM Management
Cmdlet extension agents	Organization Management
PowerShell virtual directories	Organization Management Server Management
PowerShell and WinRM installation	Local Server Administrator
Remote PowerShell	Organization Management

Federation and certificates permissions

The following table lists permissions required for performing tasks related to federation trusts, OAuth configuration, certificate management, and hybrid deployment configuration.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

FEATURE	PERMISSIONS REQUIRED
Certificate management	Organization Management Server Management
Federation trusts, OAuth	Organization Management
Test federation trusts, OAuth	Organization Management View-Only Organization Management Server Management
Hybrid deployment configuration	Organization Management
Intra-Organization connectors	Organization Management Recipient Management Records Management

Server health and performance permissions

8/3/2020 • 2 minutes to read • Edit Online

The permissions required to perform tasks to configure various components of Exchange Server depend on the procedure being performed or the cmdlet you want to run. See each of the sections in this topic for more information about their respective features.

To find out what permissions you need to perform the procedure or run the cmdlet, do the following:

1. In the table below, find the feature that is most related to the procedure you want to perform or the cmdlet you want to run.

2. Next, look at the permissions required for the feature. You must be assigned one of those role groups, an equivalent custom role group, or an equivalent management role. You can also click on a role group to see its management roles. If a feature lists more than one role group, you only need to be assigned one of the role groups to use the feature. For more information about role groups and management roles, see Understanding Role Based Access Control.

3. Now, run the **Get-ManagementRoleAssignment** cmdlet to look at the role groups or management roles assigned to you to see if you have the permissions that are necessary to manage the feature.

   > **NOTE**
   >
   > You must be assigned the Role Management management role to run the **Get-ManagementRoleAssignment** cmdlet. If you don't have permissions to run the **Get-ManagementRoleAssignment** cmdlet, ask your Exchange administrator to retrieve the role groups or management roles assigned to you.

If you want to delegate the ability to manage a feature to another user, see Delegate role assignments.

> **NOTE**
>
> Some features may require that you have local administrator permissions on the server you want to manage. To manage these features, you must be a member of the Local Administrators group on that server.

Exchange workload management permissions

The following table lists the permissions required to perform tasks that manage the health and performance of your Exchange Server organization. For more information, see User workload management in Exchange Server.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

FEATURE	PERMISSIONS REQUIRED
User throttling	Organization Management Recipient Management View-Only Organization Management
Exchange workload throttling	Organization Management View-Only Organization Management

Exchange event log permissions

The following table lists the permissions required to perform tasks that manage Exchange event log settings.

Users who are assigned the View-Only Management role group can view the configuration of the features in the following table. For more information, see View-only Organization Management.

Split permissions in Exchange Server

8/3/2020 • 19 minutes to read • Edit Online

Organizations that separate the management of Exchange Server 2016 and Exchange Server 2019 objects and Active Directory objects use what's called a *split permissions* model. Split permissions enable organizations to assign specific permissions and related tasks to specific groups within the organization. This separation of work helps to maintain standards and workflows, and helps to control change in the organization.

The highest level of split permissions is the separation of Exchange management and Active Directory management. Many organizations have two groups: administrators that manage the organization's Exchange infrastructure, including servers and recipients, and administrators that manage the Active Directory infrastructure. This is an important separation for many organizations because the Active Directory infrastructure often spans many locations, domains, services, applications, and even Active Directory forests. Active Directory administrators must ensure that changes made to Active Directory don't negatively impact any other services. As a result, typically only a small group of administrators is allowed to manage that infrastructure.

At the same time, the infrastructure for Exchange, including servers and recipients, can also be complex and require specialized knowledge. Additionally, Exchange stores extremely confidential information about the business of the organization. Exchange administrators can potentially access this information. By limiting the number of Exchange administrators, the organization limits who can make changes to Exchange configuration and who can access sensitive information.

Split permissions typically make a distinction between the creation of security principals in Active Directory, such as users and security groups, and the subsequent configuration of those objects. This helps to reduce the chance of unauthorized access to the network by controlling who can create objects that grant access to it. Most often only Active Directory administrators can create security principals while other administrators, such as Exchange administrators, can manage specific attributes on existing Active Directory objects.

To support the varying needs to separate the management of Exchange and Active Directory, Exchange lets you choose whether you want a shared permissions model or a split permissions model. Exchange offers two types of split permissions models: RBAC and Active Directory. Exchange defaults to a shared permissions model.

Explanation of Role Based Access Control and Active Directory

To understand split permissions, you need to understand how the Role Based Access Control (RBAC) permissions model in Exchange works with Active Directory. The RBAC model controls who can perform what actions, and on which objects those actions can be performed. For more information about the various components of RBAC that are discussed in this topic, see Exchange Server permissions.

All tasks that are performed on Exchange objects must be done through the Exchange Management Shell or the Exchange admin center (EAC) interface. Both of these management tools use RBAC to authorize all tasks that are performed.

RBAC is a component that exists on every Exchange server. RBAC checks whether the user performing an action is authorized to do so:

- If the user isn't authorized to perform the action, RBAC doesn't allow the action to proceed.
- If the user is authorized to perform the action, RBAC checks whether the user is authorized to perform the action against the specific object being requested:
- If the user is authorized, RBAC allows the action to proceed.

- If the user isn't authorized, RBAC doesn't allow the action to proceed.

If RBAC allows an action to proceed, the action is performed in the context of the Exchange Trusted Subsystem and not the user's context. The Exchange Trusted Subsystem is a highly privileged universal security group (USG) that has read/write access to every Exchange-related object in the Exchange organization. It's also a member of the Administrators local security group and the Exchange Windows Permissions USG, which enables Exchange to create and manage Active Directory objects.

> **WARNING**
>
> Don't make any manual changes to the membership of the Exchange Trusted Subsystem security group. Also, don't add it to or remove it from object access control lists (ACLs). By making changes to the Exchange Trusted Subsystem USG yourself, you could cause irreparable damage to your Exchange organization.

It's important to understand that it doesn't matter what Active Directory permissions a user has when using the Exchange management tools. If the user is authorized, via RBAC, to perform an action in the Exchange management tools, the user can perform the action regardless of his or her Active Directory permissions. Conversely, if a user is an Enterprise Admin in Active Directory but isn't authorized to perform an action, such as creating a mailbox, in the Exchange management tools, the action won't succeed because the user doesn't have the required permissions according to RBAC.

> **IMPORTANT**
>
> Although the RBAC permissions model doesn't apply to the Active Directory Users and Computers management tool, Active Directory Users and Computers can't manage the Exchange configuration. S, although a user may have access to modify some attributes on Active Directory objects, such as the display name of a user, the user must use the Exchange management tools, and therefore must be authorized by RBAC, to manage Exchange attributes.

Shared permissions

The shared permissions model is the default model for Exchange. You don't need to change anything if this is the permissions model you want to use. This model doesn't separate the management of Exchange and Active Directory objects from within the Exchange management tools. It allows administrators using the Exchange management tools to create security principals in Active Directory.

The following table shows the roles that enable the creation of security principals in Exchange and the management role groups they're assigned to by default.

MANAGEMENT ROLE	ROLE GROUP
Mail Recipient Creation role	Organization Management Recipient Management
Security Group Creation and Membership role	Organization Management

Only role groups, users, or USGs that are assigned the Mail Recipient Creation role can create security principals such as Active Directory users. By default, the Organization Management and Recipient Management role groups are assigned this role. Therefore members of these role groups can create security principals.

Only role groups, users, or USGs that are assigned the Security Group Creation and Membership role can create security groups or manage their memberships. By default, only the Organization Management role group is assigned this role. Therefore only members of the Organization Management role group can create or manage the membership of security groups.

You can assign the Mail Recipient Creation role and the Security Group Creation and Membership role to other role groups, users, or USGs if you want other users to be able to create security principals.

To enable the management of existing security principals in Exchange, the Mail Recipients role is assigned to the Organization Management and Recipient Management role groups by default. Only role groups, users, or USGs that are assigned the Mail Recipients role can manage existing security principals. If you want other role groups, users, or USGs to be able to manage existing security principals, you must assign the Mail Recipients role to them.

For more information about how to add roles to role groups, users, or USGs, see the following topics:

- Manage role groups
- Add a role to a user or USG

If you switched to a split permissions model and want to change back to a shared permissions model, see Configure Exchange Server for shared permissions.

Split permissions

If your organization separates Exchange management and Active Directory management, you need to configure Exchange to support the split permissions model. When configured correctly, only the administrators who you want to create security principals, such as Active Directory administrators, will be able to do so and only Exchange administrators will be able to modify the Exchange attributes on existing security principals. This splitting of permissions also falls roughly along the lines of the domain and configuration partitions in Active Directory. Partitions are also called naming contexts. The domain partition stores the users, groups, and other objects for a specific domain. The configuration partition stores the forest-wide configuration information for the services that used Active Directory, such as Exchange. Data that's stored in the domain partition is typically managed by Active Directory administrators, although objects may contain Exchange-specific attributes that can be managed by Exchange administrators. Data that's stored in the configuration partition is managed by the administrators for each respective service that stores data in this partition. For Exchange, this is typically Exchange administrators.

Exchange supports the two following types of split permissions:

- **RBAC split permissions**: Permissions to create security principals in the Active Directory domain partition are controlled by RBAC. Only Exchange servers, services, and those who are members of the appropriate role groups can create security principals.
- **Active Directory split permissions**: Permissions to create security principals in the Active Directory domain partition are completely removed from any Exchange user, service, or server. No option is provided in RBAC to create security principals. Creation of security principals in Active Directory must be performed using Active Directory management tools.

> **IMPORTANT**
>
> In coexistence scenarios, Active Directory split permissions configuration also applies to any Exchange 2010 or later servers in the organization.

If your organization chooses to use a split permissions model instead of shared permissions, we recommend that you use the RBAC split permissions model. The RBAC split permissions model provides significantly more flexibility while providing the nearly same administration separation as Active Directory split permissions, with the exception that Exchange servers and services can create security principals in the RBAC split permissions model.

You're asked whether you want to enable Active Directory split permissions during Setup. If you choose to enable Active Directory split permissions, you can only change to shared permissions or RBAC split permissions by rerunning Setup and disabling Active Directory split permissions. This choice applies to all Exchange 2010 or later servers in the organization.

The following sections describe RBAC and Active Directory split permissions in more detail.

RBAC split permissions

The RBAC security model modifies the default management role assignments to separate who can create security principals in the Active Directory domain partition from those who administer the Exchange organization data in the Active Directory configuration partition. Security principals, such as users with mailboxes and distribution groups, can be created by administrators who are members of the Mail Recipient Creation and Security Group Creation and Membership roles. These permissions remain separate from the permissions required to create security principals outside of the Exchange management tools. Exchange administrators who aren't assigned the Mail Recipient Creation or Security Group Creation and Membership roles can still modify Exchange-related attributes on security principals. Active Directory administrators also have the option of using the Exchange management tools to create Active Directory security principals.

Exchange servers and the Exchange Trusted Subsystem also have permissions to create security principals in Active Directory on behalf of users and third-party programs that integrate with RBAC.

RBAC split permissions is a good choice for your organization if the following are true:

- Your organization doesn't require that security principal creation be performed using only Active Directory management tools and only by users who are assigned specific Active Directory permissions.
- Your organization allows services, such as Exchange servers, to create security principals.
- You want to simplify the process required to create mailboxes, mail-enabled users, distribution groups, and role groups by allowing their creation from within the Exchange management tools.
- You want to manage the membership of distribution groups and role groups within the Exchange management tools.
- You have third-party programs that require that Exchange servers be able to create security principals on their behalf.

If your organization requires a complete separation of Exchange and Active Directory administration where no Active Directory administration can be performed using Exchange management tools or by Exchange services, see the Active Directory Split Permissions section later in this topic.

Switching from shared permissions to RBAC split permissions is a manual process where you remove the permissions required to create security principals from the role groups that are granted them by default. The following table shows the roles that enable the creation of security principals in Exchange and the management role groups they're assigned to by default.

MANAGEMENT ROLE	ROLE GROUP
Mail Recipient Creation role	Organization Management Recipient Management
Security Group Creation and Membership role	Organization Management

By default, members of the Organization Management and Recipient Management role groups can create security principals. You must transfer the ability to create security principals from the built-in role groups to a new role group that you create.

To configure RBAC split permissions, you must do the following:

1. Disable Active Directory split permissions if it's enabled.

2. Create a role group, which will contain the Active Directory administrators that will be able to create security principals.

3. Create regular and delegating role assignments between the Mail Recipient Creation role and the new role group.

4. Create regular and delegating role assignments between the Security Group Creation and Membership role and the new role group.

5. Remove the regular and delegating management role assignments between the Mail Recipient Creation role and the Organization Management and Recipient Management role groups.

6. Remove the regular and delegating role assignments between the Security Group Creation and Membership role and the Organization Management role group.

After completing these steps, only members of the new role group that you create will be able to create security principals, such as mailboxes. The new group will only be able to create the objects. It won't be able to configure the Exchange attributes on the new object. An Active Directory administrator, who is a member of the new group, will need to create the object, and then an Exchange administrator will need to configure the Exchange attributes on the object. Exchange administrators won't be able to use the following cmdlets:

- **New-Mailbox**
- **New-MailContact**
- **New-MailUser**
- **New-RemoteMailbox**
- **Remove-Mailbox**
- **Remove-MailContact**
- **Remove-MailUser**
- **Remove-RemoteMailbox**

Exchange administrators will, however, be able to create and manage Exchange-specific objects, such as mail flow rules (also known as transport rules), distribution groups, and so on and manage Exchange-related attributes on any object.

Additionally, the associated features in the EAC and Outlook on the web (formerly known as Outlook Web App), such as the New Mailbox Wizard, will also no longer be available or will generate an error if you try to use them.

If you want the new role group to also be able to manage the Exchange attributes on the new object, the Mail Recipients role also needs to be assigned to the new role group.

For more information about configuring a split permissions model, see Configure Exchange 2013 for split permissions.

Active Directory split permissions

With Active Directory split permissions, the creation of security principals in the Active Directory domain partition, such as mailboxes and distribution groups, must be performed using Active Directory management tools. Several changes are made to the permissions granted to the Exchange Trusted Subsystem and Exchange servers to limit what Exchange administrators and servers can do. The following changes in functionality occur when you enable Active Directory split permissions:

- Creation of mailboxes, mail-enabled users, distribution groups, and other security principals is removed from the Exchange management tools.

- Adding and removing distribution group members can't be done from the Exchange management tools.
- All permissions granted to the Exchange Trusted Subsystem and Exchange servers to create security principals are removed.
- Exchange servers and the Exchange management tools can only modify the Exchange attributes of existing security principals in Active Directory.

For example, to create a mailbox with Active Directory split permissions enabled, a user must first be created using Active Directory tools by a user with the required Active Directory permissions. Then, the user can be mailbox-enabled using the Exchange management tools. Only the Exchange-related attributes of the mailbox can be modified by Exchange administrators using the Exchange management tools.

Active Directory split permissions is a good choice for your organization if the following are true:

- Your organization requires that security principals be created using only the Active Directory management tools or only by users who are granted specific permissions in Active Directory.
- You want to completely separate the ability to create security principals from those who manage the Exchange organization.
- You want to perform all distribution group management, including creation of distribution groups and adding and removing members of those groups, using Active Directory management tools.
- You don't want Exchange servers, or third-party programs that use Exchange on their behalf, to create security principals.

Notes:

- Switching to Active Directory split permissions is a choice that you can make when you install Exchange by using the Setup wizard or the */ActiveDirectorySplitPermissions* command line switch with Setup.exe (and you must always specify the */PrepareAD* switch along with the */ActiveDirectorySplitPermissions* switch).
- You can also enable or disable Active Directory split permissions **after** you've installed Exchange by rerunning Setup.exe from the command line. To enable Active Directory split permissions, use the value `/ActiveDirectorySplitPermissions:True`. To disable it, use the value `/ActiveDirectorySplitPermissions:False`.
- If you have multiple domains within the same forest, you must also do one of the following steps:
  - Specify the */PrepareAllDomains* switch when you apply Active Directory split permissions.
  - Run Setup.exe with the */PrepareDomain* switch in each domain. You must prepare every domain that contains Exchange servers, mail-enabled objects, or global catalog servers that could be accessed by an Exchange server.
- You can't enable Active Directory split permissions if you've installed Exchange 2010 or later on a domain controller.
- After you enable or disable Active Directory split permissions, we recommend that you restart the Exchange servers in your organization to force them to pick up the new Active Directory access token with the updated permissions.

Exchange achieves Active Directory split permissions by removing permissions and membership from the Exchange Windows Permissions security group. This security group, in shared permissions and RBAC split permissions, is given permissions to many non-Exchange objects and attributes throughout Active Directory. By removing the permissions and membership to this security group, Exchange administrators and services are prevented from creating or modifying those non-Exchange Active Directory objects.

For a list of changes that occur to the Exchange Windows Permissions security group and other Exchange components when you enable or disable Active Directory split permissions, see the following table.

NOTE

Role assignments to role groups that enable Exchange administrators to create security principals are removed when Active Directory split permissions is enabled. This is done to remove access to cmdlets that would otherwise generate an error when they're run because they don't have permissions to create the associated Active Directory object.

ACTION	CHANGES MADE BY EXCHANGE
Enable Active Directory split permissions during first Exchange Server installation	The following actions happen when you enable Active Directory split permissions either through the Setup wizard or by running Setup.exe with the */PrepareAD* and `/ActiveDirectorySplitPermissions:true` command line switches: • An organizational unit (OU) named **Microsoft Exchange Protected Groups** is created. • The **Exchange Windows Permissions** security group is created in the **Microsoft Exchange Protected Groups** OU. • The **Exchange Trusted Subsystem** security group isn't added to the **Exchange Windows Permissions** security group. • Creation of non-delegating management role assignments to management roles with the following management role types is skipped: `MailRecipientCreation` and `SecurityGroupCreationandMembership`. • Access control entries (ACEs) that would have been assigned to the **Exchange Windows Permissions** security group aren't added to the Active Directory domain object. If you run Setup.exe with the */PrepareAllDomains* or */PrepareDomain* switch, the following actions happen in each child domain that's prepared: • All ACEs assigned to the **Exchange Windows Permissions** security group are removed from the domain object. • ACEs are set in each domain with the exception of any ACEs assigned to the **Exchange Windows Permissions** security group.

ACTION	CHANGES MADE BY EXCHANGE
Switch from shared permissions or RBAC split permissions to Active Directory split permissions	The following actions happen when you run the setup.exe command with the */PrepareAD* and `/ActiveDirectorySplitPermissions:true` command line switches: • An OU named **Microsoft Exchange Protected Groups** is created. • The **Exchange Windows Permissions** security group is moved to the **Microsoft Exchange Protected Groups** OU. • The **Exchange Trusted Subsystem** security group is removed from the **Exchange Windows Permissions** security group. • Any non-delegating role assignments to management roles with the following role types are removed: `MailRecipientCreation` and `SecurityGroupCreationandMembership`. • All ACEs assigned to the **Exchange Windows Permissions** security group are removed from the domain object. If you run Setup.exe with either the */PrepareAllDomains* or */PrepareDomain* switch, the following actions happen in each child domain that's prepared: • All ACEs assigned to the **Exchange Windows Permissions** security group are removed from the domain object. • ACEs are set in each domain with the exception of any ACEs assigned to the **Exchange Windows Permissions** security group.

ACTION	CHANGES MADE BY EXCHANGE
Switch from Active Directory split permissions to shared permissions or RBAC split permissions	The following actions happen when you run Setup.exe with the */PrepareAD* and `/ActiveDirectorySplitPermissions:false` switches: • The **Exchange Windows Permissions** security group is moved to the **Microsoft Exchange Security Groups** OU. • The **Microsoft Exchange Protected Groups** OU is removed. • The **Exchange Trusted Subsystems** security group is added to the **Exchange Windows Permissions** security group. •ACEs are added to the domain object for the **Exchange Windows Permissions** security group. If you run setup with either the */PrepareAllDomains* or */PrepareDomain* switch, the following actions happen in each child domain that's prepared: • ACEs are added to the domain object for the **Exchange Windows Permissions** security group. • ACEs are set in each domain including ACEs assigned to the **Exchange Windows Permissions** security group. Role assignments to the Mail Recipient Creation and Security Group Creation and Membership roles aren't automatically created when switching from Active Directory split to shared permissions. If delegating role assignments were customized prior to Active Directory split permissions being enabled, those customizations are left intact. To create role assignments between these roles and the Organization Management role group, see Configure Exchange Server for shared permissions.

After you enable Active Directory split permissions, the following cmdlets are no longer available:

- **New-Mailbox**
- **New-MailContact**
- **New-MailUser**
- **New-RemoteMailbox**
- **Remove-Mailbox**
- **Remove-MailContact**
- **Remove-MailUser**
- **Remove-RemoteMailbox**

After you enable Active Directory split permissions, the following cmdlets are accessible but you can't use them to create distribution groups or modify distribution group membership:

- **Add-DistributionGroupMember**
- **New-DistributionGroup**
- **Remove-DistributionGroup**
- **Remove-DistributionGroupMember**

- **Update-DistributionGroupMember**

Some cmdlets, although still available, may offer only limited functionality when used with Active Directory split permissions. This is because they may allow you to configure recipient objects that are in the domain Active Directory partition and Exchange configuration objects that are in the configuration Active Directory partition. They may also allow you to configure Exchange-related attributes on objects stored in the domain partition. Attempts to use the cmdlets to create objects, or modify non-Exchange-related attributes on objects, in the domain partition will result in an error. For example, the **Add-ADPermission** cmdlet will return an error if you attempt to add permissions to a mailbox. However, the **Add-ADPermission** cmdlet will succeed if you configure permissions on a Receive connector. This is because a mailbox is stored in the domain partition while Receive connectors are stored in the configuration partition.

Additionally, the associated features in the EAC and Outlook on the web, such as the New Mailbox wizard, will also no longer be available or will generate an error if you try to use them.

Exchange administrators will, however, be able to create and manage Exchange-specific objects, such as mail flow rules, and so on.

For more information about configuring an Active Directory split permissions model, see Configure Exchange 2013 for split permissions.

Configure Exchange Server for split permissions

8/3/2020 • 8 minutes to read • Edit Online

Split permissions enable two separate groups, such as Active Directory administrators and Exchange administrators, to manage their respective services, objects, and attributes. Active Directory administrators manage security principals, such as users, that provide permissions to access an Active Directory forest. Exchange administrators manage the Exchange-related attributes on Active Directory objects and Exchange-specific object creation and management.

Exchange Server 2016 and Exchange Server 2019 offer the following types of split permissions models:

- **RBAC split permissions**: Permissions to create security principals in the Active Directory domain partition are controlled by Role Based Access Control (RBAC). Only those who are members of the appropriate role groups can create security principals.

- **Active Directory split permissions**: Permissions to create security principals in the Active Directory domain partition are completely removed from any Exchange user, service, or server. No option is provided in RBAC to create security principals. Creation of security principals in Active Directory must be performed using Active Directory management tools.

The model that you choose depends on the structure and needs of your organization. Choose the procedure that follows that's applicable to the model you want to configure. We recommend that you use the RBAC split permissions model. The RBAC split permissions model provides significantly more flexibility while providing the same administration separation as Active Directory split permissions.

For more information about shared and split permissions, see Split permissions in Exchange Server.

For more information about management role groups, management roles, and regular and delegating management role assignments, see the following topics:

- Understanding Role Based Access Control

- Understanding management role groups

- Understanding management roles

- Understanding management role assignments

What do you need to know before you begin?

- Estimated time to complete each procedure: 5 minutes

- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Active Directory split permissions" entry in the Role management permissions topic.

- The permissions model that you select will be applied to all Exchange 2010 or later servers in your organization.

- To download the latest version of Exchange, see Updates for Exchange Server.

- To open the Exchange Management Shell, see Open the Exchange Management Shell.

TIP

Having problems? Ask for help in the Exchange Server forums.

Switch to RBAC split permissions

After you've switched to RBAC split permissions, only Active Directory administrators will be able to create Active Directory security principals. This means that Exchange administrators won't be able to use the following cmdlets:

- **New-Mailbox**
- **New-MailContact**
- **New-MailUser**
- **New-RemoteMailbox**
- **Remove-Mailbox**
- **Remove-MailContact**
- **Remove-MailUser**
- **Remove-RemoteMailbox**

Exchange administrators will only be able to manage the Exchange attributes on existing Active Directory security principals. However, They will be able to create and manage Exchange-specific objects, such as mail flow rules (also known as transport rules) and distribution groups. For more information, see the "RBAC Split Permissions" section in Split permissions in Exchange Server.

To configure Exchange for split permissions, you must assign the Mail Recipient Creation role and the Security Group Creation and Membership role to a role group that contains members that are Active Directory administrators. You must then remove the assignments between those roles and any role group or universal security group (USG) that contains Exchange administrators.

To configure RBAC split permissions, do the following steps:

1. If your organization is currently configured for Active Directory split permissions, do the following steps:

   a. On the target server, open File Explorer, right-click on the Exchange ISO image file, and then select **Mount**. Note the virtual DVD drive letter that's assigned.

   b. Open a Windows Command Prompt window. For example:

   - Press the Windows key + 'R' to open the **Run** dialog, type cmd.exe, and then press **OK**.
   - Press **Start**. In the **Search** box, type **Command Prompt**, then in the list of results, select **Command Prompt**.

   c. In the Command Prompt window, run the following command to disable Active Directory split permissions:

   ```
   Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareAD /ActiveDirectorySplitPermissions:false
   ```

   d. Restart all Exchange servers in your organization or wait for the Active Directory access token to replicate to all of your Exchange servers.

2. Do the following steps in the Exchange Management Shell:

a. Create a role group for the Active Directory administrators. In addition to creating the role group, the command creates regular role assignments between the new role group and the Mail Recipient Creation role and the Security Group Creation and Membership role.

```
New-RoleGroup "Active Directory Administrators" -Roles "Mail Recipient Creation", "Security Group
Creation and Membership"
```

> **NOTE**
>
> If you want members of this role group to be able to create role assignments, include the Role Management role. You don't have to add this role now. However, if you ever want to assign either the Mail Recipient Creation role or Security Group Creation and Membership role to other role assignees, the Role Management role must be assigned to this new role group. The steps that follow configure the Active Directory Administrators role group as the only role group that can delegate these roles.

b. Create delegating role assignments between the new role group and the Mail Recipient Creation role and Security Group Creation and Membership role by running the following commands:

```
New-ManagementRoleAssignment -Role "Mail Recipient Creation" -SecurityGroup "Active Directory
Administrators" -Delegating
New-ManagementRoleAssignment -Role "Security Group Creation and Membership" -SecurityGroup
"Active Directory Administrators" -Delegating
```

c. Add members to the new role group by running the following command:

```
Add-RoleGroupMember "Active Directory Administrators" -Member <user to add>
```

d. Replace the delegate list on the new role group so that only members of the role group can add or remove members by running the following command:

```
Set-RoleGroup "Active Directory Administrators" -ManagedBy "Active Directory Administrators"
```

> **IMPORTANT**
>
> Members of the Organization Management role group, or those who are assigned the Role Management role, either directly or through another role group or USG, can bypass this delegate security check. If you want to prevent any Exchange administrator from adding himself or herself to the new role group, you must remove the role assignment between the Role Management role and any Exchange administrator and assign it to another role group.

e. Find all of the regular and delegating role assignments to the Mail Recipient Creation role by running the following command:

```
Get-ManagementRoleAssignment -Role "Mail Recipient Creation" | Format-Table Name, Role,
RoleAssigneeName -Auto
```

f. Remove all of the regular and delegating role assignments to the Mail Recipient Creation role that aren't associated with the new role group or any other role groups, USGs, or direct assignments you want to keep by running the following command:

```
Remove-ManagementRoleAssignment <Mail Recipient Creation role assignment to remove>
```

> **NOTE**
>
> If you want to remove all of the regular and delegating role assignments to the Mail Recipient Creation role on any role assignee other than the Active Directory Administrators role group, use the following command. The *WhatIf* switch lets you see what role assignments will be removed. Remove the *WhatIf* switch and run the command again to remove the role assignments.

```
Get-ManagementRoleAssignment -Role "Mail Recipient Creation" | Where { $_.RoleAssigneeName -NE
"Active Directory Administrators" } | Remove-ManagementRoleAssignment -WhatIf
```

g. Find all of the regular and delegating role assignments to the Security Group Creation and Membership role by running the following command.

```
Get-ManagementRoleAssignment -Role "Security Group Creation and Membership" | Format-Table Name,
Role, RoleAssigneeName -Auto
```

h. Remove all of the regular and delegating role assignments to the Security Group Creation and Membership role that aren't associated with the new role group or any other role groups, USGs, or direct assignments you want to keep by running the following command:

```
Remove-ManagementRoleAssignment <Security Group Creation and Membership role assignment to
remove>
```

> **NOTE**
>
> You can use the same command in the preceding Note to remove all of the regular and delegating role assignments to the Security Group Creation and Membership role on any role assignee other than the Active Directory Administrators role group, as shown in this example.

```
Get-ManagementRoleAssignment -Role "Security Group Creation and Membership" | Where {
$_.RoleAssigneeName -NE "Active Directory Administrators" } | Remove-ManagementRoleAssignment -
WhatIf
```

For detailed syntax and parameter information, see the following topics:

- New-RoleGroup
- New-ManagementRoleAssignment
- Add-RoleGroupMember
- Set-RoleGroup
- Get-ManagementRoleAssignment
- Remove-ManagementRoleAssignment

Switch to Active Directory split permissions

You can configure your Exchange organization for Active Directory split permissions. Active Directory split permissions completely remove the permissions that allow Exchange administrators and servers from creating security principals in Active Directory or modifying non-Exchange attributes on those objects. When you are done, only Active Directory administrators will be able to create Active Directory security principals. This means that Exchange administrators won't be able to use the following cmdlets:

- Add-DistributionGroupMember
- New-DistributionGroup
- New-Mailbox
- New-MailContact
- New-MailUser
- New-RemoteMailbox
- Remove-DistributionGroup
- Remove-DistributionGroupMember
- Remove-Mailbox
- Remove-MailContact
- Remove-MailUser
- Remove-RemoteMailbox
- Update-DistributionGroupMember

Exchange administrators and servers will only be able to manage the Exchange attributes on existing Active Directory security principals. However, they will be able to create and manage Exchange-specific objects, such as transport rules and Unified Messaging dial plans.

> **WARNING**
> After you enable Active Directory split permissions, Exchange administrators and servers will no longer be able to create security principals in Active Directory, and they won't be able to manage distribution group membership. These tasks must be performed using Active Directory management tools with the required Active Directory permissions. Before you make this change, you should understand the impact it will have on your administration processes and third-party applications that integrate with Exchange and the RBAC permissions model.
>
> For more information, see the "Active Directory split permissions" section in Split permissions in Exchange Server.

To switch from shared or RBAC split permissions to Active Directory split permissions, do the following steps:

1. On the target server, open File Explorer, right-click on the Exchange ISO image file, and then select **Mount**. Note the virtual DVD drive letter that's assigned.

2. In a Windows Command Prompt window, run the following command to enable Active Directory split permissions:

   ```
   Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareAD /ActiveDirectorySplitPermissions:true
   ```

3. If you have multiple Active Directory domains in your organization, you must either run `Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareDomain` in each child domain that contains Exchange servers or objects or run `Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareAllDomains` from a site that has an Active Directory server from every domain.

4. Restart all Exchange servers in your organization or wait for the Active Directory access token to replicate to all of you Exchange 2013 servers.

Configure Exchange Server for shared permissions

8/3/2020 • 7 minutes to read • Edit Online

If you've never configured your organization for split permissions, you don't need to perform this procedure. Exchange Server 2016 and Exchange Server 2019 are configured for shared permissions by default.

Shared permissions enable you, as an Exchange administrator, to create Active Directory security principals, such as users, and then configure them as Exchange recipients. Unlike split permissions, which separate management tasks between groups of Exchange administrators and Active Directory administrators, there's no separation of tasks with shared permissions.

For more information about shared and split permissions, see Split permissions in Exchange Server.

You can configure your Exchange organization for shared permissions if you've previously set your organization for split permissions. The procedure to switch to shared permissions is different depending on whether you're currently using Role Based Access Control (RBAC) split permissions or Active Directory split permissions. Choose the procedure that follows that's applicable to your current configuration. If the following are true, your organization is using Active Directory split permissions:

- The Microsoft Exchange Protected Groups organizational unit (OU) exists.
- The Exchange Windows Permissions security group is located in the Microsoft Exchange Protected Groups OU.
- The Exchange Trusted Subsystem security group is a member of the Exchange Windows Permissions security group.
- There are no regular management role assignments to the Mail Recipient Creation role or Security Group Creation and Membership role.

For more information about management role groups, management roles, and regular and delegating management role assignments, see the following topics:

- Understanding Role Based Access Control
- Understanding management role groups
- Understanding management roles
- Understanding management role assignments

What do you need to know before you begin?

- Estimated time to complete each procedure: 5 minutes
- Procedures in this topic require specific permissions. See each procedure for its permissions information.
- The Exchange organization must currently be configured for RBAC or Active Directory split permissions.
- The permissions model that you select will be applied to all Exchange 2010 or later servers in your organization.
- You must have permissions to delegate the Mail Recipient Creation management role and the Security Group Creation and Membership management role to the Organization Management management role group or another role group that's assigned the Mail Recipients role.

- To download the latest version of Exchange on the target computer, see Updates for Exchange Server.
- To open the Exchange Management Shell, see Open the Exchange Management Shell.

> **TIP**
>
> Having problems? Ask for help in the Exchange Server forums.

Switch from RBAC split permissions to shared permissions

You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Role groups" entry in the Role management permissions topic.

To switch from RBAC split permissions to Exchange shared permissions, you must assign the Mail Recipient Creation role and the Security Group Creation and Membership role to a role group that's also assigned the Mail Recipients role and has Exchange administrators as members. In the default shared permissions configuration, the Organization Management role group contains each of these roles. Because of this, the Organization Management role group is in this procedure.

Configure shared permissions

To configure shared permissions on the Organization Management role group, do the following steps using an account that has permissions to delegate role assignments for the Mail Recipient Creation role and the Security Group Creation and Membership role:

1. Add delegating role assignments for the Mail Recipient Creation role and Security Group Creation and Membership role to the Organization Management role group using the following commands.

   ```
   New-ManagementRoleAssignment -Role "Mail Recipient Creation" -SecurityGroup "Organization Management" -
   Delegating
   New-ManagementRoleAssignment -Role "Security Group Creation and Membership" -SecurityGroup
   "Organization Management" -Delegating
   ```

   > **NOTE**
   >
   > The role group (in this procedure, the Active Directory Administrators role group) that has delegating role assignments for the Mail Recipient Creation role and Security Group Creation and Membership role must be assigned the Role Management role to run the **New-ManagementRoleAssignment** cmdlet. The role assignee that can delegate the Role Management role must assign that role to the Active Directory Administrators role group.

2. Add regular role assignments for the Mail Recipient Creation role to the Organization Management and Recipient Management role groups using the following commands.

   ```
   New-ManagementRoleAssignment -Role "Mail Recipient Creation" -SecurityGroup "Organization Management"
   New-ManagementRoleAssignment -Role "Security Group Creation and Membership" -SecurityGroup "Recipient
   Management"
   ```

3. Add a regular role assignment for the Security Group Creation and Membership role to the Organization Management role group using the following command.

   ```
    New-ManagementRoleAssignment -Role "Security Group Creation and Membership" -SecurityGroup
   "Organization Management"
   ```

For detailed syntax and parameter information, see New-ManagementRoleAssignment.

Remove permissions from Active Directory administrators (Optional)

You can optionally remove the permissions granted to Active Directory administrators if you no longer want them to be able to create or manage Active Directory objects using the Exchange management tools. If you want to remove permissions from Active Directory administrators, perform this procedure.

> **NOTE**
>
> Although you can remove permissions for Active Directory administrators to manage Active Directory objects using the Exchange management tools, Active Directory administrators can continue to manage Active Directory objects using Active Directory management tools, if their Active Directory permissions allow it. They won't, however, be able to manage Exchange-specific attributes on Active Directory objects. For more information, see Split permissions in Exchange Server.

To remove Exchange-related split permissions from Active Directory administrators, do the following steps:

1. Remove the regular and delegating role assignments that assign the Mail Recipient Creation role to the role group or universal security group (USG) that contains the Active Directory administrators as members using the following command. This command uses the Active Directory Administrators role group as an example. The *WhatIf* switch lets you see what role assignments will be removed. Remove the *WhatIf* switch, and run the command again to remove the role assignments.

   ```
   Get-ManagementRoleAssignment -Role "Mail Recipient Creation" | Where { $_.RoleAssigneeName -EQ "Active Directory Administrators" } | Remove-ManagementRoleAssignment -WhatIf
   ```

2. Remove the regular and delegating role assignments that assign the Security Group Creation and Membership role to the role group or USG that contains the Active Directory administrators as members using the following command. This command uses the Active Directory Administrators role group as an example. The *WhatIf* switch lets you see what role assignments will be removed. Remove the *WhatIf* switch, and run the command again to remove the role assignments.

   ```
   Get-ManagementRoleAssignment -Role "Security Group Creation and Membership" | Where { $_.RoleAssigneeName -EQ "Active Directory Administrators" } | Remove-ManagementRoleAssignment -WhatIf
   ```

3. Optional. If you want to remove all Exchange permissions from the Active Directory administrators, you can remove the role group or USG in which they're members. For more information about how to remove a role group, see Manage role groups.

For detailed syntax and parameter information, see Get-ManagementRoleAssignment or Remove-ManagementRoleAssignment.

Switch from Active Directory split permissions to shared permissions

You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Active Directory split permissions" entry in the Role management permissions topic.

To switch from Active Directory split permissions to Exchange shared permissions, you must rerun Exchange Setup to disable Active Directory split permissions in the Exchange organization, and then create role assignments between a role group and the Mail Recipient Creation role and Security Group Creation and Membership role. In the default shared permissions configuration, the Organization Management role group contains each of these roles. Because of this, the Organization Management role group is in this procedure.

IMPORTANT

The Setup.exe command in this procedure makes changes to Active Directory. You must use an account that has the permissions required to make these changes. This account might not be the same account that has permissions to create role assignments using the **New-ManagementRoleAssignment** cmdlet. Use the account, or accounts, with the permissions necessary to successfully complete each step in this procedure.

To switch from Active Directory split permissions to shared permissions, do the following steps:

1. On the target server, open File Explorer, right-click on the Exchange ISO image file that you downloaded, and then select **Mount**. Note the virtual DVD drive letter that's assigned.
2. Open a Windows Command Prompt window. For example:
   - Press the Windows key + 'R' to open the **Run** dialog, type cmd.exe, and then press **OK**.
   - Press **Start**. In the **Search** box, type **Command Prompt**, then in the list of results, select **Command Prompt**.
3. In the Command Prompt window, run the following command:

```
Setup.exe /IAcceptExchangeServerLicenseTerms /PrepareAD /ActiveDirectorySplitPermissions:false
```

4. In the Exchange Management Shell, run the following commands to add regular role assignments between the Mail Recipient Creation role and Security Group Creation and Management role and the Organization Management and Recipient Management role groups.

```
New-ManagementRoleAssignment "Mail Recipient Creation_Organization Management" -Role "Mail Recipient
Creation" -SecurityGroup "Organization Management"
New-ManagementRoleAssignment "Security Group Creation and Membership_Org Management" -Role "Security
Group Creation and Membership" -SecurityGroup "Organization Management"
New-ManagementRoleAssignment "Mail Recipient Creation_Recipient Management" -Role "Mail Recipient
Creation" -SecurityGroup "Recipient Management"
```

5. Restart all Exchange servers in your organization.

For detailed syntax and parameter information, see New-ManagementRoleAssignment.

Recipients

8/3/2020 • 15 minutes to read • Edit Online

The people and resources that send and receive messages are the core of any messaging and collaboration system. In an Exchange organization, these people and resources are referred to as *recipients*. A recipient is any mail-enabled object in Active Directory to which Microsoft Exchange can deliver or route messages.

Exchange recipient types

Exchange includes several explicit recipient types. Each recipient type is identified in the Exchange admin center (EAC) and has a unique value in the *RecipientTypeDetails* property in the Exchange Management Shell. The use of explicit recipient types has the following benefits:

- At a glance, you can differentiate between various recipient types.
- You can search and sort by each recipient type.
- You can more easily perform bulk management operations for selected recipient types.
- You can more easily view recipient properties because the EAC uses the recipient types to render different property pages. For example, the resource capacity is displayed for a room mailbox, but isn't present for a user mailbox.

The following table lists the available recipient types. All these recipient types are discussed in more detail later in this topic.

RECIPIENT TYPE	DESCRIPTION
Dynamic distribution group	A distribution group that uses recipient filters and conditions to derive its membership at the time messages are sent.
Equipment mailbox	A resource mailbox that's assigned to a resource that's not location-specific, such as a portable computer, projector, microphone, or a company car. Equipment mailboxes can be included as resources in meeting requests, providing a simple and efficient way of using resources for your users.
Linked mailbox	A mailbox that's assigned to an individual user in a separate, trusted forest.
Mail contact	A mail-enabled Active Directory contact that contains information about people or organizations that exist outside the Exchange organization. Each mail contact has an external email address. All messages sent to the mail contact are routed to this external email address.
Mail forest contact	A mail contact that represents a recipient object from another forest. Mail forest contacts are typically created by Microsoft Identity Integration Server (MIIS) synchronization. **Note**: Mail forest contacts are read-only recipient objects that are updated only through MIIS or similar custom synchronization. You can't use the EAC or the Exchange Management Shell to remove or modify a mail forest contact.

RECIPIENT TYPE	DESCRIPTION
Mail user	A mail-enabled Active Directory user that represents a user outside the Exchange organization. Each mail user has an external email address. All messages sent to the mail user are routed to this external email address. A mail user is similar to a mail contact, except that a mail user has Active Directory logon credentials and can access resources.
Mail-enabled non-universal group	A mail-enabled Active Directory global or local group object. Mail-enabled non-universal groups were discontinued in Exchange Server 2007 and can exist only if they were migrated from Exchange 2003 or earlier versions of Exchange. You can't use Exchange Server 2013 to create non-universal distribution groups.
Mail-enabled public folder	An Exchange public folder that's configured to receive messages.
Distribution groups	A distribution group is a mail-enabled Active Directory distribution group object that can be used only to distribute messages to a group of recipients.
Mail-enabled security group	A mail-enabled security group is an Active Directory universal security group object that can be used to assign access permissions to resources in Active Directory and can also be used to distribute messages.
Microsoft Exchange recipient	A special recipient object that provides a unified and well-known message sender that differentiates system-generated messages from other messages. It replaces the System Administrator sender used for system-generated messages in earlier versions of Exchange.
Room mailbox	A resource mailbox that's assigned to a meeting location, such as a conference room, auditorium, or training room. Room mailboxes can be included as resources in meeting requests, providing a simple and efficient way of organizing meetings for your users.
Shared mailbox	A mailbox that's not primarily associated with a single user and is generally configured to allow access for multiple users.
Site mailbox	A mailbox comprised of an Exchange mailbox to store email messages and a SharePoint site to store documents. Users can access both email messages and documents using the same client interface. For more information, see Site mailboxes.
User mailbox	A mailbox that's assigned to an individual user in your Exchange organization. It typically contains messages, calendar items, contacts, tasks, documents, and other important business data.
Microsoft 365 or Office 365 mailbox	In hybrid deployments, a Microsoft 365 or Office 365 mailbox consists of a mail user that exists in Active Directory on-premises and an associated cloud mailbox that exists in Exchange Online.

RECIPIENT TYPE	DESCRIPTION
Linked user	A linked user is a user whose mailbox resides in a different forest than the forest in which the user resides.

Mailboxes

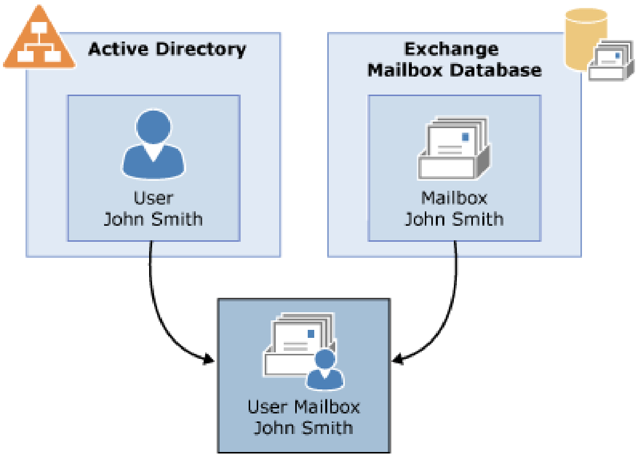
Mailboxes are the most common recipient type used by information workers in an Exchange organization. Each mailbox is associated with an Active Directory user account. The user can use the mailbox to send and receive messages, and to store messages, appointments, tasks, notes, and documents. Mailboxes are the primary messaging and collaboration tool for the users in your Exchange organization.

Mailbox components

Each mailbox consists of an Active Directory user and the mailbox data that's stored in the Exchange mailbox database (as shown in the following figure). All configuration data for the mailbox is stored in the Exchange attributes of the Active Directory user object. The mailbox database contains the actual data that's in the mailbox associated with the user account.

> **IMPORTANT**
>
> When you create a mailbox for a new or existing user, the Exchange attributes required for a mailbox are added to the user object in Active Directory. The associated mailbox data isn't created until the mailbox either receives a message or the user signs in to it.

Mailbox components



Caution

If you remove a mailbox, the mailbox data stored in the Exchange mailbox database is marked for deletion and the associated user account is also deleted from Active Directory. To retain the user account and delete only the mailbox data, you must disable the mailbox.

Mailbox types

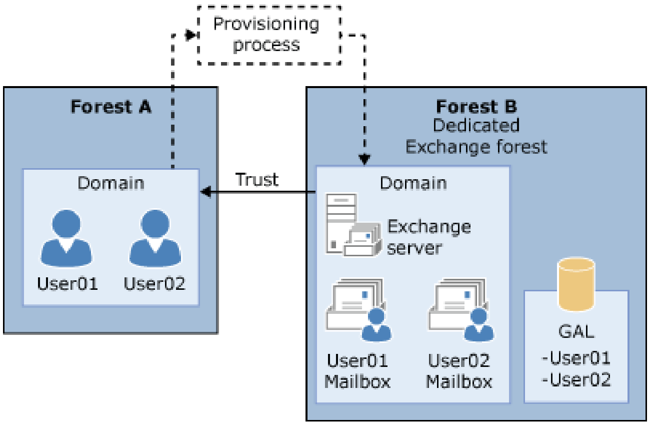
Exchange supports the following mailbox types:

- **User mailboxes**: User mailboxes are assigned to individual users in your Exchange organization. User mailboxes provide your users with a rich collaboration platform. Users can send and receive messages, manage their contacts, schedule meetings, and maintain a task list. They can also have voice mail messages delivered to their mailboxes. User mailboxes are the most commonly used mailbox type and are typically the mailbox type assigned to users in your organization.
- **Linked mailboxes**: Linked mailboxes are mailboxes that are accessed by users in a separate, trusted forest. Linked mailboxes may be necessary for organizations that deploy Exchange in a resource forest. The resource forest scenario allows an organization to centralize Exchange in a single forest, while

allowing access to the Exchange organization with user accounts in one or more trusted forests.

As stated earlier, every mailbox must have a user account associated with it. However, the user account that accesses the linked mailbox doesn't exist in the forest where Exchange is deployed. Therefore, a disabled user account that exists in the same forest as Exchange is associated with each linked mailbox. The following figure illustrates the relationship between the linked user account used to access the linked mailbox and the disabled user account in the Exchange resource forest associated with the linked mailbox.

Linked mailbox



- **Microsoft 365 or Office 365 mailboxes**: When you create a Microsoft 365 or Office 365 mailbox in Exchange Online in a hybrid deployment, the mail user is created in Active Directory on-premises. Directory synchronization, if it's configured, automatically synchronizes this new user object to Microsoft 365 or Office 365, where it's converted to a cloud mailbox in Exchange Online. You can create Microsoft 365 or Office 365 mailboxes as regular user mailboxes, resource mailboxes for meeting rooms and equipment, and shared mailboxes.

- **Shared mailboxes**: Shared mailboxes aren't primarily associated with individual users and are generally configured to allow access by multiple users.

  Although it's possible to assign additional users the logon access permissions to any mailbox type, shared mailboxes are dedicated for this functionality. The Active Directory user associated with a shared mailbox must be a disabled account. After you create a shared mailbox, you must assign permissions to all users that require access to the shared mailbox.

- **Resource mailboxes**: Resource mailboxes are special mailboxes designed to be used for scheduling resources. Like all mailbox types, a resource mailbox has an associated Active Directory user account, but it must be a disabled account. The following are the types of resource mailboxes:

  - **Room mailboxes**: These mailboxes are assigned to meeting locations, such as conference rooms, auditoriums, and training rooms.

  - **Equipment mailboxes**: These mailboxes are assigned to resources that aren't location-specific, such as portable computers, projectors, microphones, or company cars.

    You can include both types of resource mailboxes in meeting requests, providing a simple and efficient way for your users to use resources. You can configure resource mailboxes to automatically process incoming meeting requests based on the resource booking policies that are defined by the resource owners. For example, you can configure a conference room to automatically accept incoming meeting requests except recurring meetings, which can be subject to approval by the resource owner.

System mailboxes

System mailboxes are created by Exchange in the root domain of the Active Directory forest during installation. Users or administrators can't sign in to these mailboxes. System mailboxes are created for Exchange features such as Unified Messaging (UM), migration, message approval, and In-Place eDiscovery. This table lists information about system mailboxes as they're displayed in Active Directory.

> **NOTE**
>
> Unified Messaging is not available in Exchange 2019

MAILBOX	NAME
Organization	SystemMailbox {bb558c35-97f1-4cb9-8ff7-d53741dc928c}
Message approval	SystemMailbox {1f05a927-*xxxx-xxxx-xxxx-xxxxxxxxxxxx*} where *xxxx-xxxx-xxxx-xxxxxxxxxxxx* is a randomly assigned and unique GUID for each Exchange forest
UM data storage	SystemMailbox {e0dc1c29-89c3-4034-b678-e6c29d823ed9} This mailbox exists in Exchange 2016, not in Exchange 2019
Discovery	DiscoverySearchMailbox {D919BA05-46A6-415f-80AD-7E09334BB852}
Federated email	FederatedEmail.4c1f4d8b-8179-4148-93bf-00a95fa1e042
Migration	Migration.8f3e7716-2011-43e4-96b1-aba62d229136

If you want to decommission the last Mailbox server in your Exchange organization, you should first disable these system mailboxes by using the Disable-Mailbox cmdlet. When you decommission a Mailbox server that contains these system mailboxes, you should move the system mailboxes to another Mailbox server to make sure that you don't lose functionality.

Planning for mailboxes

Mailboxes are created in mailbox databases on Exchange servers that have the Mailbox server role installed. To help provide a reliable and effective platform for your mailbox users, detailed planning for the deployment of Mailbox servers and databases is essential. To learn more about planning for Mailbox servers and databases, see Planning and deployment.

Distribution groups

Distribution groups are mail-enabled Active Directory group objects that are primarily used for distributing messages to multiple recipients. Any recipient type can be a member of a distribution group.

> **IMPORTANT**
>
> Note the terminology differences between Active Directory and Exchange. In Active Directory, a distribution group refers to any group that doesn't have a security context, whether it's mail-enabled or not. In Exchange, all mail-enabled groups are referred to as distribution groups, whether they have a security context or not.

Exchange supports the following types of distribution groups:

- **Distribution groups**: These are Active Directory universal distribution group objects that are mail-enabled. They can be used only to distribute messages to a group of recipients.
- **Mail-enabled security groups**: These are Active Directory universal security group objects that are mail-enabled. They can be used to assign access permissions to resources in Active Directory and can also be used to distribute messages.

- **Mail-enabled non-universal groups**: These are Active Directory global or local group objects that are mail-enabled. You can create or mail-enable only universal distribution groups. You may have mail-enabled groups that were migrated from previous versions of Exchange that aren't universal groups. These groups can still be managed by using the EAC or the Exchange Management Shell.

> **NOTE**
>
> To convert a domain-local or a global group to a universal group, you can use the Set-Group cmdlet in the Exchange Management Shell.

Dynamic distribution groups

Dynamic distribution groups are distribution groups whose membership is based on specific recipient filters rather than a defined set of recipients.

Unlike regular distribution groups, the membership list for dynamic distribution groups is calculated each time a message is sent to them, based on the filters and conditions that you specify. When an email message is sent to a dynamic distribution group, it's delivered to all recipients in the organization that match the criteria defined for that dynamic distribution group.

> **IMPORTANT**
>
> A dynamic distribution group includes any recipient in Active Directory that has attributes that match the group's filter at the time a message is sent. If a recipient's properties are modified to match the group's filter, that recipient could inadvertently become a group member and start receiving messages that are sent to the dynamic distribution group. Well-defined, consistent account provisioning processes can reduce the chances of this issue occurring.

To help you create recipient filters for dynamic distribution groups, you can use precanned filters. A *precanned filter* is a commonly used filter that you can use to meet a variety of recipient-filtering criteria. You can use these filters to specify the recipient types that you want to include in a dynamic distribution group. In addition, you can also specify a list of conditions that the recipients must meet. You can create precanned conditions based on the following properties:

- Custom attributes 1-15
- State or province
- Company
- Department
- Recipient container

You can also specify conditions based on recipient properties other than those previously listed. To do this, you must use the Exchange Management Shell to create a custom query for the dynamic distribution group. Remember that the filter and condition settings for dynamic distribution groups that have custom recipient filters can be managed only by using the Exchange Management Shell. For an example of how to create a dynamic distribution group by using a custom query, see Manage dynamic distribution groups.

Mail contacts

Mail contacts typically contain information about people or organizations that exist outside your Exchange organization. Mail contacts can appear in your organization's shared address book (also called the global address list or GAL) and other address lists, and can be added as members to distribution groups. Each contact has an external email address, and all email messages that are sent to a contact are automatically forwarded to that address. Contacts are ideal for representing people external to your Exchange organization (in the shared address book) who don't need access to any internal resources. The following are mail contact types:

- **Mail contacts**: These are mail-enabled Active Directory contacts that contain information about people or organizations that exist outside your Exchange organization.
- **Mail forest contacts**: These represent recipient objects from another forest. These contacts are typically created by directory synchronization. Mail forest contacts are read-only recipient objects that can be updated or removed only by means of synchronization. You can't use Exchange management interfaces to modify or remove a mail forest contact.

Mail users

Mail users are similar to mail contacts. Both have external email addresses, both contain information about people outside your Exchange organization, and both can be displayed in the shared address book and other address lists. However, unlike a mail contact, mail users have Active Directory logon credentials and can access resources to which they are assigned permissions.

If a person external to your organization requires access to resources on your network, you should create a mail user instead of a mail contact. For example, you may want to create mail users for short-term consultants who require access to your server infrastructure, but who will use their own external addresses.

Another scenario is to create mail users in your organization for users who you don't want to maintain an Exchange mailbox. For example, after an acquisition, the acquired company may maintain their separate messaging infrastructure, but may also need access to resources on your network. For those users, you may want to create mail users instead of mailbox users.

> **NOTE**
>
> In the EAC, you use the **Recipients** > **Contacts** page to create and manage mail users. There isn't a separate page for mail users.

Mail-enabled public folders

Public folders are intended to serve as a repository for information shared among many users. Mail-enabling a public folder provides an extra level of functionality to users. In addition to being able to post messages to the folder, users can send email messages to, and sometimes receive email messages from, the public folder. Each mail-enabled folder has an object in Active Directory that stores its email address, address book name, and other mail-related attributes.

You can manage public folders by using either the EAC or the Exchange Management Shell. For more information about managing public folders, see Public folders.

Microsoft Exchange recipient

The Microsoft Exchange recipient is a special recipient object that provides a unified and well-known message sender that differentiates system-generated messages from other messages. It replaces the System Administrator sender that was used for system-generated messages in earlier versions of Exchange.

The Microsoft Exchange recipient isn't a typical recipient object, such as a mailbox, mail user, or mail contact, and it isn't managed by using the typical recipient tools. However, you can use the Set-OrganizationConfig cmdlet in the Exchange Management Shell to configure the Microsoft Exchange recipient.

> **NOTE**
>
> When system-generated messages are sent to an external sender, the Microsoft Exchange recipient isn't used as the sender of the message. Instead, the email address specified by the *ExternalPostmasterAddress* parameter in the Set-TransportConfig cmdlet is used.

Recipients documentation

The following table contains links to topics that will help you learn about and manage Exchange recipients.

TOPIC	DESCRIPTION
Create user mailboxes in Exchange Server	Learn how to create user mailboxes using the Exchange admin center or the Exchange Management Shell.
Manage user mailboxes	Learn how to create user mailboxes, change mailbox properties, and bulk-edit selected properties for multiple mailboxes.
Manage distribution groups	Learn how to create and manage distribution groups, and create a group naming policy for your organization.
Manage dynamic distribution groups	Learn how to create dynamic distribution groups and manage dynamic distribution group properties, such as using custom attributes and other properties to determine group membership.
Manage mail contacts	Learn how to create and manage mail contacts.
Manage mail users	Learn how to create and manage mail users.
Create and manage room mailboxes	Learn how to create room mailboxes and manage room mailbox properties, such as enabling recurring meetings and configuring booking and scheduling options.
Manage equipment mailboxes	Learn how to create equipment mailboxes, configure booking and scheduling options, and manage other mailbox properties.
Disconnected mailboxes	Learn about the two types of disconnected mailboxes and how to work with them.
Custom attributes	Learn how to add information about a recipient by using custom attributes.
Filters in recipient Shell commands	Learn how to use precanned or custom filters with commands to filter a set of recipients.
Manage permissions for recipients	Learn how to use the EAC or the Exchange Management Shell to assign permissions to users and groups.
Automatic Mailbox Distribution	Learn about how automatic mailbox distribution works and how to control which mailbox databases are selected for new and moved mailboxes.

Create user mailboxes in Exchange Server

8/3/2020 • 8 minutes to read • Edit Online

User mailboxes are Exchange mailboxes that are associated with people, typically one mailbox per person. Each user mailbox has an associated Active Directory account that gives the person access to the mailbox to send and receive email messages, and create meetings and appointments.

When you create a new user mailbox in Exchange, you also create the corresponding Active Directory user at the same time. Or, you can create a new mailbox for an existing Active Directory account that doesn't have an associated mailbox. This is known as *mailbox-enabling* an existing user.

You can create user mailboxes in Exchange Server by using the Exchange admin center (EAC) or the Exchange Management Shell. The following table describes some of the important properties for user mailboxes.

PROPERTY	REQUIRED OR OPTIONAL	DESCRIPTION
Alias	Optional	The Exchange alias (also known as the *mail nickname*) for the mailbox. The maximum length is 64 characters. Valid characters are letters, numbers and ASCII text characters that are allowed in email addresses. For example, periods are allowed, but each period must be surrounded by other valid characters (for example, pilar.pinilla). The alias value is used to generate the primary email address (*<alias>*@*<domain>*). If you don't specify an alias value, the username part of the account name (user principal name) is used. The alias value must be unique. **Note**: Don't use apostrophes (') or quotation marks (") in the alias. Although these characters are allowed, they might cause problems later.
Display name	EAC: Required Exchange Management Shell: Optional	Identifies the mailbox in the EAC, and in address lists in Outlook and Outlook on the web (formerly known as Outlook Web App). The maximum length is 256 characters. Spaces and other text characters are allowed. In the EAC, the display name is populated by the values that you enter for the first name, middle initial, and last name, but you can specify a custom value. In the Exchange Management Shell, if you don't specify a value for the display name, the value of the **Name** property is used. The display name value doesn't need to be unique, but having multiple mailboxes with the same display name would be confusing.

PROPERTY	REQUIRED OR OPTIONAL	DESCRIPTION
Name	Required	Specifies the name of the object in Active Directory. Only administrators see this value in Exchange or Active Directory management tools. The maximum length is 64 characters. Spaces and other text characters are allowed. The name value must be unique.

What do you need to know before you begin?

- Estimated time to complete each user mailbox task: 2 to 5 minutes.
- For more information about the EAC, see Exchange admin center in Exchange Server. To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

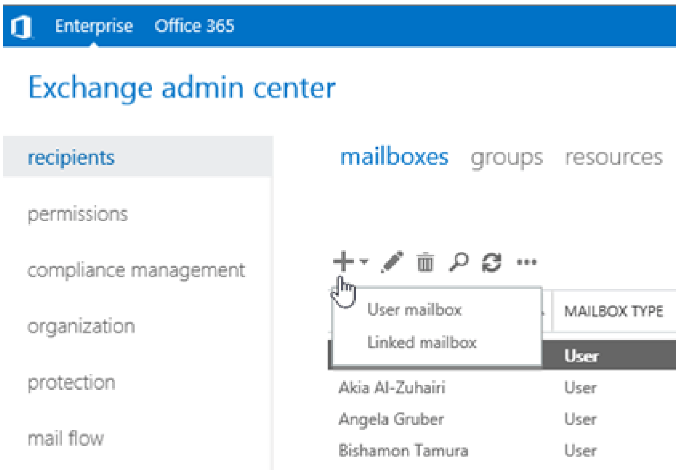
> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Create user mailboxes

The procedures in this section describe how to create a new mailbox and the associated Active Directory user account.

Use the EAC to create user mailboxes

1. In the EAC, go to **Recipients** > **Mailboxes**.
2. Click **New** (+) and then select **User mailbox**.



Note: A linked mailbox is a local mailbox that's associated with a user account in a different (trusted) Active Directory forest. For more information, see Manage linked mailboxes.

3. On the **New user mailbox** page, configure the following settings. Settings marked with an asterisk (*) are required.

   - **Alias**
   - **Existing user** or **New user**: Select **New user**.
   - **First name**
   - **Initials**
   - **Last name**
   - *** Display name**: By default, this field is populated with the names you enter in the **First name**, **Initials**, and **Last name** fields, but you can override it. The maximum length is 256 characters.
   - *** Name**: By default, this field is populated with the names you enter in the **First name**, **Initials**, and **Last name** field, but you can override it. The maximum length is 64 characters, and the value must be unique in your organization.
   - **Organizational unit**: Typically, the default location for the user account is the Users container. To change it, click **Browse** and select the OU or container where you want to create the account.
   - *** User logon name**: This is the Active Directory user account that's created and associated with the mailbox.

   Notes:

   - Don't use apostrophes (') or quotation marks ("). Although these characters are allowed, they might cause problems later (for example, assigning access permissions to the mailbox).
   - If this value is different than the **Alias** value, the user's email address and account name will be different (important if the email domain and the Active Directory domain are the same).
   - *** New Password**: Verify the value complies with your organization's password length, complexity, and history requirements.
   - *** Confirm password**
   - **Require password change on next logon**: Select this check box to force the user to change the initial password when they first sign in to the mailbox.

4. You can click **Save** to create the mailbox and the associated Active Directory user account, or you can click **More options** to configure the following additional settings:

   - **Mailbox database**: Click **Browse** to select the mailbox database that holds the mailbox.
   - **Create an on-premises archive mailbox for this user**: Select this check box to create an archive mailbox for the mailbox, and then click **Browse** to select the mailbox database that holds the archive mailbox. Items are automatically moved from the primary mailbox to the archive based on the retention policy settings. For more information, see In-Place Archiving in Exchange Server.
   - **Address book policy**: ABPs define a global address list (GAL), an offline address book (OAB), a room list, and a set of address lists. An ABP gives the user access to a customized GAL in Outlook and Outlook on the web. For more information, see Address book policies in Exchange Server.

   When you're finished, click **Save**.

Use the Exchange Management Shell to create user mailboxes

To create a user mailbox in the Exchange Management Shell, use the following syntax:

```
New-Mailbox -Name <Name> -UserPrincipalName <UPN> -Password (ConvertTo-SecureString -String '<Password>' -
AsPlainText -Force) [-Alias <Alias>] [-FirstName <FirstName>] [-LastName <LastName>] [-DisplayName
<DisplayName>] -[OrganizationalUnit <OU>]
```

This example creates a new mailbox and Active Directory user account for Pilar Pinilla with the following settings:

- **Required parameters**:
  - *Name*: Pilar Pinilla. This value is also used for the display name, because we aren't using the *DisplayName* parameter.
  - *UserPrincipalName*: The Active Directory account name is `pilarp@contoso.com`.
  - *Password*: `Pa$$word1`
- **Optional parameters**:
  - *FirstName*: Pilar
  - *LastName*: Pinilla
  - The alias value is `pilarp` because we aren't using the *Alias* parameter, and `pilarp` is taken from the *UserPrincipalName* parameter value.

```
New-Mailbox -Name "Pilar Pinilla" -UserPrincipalName pilarp@contoso.com -Password (ConvertTo-SecureString -
String 'Pa$$word1' -AsPlainText -Force) -FirstName Pilar -LastName Pinilla
```

For detailed syntax and parameter information, see New-Mailbox.

How do you know this worked?

To verify that you've successfully created a user mailbox, use either of the following procedures:

- In the EAC, go to **Recipients** > **Mailboxes**, and verify the mailbox is displayed in the list.
- In the Exchange Management Shell, replace *<Name>* with the *Name* parameter value that you used, and run the following command:

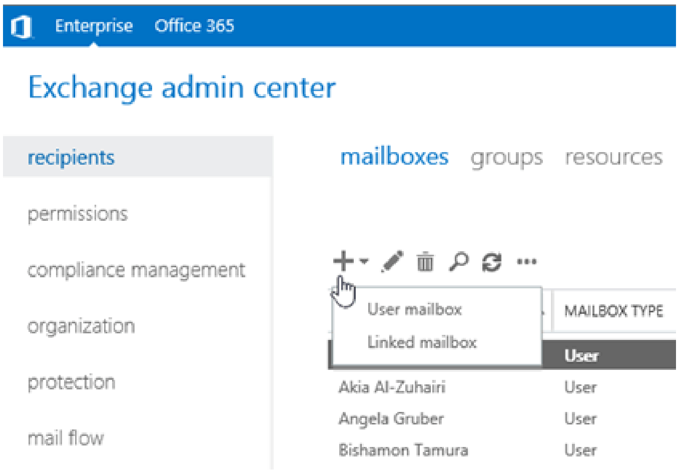
  ```
  Get-Mailbox -Identity <Name> | Format-List Name,DisplayName,Alias,PrimarySmtpAddress,Database
  ```

Create mailboxes for existing user accounts

When you mailbox-enable a user account, you can only select existing Active Directory users that aren't already mail-enabled (no mail users or accounts that already have an associated mailbox).

Use the EAC to create mailboxes for existing user accounts

1. In the EAC, go to **Recipients** > **Mailboxes**.
2. Click **New** (+) and then select **User mailbox**.



3. On the **New user mailbox** page, configure the following settings.

   - **Alias**: This setting is optional.

     Notes:

     - Don't use apostrophes (') or quotation marks ("). Although these characters are allowed, they might cause problems later.

     - If this value is different than the username part of the user principal name, the user's email address and account name will be different (important if the email domain and the Active Directory domain are the same).

   - **Existing user** or **New user**: Verify **Existing user** is selected, and then click **Browse** to select an available account.

4. You can click **Save** to create the mailbox, or you can click **More options** to configure the following additional settings:

   - **Mailbox database**: Click **Browse** to select the mailbox database that holds the mailbox.

   - **Create an on-premises archive mailbox for this user**: Select this check box to create an archive mailbox for the mailbox, and then click **Browse** to select the mailbox database that holds the archive mailbox. Items are automatically moved from the primary mailbox to the archive based on the retention policy settings. For more information, see In-Place Archiving in Exchange Server.

   - **Address book policy**: ABPs define a global address list (GAL), an offline address book (OAB), a room list, and a set of address lists. An ABP gives the user access to a customized GAL in Outlook and Outlook on the web. For more information, see Address book policies in Exchange Server.

   When you're finished, click **Save**.

Use the Exchange Management Shell to create mailboxes for existing user accounts

To create a mailbox for an existing user account, use the following syntax:

```
Enable-Mailbox -Identity <Account> [-Alias <Alias>] [-DisplayName <DisplayName>] [-Database <Database>]
```

This example creates a mailbox in the mailbox database named UsersMailboxDatabase for the existing user named Kathleen Reiter, whose account name (user principal name) is kreiter@contoso.com.

- Because we aren't using the *Alias* parameter, the alias value is `kreiter`.

- Because we aren't using the *DisplayName* parameter, the value of the **name** attribute in Active Directory is used as the display name.

```
Enable-Mailbox -Identity kreiter@contoso.com -Database UsersMailboxDatabase
```

This example finds all user accounts that aren't mail-enabled and that aren't system accounts (the **userPrincipalName** attribute isn't blank), and then creates mailboxes for those accounts.

```
Get-User -RecipientTypeDetails User -Filter "UserPrincipalName -ne `$null" -ResultSize unlimited | Enable-Mailbox
```

For detailed syntax and parameter information, see Enable-Mailbox and Get-User.

How do you know this worked?

To verify that you've successfully created a mailbox for an existing user, use either of the following procedures:

- In the EAC, go to **Recipients** > **Mailboxes** and verify the mailbox is displayed in the list.
- In the Exchange Management Shell, replace *<Name>* with the name attribute of the user, and run the following command:

  ```
  Get-Mailbox -Identity <Name> | Format-List Name,DisplayName,Alias,PrimarySmtpAddress,Database
  ```

Manage user mailboxes

8/3/2020 • 23 minutes to read • Edit Online

After you create a user mailbox, you can make changes and set additional properties by using the EAC or the Exchange Management Shell.

You can also change properties for multiple user mailboxes at the same time. For more information, see Use the EAC to bulk edit user mailboxes.

What do you need to know before you begin?

- Estimated time to complete each user mailbox task: 2 to 5 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Change user mailbox properties

Use the EAC to change user mailbox properties

1. In the EAC, navigate to **Recipients** > **Mailboxes**.
2. In the list of user mailboxes, click the mailbox that you want to change the properties for, and then click **Edit** ✏.
3. On the mailbox properties page, click one of the following sections to view or change properties.
    - General
    - Mailbox Usage
    - Contact Information
    - Organization
    - Email Address
    - Mailbox Features
    - Member Of
    - MailTip
    - Mailbox Delegation

General

Use the **General** section to view or change basic information about the user.

- **First name**, **Initials**, **Last name**

- *** Name**: This is the name that's listed in Active Directory. If you change this name, it can't exceed 64 characters.

- *** Display name**: This name appears in your organization's address book, on the To: and From: lines in email, and in the Mailbox list. This name can't contain empty spaces before or after the display name.

- *** Alias**: This specifies the email alias for the user. The user's alias is the portion of the email address on the left side of the at (@) symbol. It must be unique in the forest.

- *** User logon name**: This is the name that the user uses to sign in to their mailbox and to log on to the domain. Typically the user logon name consists of the user's alias on the left side of the @ symbol, and the domain name in which the user account resides on the right side of the @ symbol.

- **Require password change on next logon**: Select this check box if you want the user to reset their password the next time they sign in to their mailbox.

- **Hide from address lists**: Select this check box to prevent the recipient from appearing in the address book and other address lists that are defined in your Exchange organization. After you select this check box, users can still send messages to the recipient by using the email address.

Click **More options** to view or change these additional properties:

- **Organizational unit**: This read-only box displays the organizational unit (OU) that contains the user account. You have to use Active Directory Users and Computers to move the user account to a different OU.

- **Mailbox database**: This read-only box displays the name of the mailbox database that hosts the mailbox. To move the mailbox to a different database, select it in the mailbox list, and then click **Move mailbox to another database** in the Details pane.

- **Custom attributes**: This section displays the custom attributes defined for the user mailbox. To specify custom attribute values, click **Edit**. You can specify up to 15 custom attributes for the recipient.

Mailbox Usage

Use the **Mailbox Usage** section to view or change the mailbox storage quota and deleted item retention settings for the mailbox. These settings are configured by default when the mailbox is created. They use the values that are configured for the mailbox database and apply to all mailboxes in that database. You can customize these settings for each mailbox instead of using the mailbox database defaults.

- **Last logon**: This read-only box displays the last time that the user signed in to their mailbox.

- **Mailbox usage**: This area shows the total size of the mailbox and the percentage of the total mailbox quota that has been used.

> **NOTE**
>
> To obtain the information that's displayed in the previous two boxes, the EAC queries the mailbox database that hosts the mailbox. If the EAC is unable to communicate with the Exchange store that contains the mailbox database, these boxes will be blank. A warning message is displayed if the user hasn't signed in to the mailbox for the first time.

Click **More options** to view or change the mailbox storage quota and the deleted item retention settings for the mailbox.

- **Storage quota settings**: To customize these settings for the mailbox and not use the mailbox database defaults, click **Customize the settings for this mailbox**, type a new value, and then click **Save**.

  The value range for any of the storage quota settings is from 0 through 2047 gigabytes (GB).

    - **Issue a warning at (GB)**: This box displays the maximum storage limit before a warning is issued to the user. If the mailbox size reaches or exceeds the value specified, Exchange sends a warning message to the user.

    - **Prohibit send at (GB)**: This box displays the *prohibit send* limit for the mailbox. If the mailbox size reaches or exceeds the specified limit, Exchange prevents the user from sending new messages and displays a descriptive error message.

    - **Prohibit send and receive at (GB)**: This box displays the *prohibit send and receive* limit for the mailbox. If the mailbox size reaches or exceeds the specified limit, Exchange prevents the mailbox user from sending new messages and won't deliver any new messages to the mailbox. Any messages sent to the mailbox are returned to the sender with a descriptive error message.

- **Deleted item retention settings**: To customize these settings for the mailbox and not use the mailbox database defaults, click **Customize the settings for this mailbox**, type a new value, and then click **Save**.

    - **Keep deleted items for (days)**: This box displays the length of time that deleted items are retained before they are permanently deleted and can't be recovered by the user. When the mailbox is created, this value is based on the deleted item retention settings configured for the mailbox database. By default, a mailbox database is configured to retain deleted items for 14 days. The value range for this property is from 0 through 24855 days.

    - **Don't permanently delete items until the database is backed up**: Select this check box to prevent mailboxes and email messages from being deleted until after the mailbox database on which the mailbox is located has been backed up.

Contact Information

Use the **Contact Information** section to view or change the user's contact information. The information on this page is displayed in the address book. Click **More options** to display additional boxes.

> **TIP**
>
> You can use the **State/Province** box to create recipient conditions for dynamic distribution groups, email address policies, or address lists.

Mailbox users can use Outlook or Outlook on the web (formerly known as Outlook Web App) to view and change their own contact information. But they can't change the information in the **Notes** and **Web page** boxes.

Organization

Use the **Organization** section to record detailed information about the user's role in the organization. This information is displayed in the address book. Also, you can create a virtual organization chart that is accessible from email clients such as Outlook.

- **Title**: Use this box to view or change the recipient's title.

- **Department**: Use this box to view or change the department in which the user works. You can use this box to create recipient conditions for dynamic distribution groups, email address policies, or address lists.

- **Company**: Use this box to view or change the company for which the user works. You can use this box to create recipient conditions for dynamic distribution groups, email address policies, or address lists.

- **Manager**: To add a manager, click **Browse**. In **Select Manager**, select a person, and then click **OK**.

- **Direct reports**: You can't modify this box. A *direct report* is a user who reports to a specific manager. If you've specified a manager for the user, that user appears as a direct report in the details of the manager's mailbox. For example, Kari manages Chris and Kate, so Kari's mailbox is specified in the **Manager** box of Chris's mailbox and Kate's mailbox, and Chris and Kate appear in the **Direct reports** box in the properties of Kari's mailbox.

Email Address

Use the **Email Address** section to view or change the email addresses associated with the user mailbox. This includes the user's primary SMTP address and any associated proxy addresses. The primary SMTP address (also known as the *default reply address*) is displayed in bold text in the address list, with the uppercase **SMTP** value in the **Type** column.

- **Add**: Click **Add** + to add a new email address for this mailbox. Select one of following address types:
  - **SMTP**: This is the default address type. Click this button and then type the new SMTP address in the *** Email address** box.
  - **EUM**: An EUM (Exchange Unified Messaging) address is used by the Microsoft Exchange Unified Messaging service in Exchange 2016 to locate UM-enabled users within an Exchange organization. EUM addresses consist of the extension number and the UM dial plan for the UM-enabled user. Click this button and type the extension number in the **Address/Extension** box. Then click **Browse** and select a dial plan for the user. (**Note**: Unified Messaging is not available in Exchange 2019.)
  - **Custom address type**: Click this button and type one of the supported non-SMTP email address types in the *** Email address** box.

    > **NOTE**
    >
    > With the exception of X.400 addresses, Exchange doesn't validate custom addresses for proper formatting. You must make sure that the custom address you specify complies with the format requirements for that address type.

  - **Make this the reply address**: In Exchange Online, you can select this check box to make the new email address the primary SMTP address for the mailbox. This check box isn't available in the EAC in Exchange Server.
- **Automatically update email addresses based on the email address policy applied to this recipient**: Select this check box to have the recipient's email addresses automatically updated based on changes made to email address policies in your organization. This box is selected by default.

Mailbox Features

Use the **Mailbox Features** section to view or change the following mailbox features and settings:

- **Sharing policy**: This box shows the sharing policy applied to the mailbox. A sharing policy controls how users in your organization can share calendar and contact information with users outside your Exchange organization. The Default Sharing Policy is assigned to mailboxes when they are created. To change the sharing policy that's assigned to the user, select a different one from the drop-down list.
- **Role assignment policy**: This box shows the role assignment policy assigned to the mailbox. The role assignment policy specifies the role-based access control (RBAC) roles that are assigned to the user and control what specific mailbox and distribution group configuration settings users can modify. To change the role assignment policy that's assigned to the user, select a different one from the drop-down list.
- **Retention policy**: This box shows the retention policy assigned to the mailbox. A retention policy is a group of retention tags that are applied to the user's mailbox. They allow you to control how long to keep items in users' mailboxes and define what action to take on items that have reached a certain age. A retention policy isn't assigned to mailboxes when they are created. To assign a retention policy to the user, select one from the drop-down list.
- **Address book policy**: This box shows the address book policy applied to the mailbox. An address book policy allows you to segment users into specific groups to provide customized views of the address book.

To apply or change the address book policy applied to the mailbox, select one from the drop-down list.

- **Unified Messaging (not available in Exchange 2019)**: This feature is disabled by default. When you enable Unified Messaging (UM) in Exchange 2016, the user will be able to use your organization's UM features and a default set of UM properties are applied to the user. Click **Enable** to enable UM for the mailbox. For information about how to enable UM, see Enable a User for Unified Messaging.

  > **NOTE**
  >
  > A UM dial plan and a UM mailbox policy must exist before you can enable UM.

- **Mobile Devices**: Use this section to view and change the settings for Exchange ActiveSync, which is enabled by default. Exchange ActiveSync enables access to an Exchange mailbox from a mobile device. Click **Disable Exchange ActiveSync** to disable this feature for the mailbox.

- **Outlook Web App**: This feature is enabled by default. Outlook on the web enables access to an Exchange mailbox from a web browser. Click **Disable** to disable Outlook on the web for the mailbox. Click **Edit details** to add or change an Outlook on the web mailbox policy for the mailbox.

- **IMAP**: This feature is enabled by default. Click **Disable** to disable IMAP for the mailbox.

- **POP3**: This feature is enabled by default. Click **Disable** to disable POP3 for the mailbox.

- **MAPI**: This feature is enabled by default. MAPI enables access to an Exchange mailbox from a MAPI client such as Outlook. Click **Disable** to disable MAPI for the mailbox.

- **Litigation hold**: This feature is disabled by default. Litigation hold preserves deleted mailbox items and records changes made to mailbox items. Deleted items and all instances of changed items are returned in a discovery search. Click **Enable** to put the mailbox on litigation hold. If the mailbox is on litigation hold, click **Disable** to remove the litigation hold. Mailboxes on litigation hold are inactive mailboxes and can't be deleted. To delete the mailbox, remove the litigation hold. If the mailbox is on litigation hold, click **Edit details** to view and change the following litigation hold settings:

  - **Hold date**: This read-only box indicates the date and time when the mailbox was put on litigation hold.

  - **Put on hold by**: This read-only box indicates the user who put the mailbox on litigation hold.

  - **Note**: Use this box to notify the user about the litigation hold, explain why the mailbox is on litigation hold, or provide additional guidance to the user, such as informing them that the litigation hold won't affect their day-to-day use of email.

  - **URL**: Use this box to provide a URL to a website that provides information or guidance about the litigation hold on the mailbox.

    > **NOTE**
    >
    > The text from these boxes appears in the user's mailbox only if they are using Outlook 2010 or later versions. It doesn't appear in Outlook on the web or other email clients. To view the text from the Note and URL boxes in Outlook, click the **File** tab, and on the **Info** page, under **Account Settings**, you'll see the litigation hold comment.

- **Archiving**: If an archive mailbox doesn't exist for the user, this feature is disabled. To enable an archive mailbox, click **Enable**. If the user has an archive mailbox, the size of the archive mailbox and usage statistics are displayed. Click **Edit details** to view and change the following archive mailbox settings:

  - **Status**: This read-only box indicates whether an archive mailbox exists.

    - **Database**: This read-only box shows the name of the mailbox database that hosts the archive mailbox.
    - **Name**: Type the name of the archive mailbox in this box. This name is displayed under the folder list in Outlook or Outlook on the web.
    - **Archive quota (GB)**: This box shows the total size of the archive mailbox. To change the size, type a new value in the box or select a value from the drop-down list.
    - **Issue warning at (GB)**: This box shows the maximum storage limit for the archive mailbox before a warning is issued to the user. If the archive mailbox size reaches or exceeds the value specified, Exchange sends a warning message to the user. To change this limit, type a new value in the box or select a value from the drop-down list.
- **Delivery Options**: Use to forward email messages sent to the user to another recipient and to set the maximum number of recipients that the user can send a message to. Click **View details** to view and change these settings.
    - **Forwarding address**: Select the **Enable forwarding** check box and then click **Browse** to display the **Select Mail User and Mailbox** page. Use this page to select a recipient to whom you want to forward all email messages that are sent to this mailbox.
    - **Deliver message to both forwarding address and mailbox**: Select this check box so that messages will be delivered to both the forwarding address and the user's mailbox.
    - **Recipient limit**: This setting controls the maximum number of recipients the user can send a message to. Select the **Maximum recipients** check box to limit the number of recipients allowed in the To:, Cc:, and Bcc: boxes of an email message and then specify the maximum number of recipients. For on-premises Exchange organizations, the recipient limit is unlimited.
- **Message Size Restrictions**: These settings control the size of messages that the user can send and receive. Click **View details** to view and change maximum size for sent and received messages.
    - **Sent messages**: To specify a maximum size for messages sent by this user, select the **Maximum message size (KB)** check box and type a value in the box. The message size must be between 0 and 2,097,151 KB. If the user sends a message larger than the specified size, the message will be returned to the user with a descriptive error message.
    - **Received messages**: To specify a maximum size for messages received by this user, select the **Maximum message size (KB)** check box and type a value in the box. The message size must be between 0 and 2,097,151 KB. If the user receives a message larger than the specified size, the message will be returned to the sender with a descriptive error message.
- **Message Delivery Restrictions**: These settings control who can send email messages to this user. Click **View details** to view and change these restrictions.
    - **Accept messages from**: Use this section to specify who can send messages to this user.
    - **All senders**: Select this option to specify that the user can accept messages from all senders. This includes both senders in your Exchange organization and external senders. This option is selected by default. This option includes external users only if you clear the **Require that all senders are authenticated** check box. If you select this check box, messages from external users will be rejected.
    - **Only senders in the following list**: Select this option to specify that the user can accept messages only from a specified set of senders in your Exchange organization. Click **Add** + to display the **Select Recipients** page, which displays a list of all recipients in your Exchange organization. Select the recipients you want, add them to the list, and then click **OK**. You can also search for a specific recipient by typing the recipient's name in the search box and then clicking **Search** 🔎.

  - **Require that all senders are authenticated**: Select this option to prevent anonymous users from sending messages to the user.

  - **Reject messages from**: Use this section to block people from sending messages to this user.

  - **No senders**: Select this option to specify that the mailbox won't reject messages from any senders in the Exchange organization. This option is selected by default.

  - **Senders in the following list**: Select this option to specify that the mailbox will reject messages from a specified set of senders in your Exchange organization. Click **Add** + to display the **Select Recipients** page, which displays a list of all recipients in your Exchange organization. Select the recipients you want, add them to the list, and then click **OK**. You can also search for a specific recipient by typing the recipient's name in the search box and then clicking **Search** 🔎.

Member Of

Use the **Member Of** section to view a list of the distribution groups or security groups to which this user belongs. You can't change membership information on this page. Note that the user may match the criteria for one or more dynamic distribution groups in your organization. However, dynamic distribution groups aren't displayed on this page because their membership is calculated each time they are used.

MailTip

Use the **MailTip** section to add a MailTip to alert users of potential issues if they send a message to this recipient. A MailTip is text that is displayed in the InfoBar when this recipient is added to the To, Cc, or Bcc boxes of a new email message.

> **NOTE**
>
> MailTips can include HTML tags, but scripts aren't allowed. The length of a custom MailTip can't exceed 175 displayed characters. HTML tags aren't counted in the limit.

Mailbox Delegation

Use the **Mailbox Delegation** section to assign permissions to other users (also called *delegates*) to allow them to sign in to the user's mailbox or send messages on behalf of the user. You can assign the following permissions:

- **Send As**: This permission allows users other than the mailbox owner to use the mailbox to send messages. After this permission is assigned to a delegate, any message that a delegate sends from this mailbox will appear as if it was sent by the mailbox owner. However, this permission doesn't allow a delegate to sign in to the user's mailbox.

- **Send on Behalf Of**: This permission also allows a delegate to use this mailbox to send messages. However, after this permission is assigned to a delegate, the **From:** address in any message sent by the delegate indicates that the message was sent by the delegate on behalf of the mailbox owner.

- **Full Access**: This permission allows a delegate to sign in to the user's mailbox and view the contents of the mailbox. However, after this permission is assigned to a delegate, the delegate can't send messages from the mailbox. To allow a delegate to send email from the user's mailbox, you still have to assign the delegate the Send As or the Send on Behalf Of permission.

To assign permissions to delegates, click **Add** + under the appropriate permission to display a page that displays a list of all recipients in your Exchange organization that can be assigned the permission. Select the recipients you want, add them to the list, and then click **OK**. You can also search for a specific recipient by typing the recipient's name in the search box and then clicking **Search** 🔎.

Use the Exchange Management Shell to change user mailbox properties

Use the **Get-Mailbox** and **Set-Mailbox** cmdlets to view and change properties for user mailboxes. One advantage of using the Exchange Management Shell is the ability to change the properties for multiple mailboxes.

For information about what parameters correspond to mailbox properties, see the following topics:

- Get-Mailbox
- Set-Mailbox

Here are some examples of using the Exchange Management Shell to change user mailbox properties.

This example shows how to forward Pat Coleman's email messages to Sunil Koduri's (sunilk@contoso.com) mailbox.

```
Set-Mailbox -Identity patc -DeliverToMailboxAndForward $true -ForwardingAddress sunilk@contoso.com
```

This example uses the **Get-Mailbox** command to find all user mailboxes in the organization, and then uses the **Set-Mailbox** command to set the recipient limit to 500 recipients allowed in the To:, Cc:, and Bcc: boxes of an email message.

```
Get-Mailbox -ResultSize unlimited -Filter "RecipientTypeDetails -eq 'UserMailbox'" | Set-Mailbox -
RecipientLimits 500
```

This example uses the **Get-Mailbox** command to find all the mailboxes in the Marketing organizational unit, and then uses the **Set-Mailbox** command to configure these mailboxes. The custom warning, prohibit send, and prohibit send and receive limits are set to 200 megabytes (MB), 250 MB, and 280 MB respectively, and the mailbox database's default limits are ignored. This command can be used to configure a specific set of mailboxes to have larger or smaller limits than other mailboxes in the organization.

```
Get-Mailbox -OrganizationalUnit "Marketing" | Set-Mailbox -IssueWarningQuota 209715200 -ProhibitSendQuota
262144000 -ProhibitSendReceiveQuota 293601280 -UseDatabaseQuotaDefaults $false
```

This example uses the **Get-Mailbox** cmdlet to find all users in the Customer Service department, and then uses the **Set-Mailbox** cmdlet to change the maximum message size for sending messages to 2 MB.

```
Get-Mailbox -Filter "Department -eq 'Customer Service'" | Set-Mailbox -MaxSendSize 2097152
```

This example sets the MailTip translation in French and Chinese.

```
Set-Mailbox john@contoso.com -MailTipTranslations ("FR: C'est la langue française", "CHT: 這是漢語語言")
```

How do you know this worked?

To verify that you've successfully changed properties for a user mailbox, do the following:

- In the EAC, select the mailbox and then click **Edit** ✎ to view the property or feature that you changed. Depending on the property that you changed, it might be displayed in the Details pane for the selected mailbox.

- In the Exchange Management Shell, use the **Get-Mailbox** cmdlet to verify the changes. One advantage of using the Exchange Management Shell is that you can view multiple properties for multiple mailboxes. In the example above where the recipient limit was changed, run the following command to verify the new value.

  ```
  Get-Mailbox -ResultSize unlimited -Filter "RecipientTypeDetails -eq 'UserMailbox'" | Format-List
  Name,RecipientLimits
  ```

For the example above where the message limits were changed, run this command.

```
Get-Mailbox -OrganizationalUnit "Marketing" | Format-List
Name,IssueWarningQuota,ProhibitSendQuota,ProhibitSendReceiveQuota,UseDatabaseQuotaDefaults
```

Bulk edit user mailboxes

You can use the EAC to change the properties for multiple user mailboxes. When you select two or more user mailboxes from the mailbox list in the EAC, the properties that can be bulk edited are displayed in the Details pane. When you change one of these properties, the change is applied to all selected mailboxes.

Here's a list of the user mailbox properties and features that can be bulk edited. Note that not all properties in each area are available to be changed.

- **Contact Information**: Change shared properties such as street, postal code, and city name.
- **Organization**: Change shared properties such as department name, company name, and the manager that the selected users report to.
- **Custom attributes**: Change or add values for custom attributes 1 - 15.
- **Mailbox quota**: Change the mailbox quota values and the retention period for deleted items.
- **Email connectivity**: Enable or disable Outlook on the web, POP3, IMAP, MAPI, and Exchange ActiveSync.
- **Archive**: Enable or disable the archive mailbox.
- **Retention policy, role assignment policy, and sharing policy**: Update the settings for each of these mailbox features.
- **Move mailboxes to another database**: Move the selected mailboxes to a different database.
- **Delegate permissions**: Assign permissions to users or groups that allow them to open or send messages from other mailboxes. You can assign Full, Send As and Send on Behalf permissions to users or groups. Check out Manage permissions for recipients for more details.

> **NOTE**
>
> The estimated time to complete this task is 2 minutes, but may take longer if you change multiple properties or features.

Use the EAC to bulk edit user mailboxes

1. In the EAC, navigate to **Recipients** > **Mailboxes**.
2. In the list of mailboxes, select two or more mailboxes.

   > **TIP**
   >
   > You can select multiple adjacent mailboxes by holding down the Shift key and clicking the first mailbox, and then clicking the last mailbox you want to edit. You can also select multiple non-adjacent mailboxes by holding down the Ctrl key and clicking each mailbox that you want to edit.

3. In the Details pane, under **Bulk Edit**, select the mailbox properties or feature that you want to edit.
4. Make the changes on the properties page and then save your changes.

How do you know this worked?

To verify that you've successfully bulk edited user mailboxes, do one of the following:

- In the EAC, select each of the mailboxes that you bulk edited and then click **Edit** ✏ to view the property or feature that you changed.

- In the Exchange Management Shell, use the **Get-Mailbox** cmdlet to verify the changes. One advantage of using the Exchange Management Shell is that you can view multiple properties for multiple mailboxes. For example, say you used the bulk edit feature in the EAC to enable the archive mailbox and assign a retention policy to all users in your organization. To verify these changes, you could run the following command:

  ```
  Get-Mailbox -ResultSize unlimited -Filter "RecipientTypeDetails -eq 'UserMailbox'" | Format-List
  Name,ArchiveDatabase,RetentionPolicy
  ```

  For more information about the available parameters for the **Get-Mailbox** cmdlet, see Get-Mailbox.

Add or remove email addresses for a mailbox

8/3/2020 • 6 minutes to read • Edit Online

You can use the EAC or the Exchange Management Shell to add or remove an email address for a user mailbox. You can configure more than one email address for the same mailbox. The additional addresses are called *proxy addresses*. A proxy address lets a user receive email that's sent to a different email address. Any email message sent to the user's proxy address is delivered to their primary email address, which is also known as the *primary SMTP address* or the *default reply address*.

> **NOTE**
>
> The procedures in this topic show how to add or remove email addresses for a user mailbox. You can use similar procedures to add or remove email addresses for other recipient types.

For additional management tasks related to managing recipients, see the "Recipients documentation" table in Recipients.

What do you need to know before you begin?

- Estimated time to complete each procedure: 2 minutes.
- To open the EAC, see Exchange admin center in Exchange Server. To open the Exchange Management Shell, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Add an email address to a user mailbox

Use the EAC to add an email address

1. In the EAC, navigate to **Recipients** > **Mailboxes**.
2. In the list of user mailboxes, click the mailbox that you want to add an email address to, and then click **Edit** ✎.
3. On the mailbox properties page, click **Email Address**.

   > **NOTE**
   >
   > On the **Email Address** page, the primary SMTP address is displayed in bold text in the address list, with the uppercase **SMTP** value in the **Type** column.

4. Click **Add** +, and then click **SMTP** to add an SMTP email address to this mailbox.

> **NOTE**
>
> SMTP is the default email address type. You can also add Exchange Unified Messaging (EUM) addresses or custom addresses to a mailbox in Exchange 2016. For more information, see "Change user mailbox properties" in the Manage user mailboxes topic. (**Note**: Unified Messaging is not available in Exchange 2019.)

5. Type the new SMTP address in the **Email address** box, and then click **OK**.

   The new address is displayed in the list of email addresses for the selected mailbox.

6. Click **Save** to save the change.

Use the Exchange Management Shell to add an email address

The email addresses associated with a mailbox are contained in the *EmailAddresses* property for the mailbox. Because it can contain more than one email address, the *EmailAddresses* property is known as a *multivalued* property. The following examples show different ways to modify a multivalued property.

This example shows how to add an SMTP address to the mailbox of Dan Jump.

```
Set-Mailbox "Dan Jump" -EmailAddresses @{add="dan.jump@northamerica.contoso.com"}
```

This example shows how to add multiple SMTP addresses to a mailbox.

```
Set-Mailbox "Dan Jump" -EmailAddresses @{add="dan.jump@northamerica.contoso.com","danj@tailspintoys.com"}
```

For more information about how to use this method of adding and removing values for multivalued properties, see Modifying Multivalued Properties.

This example shows another way to add email addresses to a mailbox by specifying all addresses associated with the mailbox. In this example, danj@tailspintoys.com is the new email address that you want to add. The other two email addresses are existing addresses. The address with the case-sensitive qualifier `SMTP` is the primary SMTP address. You have to include all email addresses for the mailbox when you use this command syntax. If you don't, the addresses specified in the command will overwrite the existing addresses.

```
Set-Mailbox "Dan Jump" -EmailAddresses
"SMTP:dan.jump@contoso.com","dan.jump@northamerica.contoso.com","danj@tailspintoys.com"
```

For detailed syntax and parameter information, see Set-Mailbox.

How do you know this worked?

To verify that you've successfully added an email address to a mailbox, do one of the following:

- In the EAC, navigate to **Recipients** > **Mailboxes**, click the mailbox, and then click **Edit** ✎.

- On the mailbox properties page, click **Email Address**.

- In the list of email addresses for the mailbox, verify that the new email address is included.

Or

- Run the following command in the Exchange Management Shell.

```
Get-Mailbox <identity> | Format-List EmailAddresses
```

- Verify that the new email address is included in the results.

Remove an email address from a user mailbox

Use the EAC to remove an email address

1. In the EAC, navigate to **Recipients** > **Mailboxes**.
2. In the list of user mailboxes, click the mailbox that you want to remove an email address from, and then click **Edit** ✏.
3. On the mailbox properties page, click **Email Address**.
4. In the list of email addresses, select the address you want to remove, and then click **Remove** −.
5. Click **Save** to save the change.

Use the Exchange Management Shell to remove an email address

This example shows how to remove an email address from the mailbox of Janet Schorr.

```
Set-Mailbox "Janet Schorr" -EmailAddresses @{remove="janets@corp.contoso.com"}
```

This example shows how to remove multiple addresses from a mailbox.

```
Set-Mailbox "Janet Schorr" -EmailAddresses @{remove="janet.schorr@corp.contoso.com","janets@tailspintoys.com"}
```

For more information about how to use this method of adding and removing values for multivalued properties, see Modifying Multivalued Properties.

You can also remove an email address by omitting it from the command to set email addresses for a mailbox. For example, let's say Janet Schorr's mailbox has three email addresses: janets@contoso.com (the primary SMTP address), janets@corp.contoso.com, and janets@tailspintoys.com. To remove the address janets@corp.contoso.com, you would run the following command.

```
Set-Mailbox "Janet Schorr" -EmailAddresses "SMTP:janets@contoso.com","janets@tailspintoys.com"
```

Because janets@corp.contoso.com was omitted in the previous command, it's removed from the mailbox.

For detailed syntax and parameter information, see Set-Mailbox.

How do you know this worked?

To verify that you've successfully removed an email address from a mailbox, do one of the following:

- In the EAC, navigate to **Recipients** > **Mailboxes**, click the mailbox, and then click **Edit** ✏.
- On the mailbox properties page, click **Email Address**.
- In the list of email addresses for the mailbox, verify that the email address isn't included.

Or

- Run the following command in the Exchange Management Shell.

```
Get-Mailbox <identity> | Format-List EmailAddresses
```

- Verify that the email address isn't included in the results.

Use the Exchange Management Shell to add email addresses to multiple mailboxes

You can add a new email address to multiple mailboxes at one time by using the Exchange Management Shell and a comma separated values (CSV) file.

This example imports data from C:\Users\Administrator\Desktop\AddEmailAddress.csv, which has the following format.

```
Mailbox,NewEmailAddress
Dan Jump,danj@northamerica.contoso.com
David Pelton,davidp@northamerica.contoso.com
Kim Akers,kima@northamerica.contoso.com
Janet Schorr,janets@northamerica.contoso.com
Jeffrey Zeng,jeffreyz@northamerica.contoso.com
Spencer Low,spencerl@northamerica.contoso.com
Toni Poe,tonip@northamerica.contoso.com
...
```

Run the following command to use the data in the CSV file to add the email address to each mailbox specified in the CSV file.

```
Import-CSV "C:\Users\Administrator\Desktop\AddEmailAddress.csv" | foreach {Set-Mailbox $_.Mailbox -
EmailAddresses @{add=$_.NewEmailAddress}}
```

> **NOTE**
>
> The column names in the first row of this CSV file (`Mailbox,NewEmailAddress`) are arbitrary. Whatever you use for column names, make sure you use the same column names in the Exchange Management Shell command.

How do you know this worked?

To verify that you've successfully added an email address to multiple mailboxes, do one of the following:

- In the EAC, navigate to **Recipients** > **Mailboxes**, click a mailbox that you added the address to, and then click **Edit** ✏.

- On the mailbox properties page, click **Email Address**.

- In the list of email addresses for the mailbox, verify that the new email address is included.

Or

- Run the following command in the Exchange Management Shell, using the same CSV file that you used to add the new email address.

  ```
  Import-CSV "C:\Users\Administrator\Desktop\AddEmailAddress.csv" | foreach {Get-Mailbox $_.Mailbox |
  Format-List Name,EmailAddresses}
  ```

- Verify that the new email address is included in the results for each mailbox.

Configure email forwarding for a mailbox

8/3/2020 • 3 minutes to read • Edit Online

Email forwarding lets you to set up a mailbox to forward email messages sent to a user's mailbox to another user's mailbox in or outside of your organization.

Use the Exchange admin center and the Exchange Management Shell

You can use either the Exchange admin center (EAC) or Exchange Management Shell to set up email forwarding.

You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Recipient Provisioning Permissions" entry in the Recipients Permissions topic.

Use the Exchange admin center to set up email forwarding

1. In the Exchange admin center, navigate to **Recipients** > **Mailboxes**.

2. In the list of user mailboxes, click or tap the mailbox that you want to set up mail forwarding for, and then click or tap **Edit** ✏.

3. On the mailbox properties page, click **Mailbox Features**.

4. Under **Mail Flow**, select **View details** to view or change the setting for forwarding email messages.

   On this page, you can set the maximum number of recipients that the user can send a message to. The recipient limit is unlimited by default. If you want to specify a limit, click the **Maximum recipients** check box and then type the limit in the text box beneath the check box.

5. Check the **Enable forwarding** check box, and then click or tap **Browse**.

6. On the **Select Recipient** page, select a user you want to forward all email to. Select the **Deliver message to both forwarding address and mailbox** check box if you want both the recipient and the forwarding email address to get copies of the emails sent. Click or tap **OK**, and then click or tap **Save**.

> **NOTE**
>
> What if you want to forward emails to an email address outside your organization? You can use the Exchange Management Shell to do this. See the following example in "Use the Exchange Management Shell to configure mail forwarding".

Use the Exchange Management Shell to set up mail forwarding

Haven't used Exchange Management Shell much? Check out the Exchange Management Shell topic to learn more. Take a look at the Get-Mailbox and Set-Mailbox topics for more details on the cmdlets used here.

This example delivers email to the mailbox of Douglas Kohn and also forwards all mail sent to Douglas Kohn to an external email address, douglaskohn.parents@fineartschool.net.

```
Set-Mailbox -Identity "Douglas Kohn" -DeliverToMailboxAndForward $true -ForwardingSMTPAddress
"douglaskohn.parents@fineartschool.net"
```

This example forwards all email sent to the mailbox of Ken Sanchez, an employee of Contoso Suites, to one of his coworkers, pilarp@contoso.com.

```
Set-Mailbox -Identity "Ken Sanchez" -ForwardingAddress "pilarp@contoso.com"
```

For detailed syntax and parameter information, see Set-Mailbox.

How do you know this worked?

To make sure that you've successfully set up email forwarding, do one of the following:

1. In the Exchange admin center, go to **Recipients** > **Mailboxes**.

2. In the list of user mailboxes, click or tap the mailbox that you configured email forwarding for, and then click **Edit** ✎.

3. On the mailbox properties page, click or tap **Mailbox Features**.

4. Under **Mail Flow**, click or tap **View details** to view the mail forwarding settings.

Or

Run the following command in the Exchange Management Shell.

```
Get-Mailbox <identity> | Format-List ForwardingSMTPAddress,DeliverToMailboxandForward
```

Make sure that the forwarding address is listed in the *ForwardingSMTPAddress* parameter. Also, if the *DeliverToMailboxAndForward* parameter is set to `$true`, messages will be delivered to the mailbox and to the forwarding address. If the parameter is set to `$false`, messages are delivered only to the forwarding address.

End users

Check out the following topics on how to forward your email to another email address by using Outlook and Outlook Web App.

- Forward email to another email account

- Manage email messages by using rules

Additional information

For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Configure message delivery restrictions for a mailbox

8/3/2020 • 4 minutes to read • Edit Online

You can use the EAC or the Exchange Management Shell to place restrictions on whether messages are delivered to individual recipients. Message delivery restrictions are useful to control who can send messages to users in your organization. For example, you can configure a mailbox to accept or reject messages sent by specific users or to accept messages only from users in your Exchange organization.

The message delivery restrictions covered in this topic apply to all recipient types. To learn more about the different recipient types, see Recipients.

For additional management tasks related to recipients, see the following topics:

- Manage user mailboxes
- Manage distribution groups
- Manage dynamic distribution groups
- Manage mail users
- Manage mail contacts

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the EAC to place message delivery restrictions

1. In the EAC, navigate to **Recipients** > **Mailboxes**.
2. In the list of user mailboxes, click the mailbox that you want to set up message delivery restrictions for, and then click **Edit** ✎.
3. On the mailbox properties page, click **Mailbox Features**.
4. Under **Message Delivery Restrictions**, click **View details** to view and change the following delivery restrictions:
   - **Accept messages from**: Use this section to specify who can send messages to this user.
   - **All senders**: This option specifies that the user can accept messages from all senders. This includes

both senders in your Exchange organization and external senders. This is the default option. It includes external users only if you clear the **Require that all senders are authenticated** check box. If you select this check box, messages from external users will be rejected.

- **Only senders in the following list**: This option specifies that the user can accept messages only from a specified set of senders in your Exchange organization. Click **Add** + to display a list of all recipients in your Exchange organization. Select the recipients you want, add them to the list, and then click **OK**. You can also search for a specific recipient by typing the recipient's name in the search box and then clicking **Search** 🔍.

- **Require that all senders are authenticated**: This option prevents anonymous users from sending messages to the user. This includes external users that are outside of your Exchange organization.

- **Reject messages from**: Use this section to block people from sending messages to this user.

- **No senders**: This option specifies that the mailbox won't reject messages from any senders in the Exchange organization. This is the default option.

- **Senders in the following list**: This option specifies that the mailbox will reject messages from a specified set of senders in your Exchange organization. Click **Add** + to display a list of all recipients in your Exchange organization. Select the recipients you want, add them to the list, and then click **OK**. You can also search for a specific recipient by typing the recipient's name in the search box and then clicking **Search** 🔍.

5. Click **OK** to close the **Message Delivery Restrictions** page, and then click **Save** to save your changes.

Use the Exchange Management Shell to place message delivery restrictions

The following examples show how to use the Exchange Management Shell to configure message delivery restrictions for a mailbox. For other recipient types, use the corresponding **Set-** cmdlet with the same parameters.

This example configures the mailbox of Robin Wood to accept messages only from the users Lori Penor, Jeff Phillips, and members of the distribution group Legal Team 1.

```
Set-Mailbox -Identity "Robin Wood" -AcceptMessagesOnlyFrom "Lori Penor","Jeff Phillips" -
AcceptMessagesOnlyFromDLMembers "Legal Team 1"
```

NOTE

If you're configuring a mailbox to accept messages only from individual senders, you have to use the *AcceptMessagesOnlyFrom* parameter. If you're setting up a mailbox to accept messages only from senders that are members of a specific distribution group, use the *AcceptMessagesOnlyFromDLMembers* parameter.

This example adds the user named David Pelton to the list of users whose messages will be accepted by the mailbox of Robin Wood.

```
Set-Mailbox -Identity "Robin Wood" -AcceptMessagesOnlyFrom @{add="David Pelton"}
```

This example configures the mailbox of Robin Wood to require all senders to be authenticated. This means the mailbox will only accept messages sent by other users in your Exchange organization.

```
Set-Mailbox -Identity "Robin Wood" -RequireSenderAuthenticationEnabled $true
```

This example configures the mailbox of Robin Wood to reject messages from the users Joe Healy, Terry Adams, and members of the distribution group Legal Team 2.

```
Set-Mailbox -Identity "Robin Wood" -RejectMessagesFrom "Joe Healy","Terry Adams" -RejectMessagesFromDLMembers
"Legal Team 2"
```

This example configures the mailbox of Robin Wood to also reject messages sent by members of the group Legal Team 3.

```
Set-Mailbox -Identity "Robin Wood" -RejectMessagesFromDLMembers @{add="Legal Team 3"}
```

> **NOTE**
>
> If you're setting up a mailbox to reject messages from individual senders, you have to use the *RejectMessagesFrom* parameter. If you're setting up a mailbox to reject messages from senders that are members of a specific distribution group, use the *RejectMessagesFromDLMembers* parameter.

For detailed syntax and parameter information related to placing delivery restrictions for different types of recipients, see the following topics:

- Set-DistributionGroup
- Set-DynamicDistributionGroup
- Set-Mailbox
- Set-MailContact
- Set-MailUser

How do you know this worked?

To verify that you've successfully placed message delivery restrictions for a user mailbox, do one the following:

1. In the EAC, navigate to **Recipients** > **Mailboxes**.
2. In the list of user mailboxes, click the mailbox that you want to verify the message delivery restrictions for, and then click **Edit** ✎.
3. On the mailbox properties page, click **Mailbox Features**.
4. Under **Message Delivery Restrictions**, click **View details** to verify the delivery restrictions for the mailbox.

Or

Run the following command in the Exchange Management Shell.

```
Get-Mailbox <identity> | Format-List
AcceptMessagesOnlyFrom,AcceptMessagesOnlyFromDLMembers,RejectMessagesFrom,RejectMessagesFromDLMembers,RequireS
enderAuthenticationEnabled
```

Configure message size limits for a mailbox

8/3/2020 • 2 minutes to read • Edit Online

Message size limits control the size of messages that a user can send and receive. By default, when a mailbox is created, there isn't a size limit for sent and received messages.

Keep in mind that there are other settings in an Exchange organization that determine the maximum message size a mailbox can send and receive (for example, the maximum message size configured on a Mailbox server). To learn more about the message size restrictions in Exchange, including the types of message size limits, their scope, and the order of precedence, see Message size and recipient limits in Exchange Server.

For additional management tasks related to user mailboxes, see Manage user mailboxes.

> **NOTE**
>
> You can also control the size of messages sent and received by mail users and from shared mailboxes.

What do you need to know before you begin?

- Estimated time to complete: 2 minutes.
- To open the EAC, see Exchange admin center in Exchange Server. To open the Exchange Management Shell, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the EAC to set message size limits

1. In the EAC, navigate to **Recipients** > **Mailboxes**.
2. In the list of user mailboxes, click the mailbox that you want to change the message size limits for, and then click **Edit** ✏.
3. On the mailbox properties page, click **Mailbox Features**.
4. Under **Message Size Restrictions**, click **View details** to view and change the following message size limits:
    - **Sent messages**: To set a maximum size for messages sent by this user, select the **Maximum message size (KB)** check box and type a value in the box. The message size must be between 0 and 2,097,151 KB. If the user sends a message larger than the specified size, the message will be returned to the user with a descriptive error message.

   - **Received messages**: To set a maximum size for messages received by this user, select the **Maximum message size (KB)** check box and type a value in the box. The message size must be between 0 and 2,097,151 KB. If the user receives a message larger than the specified size, the message will be returned to the sender with a descriptive error message.

5. Click **OK**, and then click **Save** to save your changes.

Use the Exchange Management Shell to configure message size limits

This example sets the maximum size for sent messages to 25 MB and the maximum size for received messages to 35 MB for the mailbox of Debra Garcia.

```
Set-Mailbox -Identity "Debra Garcia" -MaxSendSize 25mb -MaxReceiveSize 35mb
```

For detailed syntax and parameter information, see Set-Mailbox.

How do you know this worked?

To verify that you've successfully set up message size limits for a mailbox, do one of the following:

1. In the EAC, navigate to **Recipients** > **Mailboxes**.

2. In the list of user mailboxes, click the mailbox that you want to verify the message size limits for, and then click **Edit** ✎.

3. On the mailbox properties page, click **Mailbox Features**.

4. Under **Message Size Restrictions**, click **View details** to verify the message size limits for the mailbox.

   Or

   Run the following command in the Exchange Management Shell.

   ```
   Get-Mailbox -Identity <Identity> | Format-List MaxSendSize,MaxReceiveSize
   ```

Configure storage quotas for a mailbox

8/3/2020 • 3 minutes to read • Edit Online

You can use the Exchange admin center (EAC) or the Exchange Management Shell to customize the mailbox storage quotas for specific mailboxes. Storage quotas let you control the size of mailboxes and manage the growth of mailbox databases. When a mailbox reaches or exceeds a specified storage quota, Exchange sends a descriptive notification to the mailbox owner.

Storage quotas are typically configured on a per-database basis. This means that the quotas configured for a mailbox database apply to all mailboxes in that database. For more information about managing per-database mailbox settings, see Manage mailbox databases in Exchange Server.

This topic shows you how to customize storage settings for a specific mailbox instead of using the storage settings from the mailbox database. For additional management tasks related to user mailboxes, see Manage user mailboxes.

What do you need to know before you begin?

- Estimated time to complete: 2 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the EAC to set storage quotas for a mailbox

1. In the EAC, navigate to **Recipients** > **Mailboxes**.
2. In the list of user mailboxes, click the mailbox that you want to change the storage quotas for, and then click **Edit** ✎.
3. On the mailbox properties page, click **Mailbox Usage**, and then click **More options**.
4. Click **Customize the settings for this mailbox**, and then set the following boxes. The value range for any of the storage quota settings is from 0 through 2047 gigabytes (GB).

   - **Issue a warning at (GB)**: This box displays the maximum storage limit before a warning is issued to the user. If the mailbox size reaches or exceeds the value specified, Exchange sends a warning message to the user.

> **IMPORTANT**
>
> The message associated with the **Issue warning** quota won't be sent to the user unless the value of this setting is greater than 50% of the value specified in the **Prohibit send** quota. For example, if you set the **Prohibit send** quota to 8 MB, you must set the **Issue warning** quota to at least 4 MB. If you don't, the **Issue warning** quota message won't be sent.

- **Prohibit send at (GB)**: If the mailbox size reaches or exceeds the specified limit, Exchange prevents the user from sending new messages and displays a descriptive error message.

- **Prohibit send and receive at (GB)**: If the mailbox size reaches or exceeds the specified limit, Exchange prevents the mailbox user from sending new messages and won't deliver any new messages to the mailbox. Any messages sent to the mailbox are returned to the sender with a descriptive error message.

5. Click **Save** to save your changes.

Use the Exchange Management Shell to configure storage quotas for a mailbox

This example sets the issue warning, prohibit send, and prohibit send and receive quotas for Joe Healy's mailbox to 24.5 GB, 24.75 GB, and 25 GB respectively.

> **NOTE**
>
> To ensure that the custom settings for the mailbox are used rather than the mailbox database defaults, you must set the *UseDatabaseQuotaDefaults* parameter to `$false`.

```
Set-Mailbox -Identity "Joe Healy" -IssueWarningQuota 24.5gb -ProhibitSendQuota 24.75gb -
ProhibitSendReceiveQuota 25gb -UseDatabaseQuotaDefaults $false
```

This example sets the issue warning, prohibit send, and prohibit send and receive quotas for Ayla Kol's mailbox to 900 megabytes (MB), 950 MB, and 1 GB respectively, and configures the mailbox to use custom settings.

```
Set-Mailbox -Identity "Ayla Kol" -IssueWarningQuota 900mb -ProhibitSendQuota 950mb -ProhibitSendReceiveQuota
1gb -UseDatabaseQuotaDefaults $false
```

For detailed syntax and parameter information, see Set-Mailbox.

How do you know this worked?

To verify that you've successfully set the storage quotas for a mailbox, do one of the following:

1. In the EAC, navigate to **Recipients** > **Mailboxes**.

2. In the list of user mailboxes, click the mailbox that you want to verify the storage quotas for, and then click **Edit** ✎.

3. On the mailbox properties page, click **Mailbox Usage**, and then click **More options**.

4. Verify that **Customize the settings for this mailbox** is selected.

5. Verify the storage quota settings.

Or

In the Exchange Management Shell, replace <Identity> with the name, email address or alias of the mailbox, and run the following command:

```
Get-Mailbox <Identity> | Format-List
IssueWarningQuota,ProhibitSendQuota,ProhibitSendReceiveQuota,UseDatabaseQuotaDefaults
```

Configure Deleted Item retention and Recoverable Items quotas

8/3/2020 • 3 minutes to read • Edit Online

When a user deletes items from the Deleted Items default folder by using the Delete, Shift+Delete, or **Empty Deleted Items Folder** actions, the items are moved to the **Recoverable Items\Deletions** folder. The duration that deleted items remain in this folder is based on the deleted item retention settings configured for the mailbox database or the mailbox. By default, a mailbox database is configured to retain deleted items for 14 days, and the recoverable items warning quota and recoverable items quota are set to 20 gigabytes (GB) and 30 GB respectively.

> **NOTE**
>
> Before the retention time for deleted items elapses,Outlook and Outlook on the web users can recover deleted items by using the Recover Deleted Items feature. To learn more about these features, see the "Recover deleted items" topic for Outlook for Windows or Outlook on the web.

You can use the Exchange Management Shell to configure deleted item retention settings and recoverable items quotas for a mailbox or mailbox database. Deleted item retention settings are ignored when a mailbox is placed on In-Place Hold or litigation hold.

To learn more about deleted item retention, the Recoverable Items folder, In-Place Hold, and litigation hold, see Recoverable Items folder in Exchange Server.

What do you need to know before you begin?

- Estimated time to completion: 5 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Messaging records management" entry in the Messaging policy and compliance permissions in Exchange Server topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Configure deleted item retention for a mailbox

Use the Exchange admin center (EAC) to configure deleted item retention for a mailbox

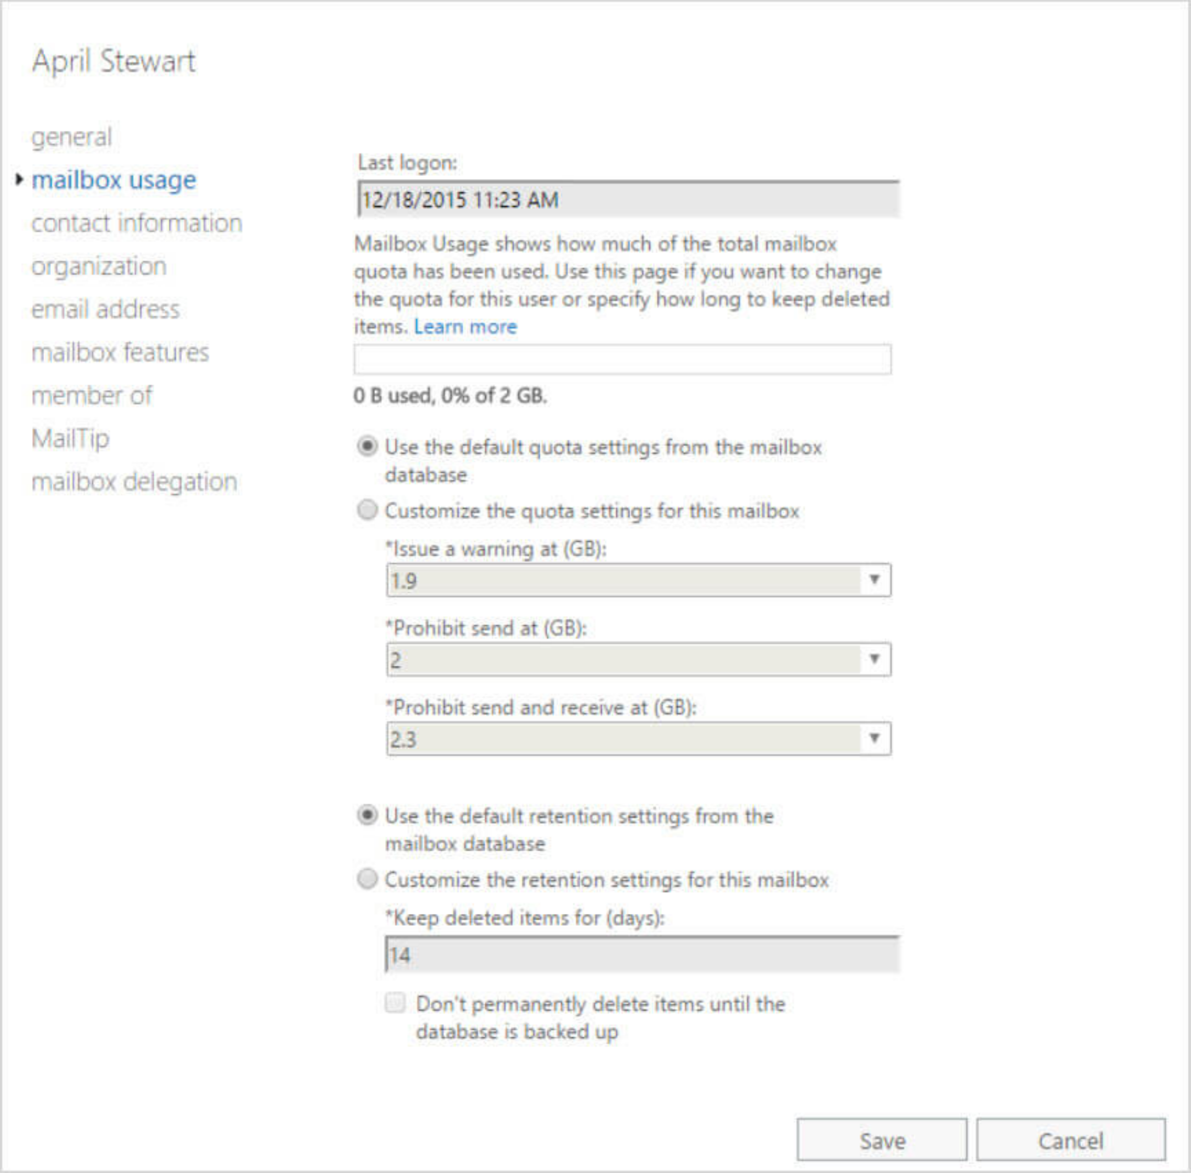
1. Navigate to **Recipients** > **Mailboxes**.
2. In the list view, select a mailbox, and then click **Edit** ✎.
3. On the mailbox property page, click **Mailbox usage**, click **More options**, and then select one of the following:
   - **Use the default retention settings from the mailbox database**: Use the deleted item retention

setting that's configured for the mailbox database.

- **Customize the settings for this mailbox**: Configure deleted item retention settings for the mailbox.

- ***Keep deleted items for (days)**: Displays the length of time that deleted items are retained before they're permanently deleted and can't be recovered by the user. When the mailbox is created, this value is based on the deleted item retention settings configured for the mailbox database. By default, a mailbox database is configured to retain deleted items for 14 days. The value range for this property is from 0 through 24,855 days.

- **Don't permanently delete items until the database is backed up**: Check this box to prevent mailboxes and email messages from being deleted until after the mailbox database on which the mailbox is located has been backed up.



April Stewart

Last logon:
12/18/2015 11:23 AM

Mailbox Usage shows how much of the total mailbox quota has been used. Use this page if you want to change the quota for this user or specify how long to keep deleted items. Learn more

0 B used, 0% of 2 GB.

● Use the default quota settings from the mailbox database

○ Customize the quota settings for this mailbox

*Issue a warning at (GB):
1.9

*Prohibit send at (GB):
2

*Prohibit send and receive at (GB):
2.3

● Use the default retention settings from the mailbox database

○ Customize the retention settings for this mailbox

*Keep deleted items for (days):
14

□ Don't permanently delete items until the database is backed up

Use the Exchange Management Shell to configure deleted item retention for a mailbox

This example configures April Stewart's mailbox to retain deleted items for 30 days.

```
Set-Mailbox -Identity - "April Stewart" -RetainDeletedItemsFor 30
```

For detailed syntax and parameter information, see Set-Mailbox.

Use the Exchange Management Shell to configure recoverable items quotas for a mailbox

> **NOTE**
>
> You can't use the EAC to configure recoverable items quotas for a mailbox.

This example configures a recoverable items warning quota of 12 GB and a recoverable items quota of 15 GB for April Stewart's mailbox.

```
Set-Mailbox -Identity "April Stewart" -RecoverableItemsWarningQuota 12GB -RecoverableItemsQuota 15GB -
UseDatabaseQuotaDefaults $false
```

> **NOTE**
>
> To configure a mailbox to use different recoverable items quotas than the mailbox database in which it resides, you must set the *UseDatabaseQuotaDefaults* parameter to `$false`.

For detailed syntax and parameter information, see Set-Mailbox.

Use the Exchange Management Shell to configure deleted item retention for a mailbox database

> **NOTE**
>
> You can't use the EAC to configure deleted item retention for a mailbox database.

This example configures a deleted item retention period of 10 days for the mailbox database MDB2.

```
Set-MailboxDatabase -Identity MDB2 -DeletedItemRetention 10
```

For detailed syntax and parameter information, see Set-MailboxDatabase.

Use the Exchange Management Shell to configure recoverable items quotas for a mailbox database

> **NOTE**
>
> You can't use the EAC to configure recoverable items quotas for a mailbox database

This example configures a recoverable items warning quota of 15 GB and a recoverable items quota of 20 GB on mailbox database MDB2.

```
Set-MailboxDatabase -Identity MDB2 -RecoverableItemsWarningQuota 15GB -RecoverableItemsQuota 20GB
```

For detailed syntax and parameter information, see Set-MailboxDatabase.

Convert a mailbox in Exchange Server

8/3/2020 • 3 minutes to read • Edit Online

In Exchange Server 2013 or later, converting a mailbox from one type of mailbox to another is mostly unchanged from the experience in Exchange 2010. You still need to use the **Set-Mailbox** cmdlet in the Exchange Management Shell to do the conversion.

You can convert the following mailboxes to a different type:

- User mailbox to room or equipment mailbox
- User mailbox to shared mailbox
- Shared mailbox to user mailbox
- Shared mailbox to room or equipment mailbox
- Room or equipment mailbox to user mailbox
- Room or equipment mailbox to shared mailbox

> **NOTE**
> If your organization uses a hybrid Exchange environment, you need to manage your mailboxes by using the on-premises Exchange management tools. To convert a mailbox in a hybrid environment, you might need to move the mailbox back to on-premises Exchange, convert the mailbox type, and then move it back to Microsoft 365 or Office 365.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- Room, equipment, and shared mailboxes have associated user accounts in Active Directory, but the accounts are disabled. When you convert one of these mailbox types to a regular (user) mailbox, you need to specify a password that satisfies the length and complexity requirements for your organization.

  Overwriting an existing password requires the Reset Password role, which isn't assigned to any role groups by default. To assign the role to a role group that you belong to, see Add a role to a role group. Note that changes in permission require you to log off and log on for the changes to take effect.
- When you convert a regular (user) mailbox to a room, equipment, or shared mailbox, the associated account is disabled.

  For room mailboxes, you can enable the associated user account, which also requires you to specify a password (which requires the Reset Password role). You need to enable the room mailbox user account for features like the Skype for Business Room System.
- To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard

shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the Exchange Management Shell to convert a mailbox

To convert a mailbox to a different type, use this syntax:

```
Set-Mailbox -Identity <MailboxIdentity> -Type <Regular | Room | Equipment | Shared> [-Password (ConvertTo-SecureString -String '<Password>' -AsPlainText -Force)] [-EnableRoomMailboxAccount <$true | $false>] [-RoomMailboxPassword (ConvertTo-SecureString -String '<Password>' -AsPlainText -Force)] [-ResetPasswordOnNextLogon <$true | $false>]
```

This example converts the shared mailbox named Marketing Dept 01 to a user mailbox with the new password P@ssw0rd25, and the requirement to change the password the next time the user logs in to the mailbox.

```
Set-Mailbox -Identity "Marketing Dept 01" -Type Regular -Password (ConvertTo-SecureString -String 'P@ssw0rd25' -AsPlainText -Force) -ResetPasswordOnNextLogon $true
```

This example converts the user mailbox named Conference Room 01 to a room mailbox.

```
Set-Mailbox -Identity "Conference Room 01" -Type Room
```

This is the same example, but the user account for the room mailbox is enabled, and the password is P@ssw0rd25

```
Set-Mailbox -Identity "Conference Room 01" -Type Room -EnableRoomMailboxAccount $true -RoomMailboxPassword (ConvertTo-SecureString -String 'P@ssw0rd25' -AsPlainText -Force)
```

Note: Even when you convert a user mailbox with a known password to a room mailbox, you still need to use the *RoomMailboxPassword* parameter to specify a password.

For detailed syntax and parameter information, see Set-Mailbox.

How do you know this worked?

To verify that you've successfully converted a mailbox, replace *<MailboxIdentity>* with the name, alias, or email address of the mailbox, and run this command in the Exchange Management Shell to verify the property values:

```
Get-Mailbox -Identity <MailboxIdentity> | Format-List Name,RecipientTypeDetails,UserPrincipalName,AccountDisabled
```

For detailed syntax and parameter information, see Get-Mailbox.

Enable or disable single item recovery for a mailbox

8/3/2020 • 2 minutes to read • Edit Online

You can use the Exchange Management Shell to enable or disable single item recovery on a mailbox. In Exchange Server, single item recovery is disabled when a mailbox is created. If single item recovery is enabled, messages that are purged (hard-deleted) by the user are retained in the Recoverable Items folder of the mailbox until the deleted item retention period expires. This lets an administrator recover messages purged by the user before the deleted item retention period expires. Also, if a message is changed by a user or a process, copies of the original item are also retained when single item recovery is enabled.

What do you need to know before you begin?

- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Retention and legal holds" entry in the Recipients Permissions topic.
- You can't use the Exchange admin center (EAC) to enable or disable single item recovery.
- In Exchange Server, the mailbox uses the deleted item retention settings of the mailbox database, by default. The deleted item retention period for a mailbox database is set to 14 days, but you can override the default by configuring this setting on a per-mailbox basis. For details, see Configure Deleted Item retention and Recoverable Items quotas.

Enable single item recovery

This example enables single item recovery for the mailbox of April Summers.

```
Set-Mailbox -Identity "April Summers" -SingleItemRecoveryEnabled $true
```

This example enables single item recovery for the mailbox of Pilar Pinilla and sets the number of days that deleted items are retained to 30 days.

```
Set-Mailbox -Identity "Pilar Pinilla" -SingleItemRecoveryEnabled $true -RetainDeletedItemsFor 30
```

This example enables single item recovery for all user mailboxes in the organization.

```
Get-Mailbox -ResultSize unlimited -Filter "RecipientTypeDetails -eq 'UserMailbox'" | Set-Mailbox -
SingleItemRecoveryEnabled $true
```

This example enables single item recovery for all user mailboxes in the organization and sets the number of days that deleted items are retained to 30 days

```
Get-Mailbox -ResultSize unlimited -Filter "RecipientTypeDetails -eq 'UserMailbox'" | Set-Mailbox -
SingleItemRecoveryEnabled $true -RetainDeletedItemsFor 30
```

For detailed syntax and parameter information, see Set-Mailbox.

Disable single item recovery

You might need to disable single item recovery for a user's mailbox. For example, before you can use `Search-`

Mailbox -DeleteContent to permanently delete content from a mailbox, you have to disable single item recovery. For more information, see Search for and delete messages in Exchange Server.

This example disables single item recovery for the mailbox of Ayla Kol.

```
Set-Mailbox -Identity "Ayla Kol" -SingleItemRecoveryEnabled $false
```

How do you know this worked?

To verify that you've enabled single item recovery for a mailbox and display the value for how long deleted items will be retained (in days), run the following command.

```
Get-Mailbox <Name> | Format-List SingleItemRecoveryEnabled,RetainDeletedItemsFor
```

You can use this same command to verify that single item recovery is disabled for a mailbox.

More information

- To learn more about single item recovery, see Recoverable Items folder in Exchange Server. To recover messages purged by the user before the deleted item retention period expires, see Recover deleted messages in a user's mailbox .

- If a mailbox is placed on In-Place Hold or Litigation Hold, messages in the Recoverable Items folder are retained until the hold duration expires. If the hold duration is unlimited, then items are retained until the hold is removed or the hold duration is changed.

Recover deleted messages in a user's mailbox

8/3/2020 • 6 minutes to read • Edit Online

Administrators can search for items that are purged (hard-deleted) by a user by using the Recover Deleted Items feature in Outlook or Outlook on the web. They can also search for items deleted by an automated process, such as the retention policy assigned to user mailboxes. In these situations, the purged items can't be recovered by a user. But administrators can recover purged messages if the deleted item retention period for the item hasn't expired.

> **NOTE**
>
> In addition to using this procedure to search for and recover deleted items, you can also use this procedure to search for items residing in other folders in the mailbox and to delete items from the source mailbox (also known as *search and purge*).

What you need to know before you begin?

- Procedures in this topic require specific permissions. See each procedure for its permissions information.
- Single item recovery should be enabled for a mailbox before the item you want to recover is deleted. In Exchange Server, single item recovery is disabled when a mailbox is created. For more information, see Enable or disable single item recovery for a mailbox.
- To search for and recover items, you need the following information:
  - **Source mailbox**: The mailbox being searched.
  - **Target mailbox**: The discovery mailbox in which messages will be recovered. Exchange Server Setup creates a default discovery mailbox. In Exchange Online, a discovery mailbox is also created by default. If required, you can create additional discovery mailboxes. For details, see Create a Discovery Mailbox.

    > **NOTE**
    >
    > When using the **Search-Mailbox** cmdlet, you can also specify a target mailbox that isn't a discovery mailbox. However, you can't specify the same mailbox as the source and target mailbox.

  - **Search criteria**: Criteria include sender or recipient, or keywords (words or phrases) in the message.

Step 1: Search for and recover missing items

You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "In-Place eDiscovery" entry in the Messaging policy and compliance permissions in Exchange Server topic.

NOTE

You can use In-Place eDiscovery in the Exchange admin center (EAC) to search for missing items. However, when using the EAC, you can't restrict the search to the Recoverable Items folder. All messages matching your search parameters will be returned even if they're not deleted. After they're recovered to the specified discovery mailbox, you may need to review the search results and remove unnecessary messages before recovering the remaining messages to the user's mailbox or exporting them to a .pst file. For details about how to use the EAC to perform an In-Place eDiscovery search, see Create an In-Place eDiscovery search in Exchange Server.

The first step in the recovery process is to search for messages in the source mailbox. Use one of the following methods to search a user mailbox and copy messages to a discovery mailbox.

Use the Exchange Management Shell to search for messages

This example searches for messages in April Stewart's mailbox that meet the following criteria:

- Sender: Ken Kwok
- Keyword: Seattle

```
Search-Mailbox "April Stewart" -SearchQuery "from:'Ken Kwok' AND seattle" -TargetMailbox "Discovery Search
Mailbox" -TargetFolder "April Stewart Recovery" -LogLevel Full
```

NOTE

When using the **Search-Mailbox** cmdlet, you can scope the search by using the *SearchQuery* parameter to specify a query formatted using Keyword Query Language (KQL). You can also use the *SearchDumpsterOnly* switch to search only items in the Recoverable Items folder.

For detailed syntax and parameter information, see Search-Mailbox.

How do you know this worked?

To verify that you have successfully searched the messages you want to recover, log on to the discovery mailbox you selected as the target mailbox and review the search results.

Step 2: Restore recovered items

You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "In-Place eDiscovery" entry in the Messaging policy and compliance permissions in Exchange Server topic.

NOTE

You can't use the EAC to restore recovered items.

After messages have been recovered to a discovery mailbox, you can restore them to the user's mailbox by using the **Search-Mailbox** cmdlet. In Exchange Server, you can also use the **New-MailboxExportRequest** and **New-MailboxImportRequest** cmdlets to export the messages to or import the messages from a .pst file.

Use the Exchange Management Shell to restore messages

This example restores messages to April Stewart's mailbox and deletes them from the Discovery Search Mailbox.

```
Search-Mailbox "Discovery Search Mailbox" -SearchQuery "from:'Ken Kwok' AND seattle" -TargetMailbox "April
Stewart" -TargetFolder "Recovered Messages" -LogLevel Full -DeleteContent
```

For detailed syntax and parameter information, see Search-Mailbox.

How do you know this worked?

To verify that you have successfully recovered messages to the user's mailbox, have the user review messages in the target folder you specified in the above command.

Use the Exchange Management Shell to export and import messages from a .pst file

In Exchange Server, you can export contents from a mailbox to a .pst file and import the contents of a .pst file to a mailbox. To learn more about mailbox import and export, see Mailbox imports and exports in Exchange Server. You can't perform this task in Exchange Online.

This example uses the following settings to export messages from the folder April Stewart Recovery in the Discovery Search Mailbox to a .pst file:

- **Mailbox**: Discovery Search Mailbox
- **Source folder**: April Stewart Recovery
- **ContentFilter**: April travel plans
- **PST file path**: \MYSERVER\HelpDeskPst\AprilStewartRecovery.pst

```
New-MailboxExportRequest -Mailbox "Discovery Search Mailbox" -SourceRootFolder "April Stewart Recovery" -
ContentFilter "Subject -eq 'April travel plans'" -FilePath \\MYSERVER\HelpDeskPst\AprilStewartRecovery.pst
```

For detailed syntax and parameter information, see New-MailboxExportRequest.

This example uses the following settings to import messages from a .pst file to the folder Recovered By Helpdesk in April Stewart's mailbox:

- **Mailbox**: April Stewart
- **Target folder**: Recovered By Helpdesk
- **PST file path**: \MYSERVER\HelpDeskPst\AprilStewartRecovery.pst

```
New-MailboxImportRequest -Mailbox "April Stewart" -TargetRootFolder "Recovered By Helpdesk" -FilePath
\\MYSERVER\HelpDeskPst\AprilStewartRecovery.pst
```

For detailed syntax and parameter information, see New-MailboxImportRequest.

How do you know this worked?

To verify that you have successfully exported messages to a .pst file, use Outlook to open the .pst file and inspect its contents. To verify that you have successfully imported messages from the .pst file, have the user inspect the contents of the target folder you specified in the above command.

More information

- The ability to recover deleted items is enabled by *single item recovery*, which lets an administrator recover a message that's been purged by a user or by retention policy as long as the deleted item retention period hasn't expired for that item. To learn more about single item recovery, see Recoverable Items folder in Exchange Server.

- In Exchange Server, a mailbox database is configured to retain deleted items for 14 days, by default. You can configure deleted item retention settings for a mailbox or mailbox database. For more information, see:
  - Configure Deleted Item retention and Recoverable Items quotas
- Users can recover a deleted item if it hasn't been purged and if the deleted item retention period for that item hasn't expired. If users need to recover deleted items from the Recoverable Items folder, point them to the following topics:
  - Recover deleted items in Outlook for Windows
  - Recover deleted items or email in Outlook on the web
- This topic shows you how to use the **Search-Mailbox** cmdlet to search for and recover missing items. If you use this cmdlet, you can search only one mailbox at a time. If you want to search multiple mailboxes at the same time, you can use In-Place eDiscovery in Exchange Server in the Exchange admin center (EAC) or the New-ComplianceSearch cmdlet in Windows PowerShell.
- In addition to using this procedure to search for and recover deleted items, you can also use a similar procedure to search for items in user mailboxes and then delete those items from the source mailbox. For more information, see Search for and delete messages in Exchange Server.

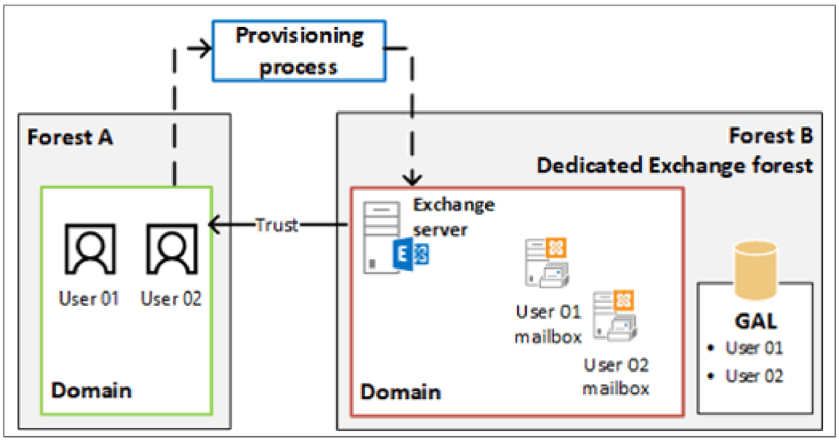
Manage linked mailboxes

8/3/2020 • 25 minutes to read • Edit Online

Linked mailboxes may be necessary for organizations that deploy Exchange in a *resource forest*. The resource forest scenario lets an organization centralize Exchange in a single forest, while allowing access to the Exchange organization with user accounts that are located in one or more trusted forests (called *account forests*). The user account that accesses the linked mailbox doesn't exist in the forest where Exchange is deployed. Therefore, a disabled user account that exists in the same forest as Exchange is created and associated with the corresponding linked mailbox.

The following figure illustrates the relationship between the linked user account used to access the linked mailbox (located in the account forest) and the disabled user account in the Exchange resource forest that's associated with the linked mailbox.

Linked mailboxes



> **NOTE**
>
> A trust between the Exchange forest and at least one account forest must be set up before you can create linked mailboxes. At a minimum, you must set up a one-way, outgoing trust so that the Exchange forest trusts the account forest. For more information, see Learn more about setting up a forest trust to support linked mailboxes.

What do you need to know before you begin?

- Estimated time to complete: 2 to 5 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.
- A user account (called the *linked master account*) must exist in the account forest before you can create a linked mailbox. This is because the linked mailbox is associated with a user in the account forest.
- If you've configured a one-way outgoing trust where the Exchange forest trusts the account forest, you'll need administrator credentials in the account forest to create a linked mailbox.

  To create a linked mailbox without being prompted for administrator credentials in the account forest, you have to create a two-way trust, or create another one-way outgoing trust where the account forest also trusts the Exchange forest. This step also requires administrator credentials in the account forest.

- You can complete this procedure in the Exchange admin center (EAC) or use the Exchange Management Shell.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Create a linked mailbox

Use the EAC to create a linked mailbox

1. In the EAC, navigate to **Recipients** > **Mailboxes**.

2. Click **New** > **Linked mailbox**.

3. On the **New linked mailbox** page, in the **Trusted forest or domain** box, select the name of the account forest that contains the user account that you're creating the linked mailbox for. Click **Next**.

4. If your organization has configured a one-way outgoing trust where the Exchange forest trusts the account forest, you're prompted for administrator credentials in the account forest so that you can gain access to a domain controller in the trusted forest. Type the username and password for an administrator account in the account forest, and then click **Next**.

   > **NOTE**
   >
   > You won't be prompted for administrator credentials if you've created a two-way trust or have created another one-way outgoing trust where the account forest trusts the Exchange forest.

5. Complete the following boxes on the **Select linked master account** page.

   - **Linked domain controller**: Select a domain controller in the account forest. Exchange will connect to this domain controller to retrieve the list of user accounts in the account forest so that you can select the linked master account.

   - **Linked master account**: Click **Browse**, select a user account in the account forest, and then click **OK**. The new linked mailbox will be associated with this account.

6. Click **Next** and complete the following boxes on the **Enter general information** page.

   - *** Name**: Use this box to type a name for the user. This is the name used as the display name in the EAC and your organization's address book, and the name that's listed in Active Directory. This name is required.

   - **Organizational unit**: You can select an organizational unit (OU) other than the default (which is the recipient scope). If the recipient scope is set to the forest, the default value is set to the Users container in the Active Directory domain that contains the computer on which the EAC is running. If the recipient scope is set to a specific domain, the Users container in that domain is selected by default. If the recipient scope is set to a specific OU, that OU is selected by default.

     To select a different OU, click **Browse**. The dialog box displays all OUs in the Exchange forest that are within the specified scope. Select the OU you want, and then click **OK**.

   - *** User logon name**: Use this box to type the user logon name, which is required to create a linked mailbox. Type the username here. This name will be used in the left portion of the email address for the linked mailbox if you don't specify an alias.

> **NOTE**
>
> Because the user account that is created in the Exchange forest is disabled when you create a linked mailbox, the user doesn't use the user logon name to sign in to the linked mailbox. They sign in using their credentials from the account forest.

7. Click **More options** to configure the following boxes. Otherwise, skip to Step 8 to save the new linked mailbox.

   - **Alias**: Type the alias, which specifies the email alias for the linked mailbox. The user's alias is the portion of the email address on the left side of the at (@) symbol. It must be unique in the forest.

     > **NOTE**
     >
     > If you leave this box blank, the value from the username portion of the **User Logon Name** is used for the email alias.

   - **First name**, **Initials**, **Last name**

   - **Mailbox database**: Use this option to specify a mailbox database instead of allowing Exchange to choose a database for you. Click **Browse** to open the **Select Mailbox Database** dialog box. This dialog box lists all the mailbox databases in your Exchange organization. By default, the mailbox databases are sorted by name. You can also click the title of the corresponding column to sort the databases by server name or version. Select the mailbox database you want to use, and then click **OK**.

   - **Address book policy**: Use this option to specify an address book policy (ABP) for the linked mailbox. An ABP contains a global address list (GAL), an offline address book (OAB), a room list, and a set of address lists. When assigned to users, an ABP provides them with access to a customized GAL in Outlook and Outlook on the web (formerly known as Outlook Web App). To learn more, see Address book policies in Exchange Server.

     In the drop-down list, select the policy that you want associated with this mailbox.

8. When you're finished, click **Save** to create the new linked mailbox.

Use the Exchange Management Shell to create a linked mailbox

This example creates a linked mailbox for Ayla Kol in the CONTOSO Exchange resource forest. The FABRIKAM domain is in the account forest. The administrator account FABRIKAM \administrator is used to access the linked domain controller.

```
New-Mailbox -Name "Ayla Kol" -LinkedDomainController "DC1_FABRIKAM" -LinkedMasterAccount " FABRIKAM\aylak" -
OrganizationalUnit Users -UserPrincipalName aylak@contoso.com -LinkedCredential:(Get-Credential
FABRIKAM\administrator)
```

For syntax and parameter information, see New-Mailbox.

How do you know this worked?

To verify that you've successfully created a linked mailbox, do one of the following:

- In the EAC, navigate to **Recipients** > **Mailboxes**. The new linked mailbox is displayed in the mailbox list. Under **Mailbox Type**, the type is **Linked**.

- In the Exchange Management Shell, run the following command to display information about the new linked mailbox.

```
Get-Mailbox <Name> | Format-List Name,RecipientTypeDetails,IsLinked,LinkedMasterAccount
```

Change linked mailbox properties

After you create a linked mailbox, you can make changes and set additional properties by using the EAC or the Exchange Management Shell.

You can also change properties for multiple linked mailboxes at the same time. For more information, see Bulk edit user mailboxes.

> **IMPORTANT**
>
> The estimated time to complete this task will vary based on the number of properties you want to view or change.

Use the EAC to change linked mailbox properties

1. In the EAC, navigate to **Recipients** > **Mailboxes**.

2. In the list of mailboxes, click the linked mailbox that you want to change the properties for, and then click **Edit** ✎.

3. On the mailbox properties page, click one of the following sections to view or change properties.

   - General
   - Mailbox Usage
   - Email Address
   - Mailbox Features
   - Member Of
   - MailTip

General

Use the **General** section to view or change basic information about the user.

- *** Linked mailbox name**: This is the name that's listed in Active Directory. If you change this name, it can't exceed 64 characters.

- *** Display name**: This name appears in your organization's address book, on the To: and From: lines in email, and in the Mailboxes list in the EAC. This name can't contain empty spaces before or after the display name.

- *** User logon name**: For user mailboxes, this is the name that the user uses to sign in to their mailbox and to log on to the domain. For linked mailboxes, the corresponding user account that is created in the Exchange forest when the linked mailbox was created is disabled. The user uses their credentials from the account forest to sign in to the linked mailbox.

  If you change this name, it must be unique in your organization.

- **Linked master account**: This read-only box displays the user (in the format domain\username format) from the account forest that is associated with the linked mailbox. To change the linked master account associated with the linked mailbox, you have to use the **Set-Mailbox** cmdlet in the Exchange Management Shell. If you change the linked master account, the user will have to use the credentials for the new linked master account to sign in to the linked mailbox. For the command syntax to change the linked master account, see Use the Exchange management Shell to change linked mailbox properties.

- **Hide from address lists**: Select this check box to prevent the linked mailbox from appearing in the address book and other address lists that are defined in your Exchange organization. After you select this check box, users can still send messages to this user by using the email address.

Click **More options** to view or change these additional properties:

- **Organizational unit**: This read-only box displays the organizational unit (OU) that contains the user account. You have to use Active Directory Users and Computers to move the user account to a different OU.
- **Mailbox database**: This read-only box displays the name of the mailbox database that hosts the mailbox. To move the mailbox to a different database, select it in the mailbox list, and then click **Move mailbox to a different database** in the Details pane.
- *** Alias** This specifies the email alias for the linked mailbox. The alias is the portion of the email address on the left side of the at (@) symbol. It must be unique in the forest.
- **First name**, **Initials**, **Last name**
- **Custom attributes**: This section displays the custom attributes defined for the linked mailbox. To specify custom attribute values, click **Edit** ✎. You can specify up to 15 custom attributes for the recipient.

Mailbox Usage

Use the **Mailbox Usage** section to view or change the mailbox storage quota and deleted item retention settings for the linked mailbox. These settings are configured by default when the linked mailbox is created. They use the values that are configured for the mailbox database and apply to all mailboxes in that database. You can customize these settings for each mailbox instead of using the mailbox database defaults.

- **Last logon**: This read-only box displays the last time that the user signed in to the mailbox.
- **Mailbox usage**: This area shows the total size of the mailbox and the percentage of the total mailbox quota that has been used.

> **NOTE**
>
> To obtain the information that's displayed in the previous two boxes, the EAC queries the mailbox database that hosts the mailbox. If the EAC can't communicate with the Exchange store that contains the mailbox database, these boxes will be blank. A warning message is displayed if the user hasn't signed in to the mailbox for the first time.

Click **More options** to view or change the mailbox storage quota and the deleted item retention settings for the mailbox.

- **Storage quota settings**: To customize these settings for the mailbox and not use the mailbox database defaults, click **Customize settings for this mailbox**, type a new value, and then click **Save**.

  The value range for any of the storage quota settings is from 0 through 2047 gigabytes (GB).

  - **Issue a warning at (GB)**: This box displays the maximum storage limit before a warning is issued to the user. If the mailbox size reaches or exceeds the value specified, Exchange sends a warning message to the user.
  - **Prohibit send at (GB)**: This box displays the *prohibit send* limit for the mailbox. If the mailbox size reaches or exceeds the specified limit, Exchange prevents the user from sending new messages and displays a descriptive error message.
  - **Prohibit send and receive at (GB)**: This box displays the *prohibit send and receive* limit for the mailbox. If the mailbox size reaches or exceeds the specified limit, Exchange prevents the mailbox user

from sending new messages and won't deliver any new messages to the mailbox. Any messages sent to the mailbox are returned to the sender with a descriptive error message.

- **Deleted item retention settings**: To customize these settings for the mailbox and not use the mailbox database defaults, click **Customize settings for this mailbox**, type a new value, and then click **Save**.
  - **Keep deleted items for (days)**: This box displays the length of time that deleted items are retained before they're permanently deleted and can't be recovered by the user. When the mailbox is created, this length of time is based on the deleted item retention settings configured for the mailbox database. By default, a mailbox database is configured to retain deleted items for 14 days. The value range for this property is from 0 through 24855 days.
  - **Don't permanently delete items until the database is backed up**: Select this check box to prevent mailboxes and email messages from being deleted until after the mailbox database on which the mailbox is located has been backed up.

Email Address

Use the **Email address** section to view or change the email addresses associated with the linked mailbox. This includes the user's primary SMTP addresses and any associated proxy addresses. The primary SMTP address (also known as the *default reply address*) is displayed in bold text in the address list, with the uppercase **SMTP** value in the **Type** column.

- **Add**: Click **Add** + to add a new email address for this mailbox. Select one of following address types:
  - **SMTP**: This is the default address type. Click this radio button and then type the new SMTP address in the *** Email address** box.
  - **EUM**: An EUM (Exchange Unified Messaging) address is used by the Exchange Unified Messaging service in Exchange 2016 to locate UM-enabled users within an Exchange organization. EUM addresses consist of the extension number and the UM dial plan for the UM-enabled user. Click this radio button and type the extension number in the **Address/Extension** box. Then click **Browse** and select a dial plan for the user. (**Note**: Unified Messaging is not available in Exchange 2019.)
  - **Custom address type**: Click this button and type one of the supported non-SMTP email address types in the *** Email address** box.

    > **NOTE**
    >
    > With the exception of X.400 addresses, Exchange doesn't validate custom addresses for proper formatting. You must make sure that the custom address you specify complies with the format requirements for that address type.

- **Automatically update email addresses based on the email address policy applied to this recipient**: Select this check box if you want the recipient's email addresses to be updated automatically when changes are made to email address policies in your organization. This box is selected by default.

Mailbox Features

Use the **Mailbox Features** section to view or change the following mailbox features and settings:

- **Sharing policy**: This box shows the sharing policy applied to the mailbox. A sharing policy controls how users in your organization can share calendar and contact information with users outside your Exchange organization. The Default Sharing Policy is assigned to mailboxes when they are created. To change the sharing policy that's assigned to the user, select a different one from the drop-down list.
- **Role assignment policy**: This box shows the role assignment policy assigned to the mailbox. The role assignment policy specifies the role-based access control (RBAC) roles that are assigned to the user and controls which mailbox and distribution group configuration settings users can modify. To change the role

assignment policy that's assigned to the user, select a different one from the drop-down list.

- **Retention policy**: This box shows the retention policy assigned to the mailbox. A retention policy is a group of retention tags that are applied to the user's mailbox. The tags allow you to control how long to keep items in users' mailboxes and define which action to take on items that have reached a certain age. A retention policy isn't assigned to mailboxes when they are created. To assign a retention policy to the user, select one from the drop-down list.

- **Address Book policy**: This box shows the address book policy applied to the mailbox. An address book policy allows you to segment users into specific groups to provide customized views of the address book. To apply or change the address book policy that's applied to the mailbox, select one from the drop-down list.

- **Unified Messaging**: This feature is disabled by default. When you enable Unified Messaging (UM) in Exchange 2016, the user will be able to use your organization's UM features and a default set of UM properties are applied to the user. Click **Enable** to enable UM for the mailbox. For information about how to enable UM, see Enable a User for Unified Messaging. (**Note**: Unified Messaging is not available in Exchange 2019.)

  > **NOTE**
  >
  > A UM dial plan and a UM mailbox policy must exist before you can enable UM.

- **Mobile Devices**: Use this section to view and change the settings for Exchange ActiveSync, which is enabled by default. Exchange ActiveSync enables access to an Exchange mailbox from a mobile device. Click **Disable Exchange ActiveSync** to disable this feature for the mailbox.

- **Outlook Web App**: This feature is enabled by default. Outlook on the web provides access to an Exchange mailbox via a web browser. Click **Disable** to disable Outlook on the web for the mailbox. Click **Edit details** to add or change an Outlook on the web mailbox policy for the mailbox.

- **IMAP**: This feature is enabled by default. Click **Disable** to disable IMAP for the mailbox.

- **POP3**: This feature is enabled by default. Click **Disable** to disable POP3 for the mailbox.

- **MAPI**: This feature is enabled by default. MAPI enables access to an Exchange mailbox from a MAPI client such as Outlook. Click **Disable** to disable MAPI for the mailbox.

- **Litigation hold**: This feature is disabled by default. Litigation hold preserves deleted mailbox items and records changes made to mailbox items. Deleted items and all instances of changed items are returned in a discovery search. Click **Enable** to put the mailbox on litigation hold. If the mailbox is on litigation hold, click **Disable** to remove the litigation hold. If the mailbox is on litigation hold, click **Edit details** to view and change the following litigation hold settings:

  - **Hold date**: This read-only box indicates date and time when the mailbox was put on litigation hold.

  - **Put on hold by**: This read-only box indicates the user who put the mailbox on litigation hold.

  - **Note**: Use this box to notify the user about the litigation hold, explain why the mailbox is on litigation hold, or provide additional guidance to the user, such as informing them that the litigation hold won't affect their day-to-day use of email.

  - **URL**: Use this box to provide a URL to a website that provides information or guidance about the litigation hold on the mailbox.

> **NOTE**
>
> The text from these boxes appears in the user's mailbox only if they're using Outlook 2010 or later versions. It doesn't appear in Outlook on the web or other email clients. To view the text from the Note and URL boxes in Outlook, click the **File** tab and, on the **Info** page, under **Account Settings**, you'll see the litigation hold comment.

- **Archiving**: If an archive mailbox doesn't exist for the user, this feature is disabled. To enable an archive mailbox, click **Enable**. If the user has an archive mailbox, the size of the archive mailbox and usage statistics are displayed. Click **Edit details** to view and change the following archive mailbox settings:
  - **Status**: This read-only box indicates whether an archive mailbox exists.
  - **Database**: This read-only box shows the name of the mailbox database that hosts the archive mailbox.
  - **Name**: Type the name of the archive mailbox in this box. This name is displayed under the folder list in Outlook or Outlook on the web.
  - **Quota usage**: This read-only area shows the total size of the archive mailbox and the percentage of the total archive mailbox quota that has been used.
  - **Quota value (GB)**: This box shows the total size of the archive mailbox. To change the size, type a new value in the box or select a value from the drop-down list.
  - **Issue warning at (GB)**: This box shows the maximum storage limit for the archive mailbox before a warning is issued to the user. If the archive mailbox size reaches or exceeds the value specified, Exchange sends a warning message to the user. To change this limit, type a new value in the box or select a value from the drop-down list.
- **Delivery Options**: Use Delivery Options to forward email messages sent to the user to another recipient and to set the maximum number of recipients that the user can send a message to. Click **Edit details** to view and change these settings.
  - **Forwarding address**: Select the **Enable forwarding** check box and then click **Browse** to display the **Select Mail User and Mailbox** page. Use this page to select a recipient to whom you want to forward all email messages that are sent to this mailbox. Messages will be delivered to both the linked mailbox and the forwarding address.
  - **Recipient limit**: This setting controls the maximum number of recipients the user can send a message to. Select the **Maximum recipients** check box to limit the number of recipients allowed on the To:, Cc:, and Bcc: lines of an email message, and then specify the maximum number of recipients.

    > **NOTE**
    >
    > For on-premises Exchange organizations, the recipient limit is unlimited. For Exchange Online organizations, the limit is 500 recipients.

- **Message Size Restrictions**: These settings control the size of messages that the user can send and receive. Click **Edit details** to view and change the maximum size for sent and received messages.
  - **Sent messages**: To specify a maximum size for messages sent by this user, select the **Maximum message size (KB)** check box and type a value in the box. The message size must be between 0 and 2,097,151 KB. If the user sends a message larger than the specified size, the message will be returned to the user with a descriptive error message.

  - **Received messages**: To specify a maximum size for messages received by this user, select the **Maximum message size (KB)** check box and type a value in the box. The message size must be between 0 and 2,097,151 KB. If the user receives a message larger than the specified size, the message will be returned to the sender with a descriptive error message.

- **Message Delivery Restrictions**: These settings control who can send email messages to this user. Click **Edit details** to view and change these restrictions.

  - **Accept messages from**: Use this section to specify who can send messages to this user.

  - **All senders**: Select this option to specify that the user can accept messages from all senders. This includes both senders in your Exchange organization and external senders. This option is selected by default. This option includes external users only if you clear the **Require that all senders are authenticated** check box. If you select this check box, messages from external users will be rejected.

  - **Only senders in the following list**: Select this option to specify that the user can accept messages only from a specified set of senders in your Exchange organization. Click **Add** to display the **Select Recipients** page, which displays a list of all recipients in your Exchange organization. Select the recipients you want, add them to the list, and then click **OK**. You can also search for a specific recipient by typing the recipient's name in the search box and then clicking **Search**.

  - **Require that all senders are authenticated**: Select this option to prevent anonymous users from sending messages to the user.

  - **Reject messages from**: Use this section to block people from sending messages to this user.

  - **No senders**: Select this option to specify that the mailbox won't reject messages from any senders in the Exchange organization. This option is selected by default.

  - **Senders in the following list**: Select this option to specify that the mailbox will reject messages from a specified set of senders in your Exchange organization. Click **Add** to display the **Select Recipient** page, which displays a list of all recipients in your Exchange organization. Select the recipients you want to reject messages from, add them to the list, and then click **OK**. You can also search for a specific recipient by typing the recipient's name in the search box and then clicking **Search**.

Member Of

Use the **Member Of** section to view a list of the distribution groups or security groups to which this user belongs. You can't change membership information on this page. Note that the user may match the criteria for one or more dynamic distribution groups in your organization. However, dynamic distribution groups aren't displayed on this page because their membership is calculated each time they're used.

MailTip

Use the **MailTip** section to add a MailTip to alert users of potential issues if they send a message to this recipient. A MailTip is text that's displayed in the InfoBar when a recipient is added to the To, Cc, or Bcc lines of a new email message.

> **NOTE**
>
> MailTips can include HTML tags, but scripts aren't allowed. The length of a custom MailTip can't exceed 175 displayed characters. HTML tags aren't counted in the limit.

Mailbox Delegation

Use the **Mailbox Delegation** section to assign permissions to other users (also called *delegates*) to allow them to sign in to the user's mailbox or send messages on behalf of the user. You can assign the following permissions:

- **Send As**: This permission allows users other than the mailbox owner to use the mailbox to send messages.

After this permission is assigned to a delegate, any message that a delegate sends from this mailbox will appear as if it was sent by the mailbox owner. However, this permission doesn't allow a delegate to sign in to the user's mailbox.

- **Send on Behalf Of**: This permission also allows a delegate to use this mailbox to send messages. However, after this permission is assigned to a delegate, the **From:** address in any message sent by the delegate indicates that the message was sent by the delegate on behalf of the mailbox owner.

- **Full Access**: This permission allows a delegate to sign in to the user's mailbox and view the contents of the mailbox. However, after this permission is assigned to a delegate, the delegate can't send messages from the mailbox. To allow a delegate to send email from the user's mailbox, you still have to assign the delegate the Send As or the Send on Behalf Of permission.

To assign permissions to delegates, click **Add** under the appropriate permission to display the **Select Recipient** page, which displays a list of all recipients in your Exchange organization that can be assigned the permission. Select the recipients you want assign delegate permissions to, add them to the list, and then click **OK**. You can also search for a specific recipient by typing the recipient's name in the search box and then clicking **Search**.

Use the Exchange management Shell to change linked mailbox properties

Use the **Get-Mailbox** and **Set-Mailbox** cmdlets to view and change properties for linked mailboxes. One advantage of using the Exchange Management Shell is the ability to change the properties for multiple linked mailboxes. For information about what parameters correspond to mailbox properties, see the following topics:

- Get-Mailbox

- Set-Mailbox

Here are some examples of using the Exchange Management Shell to change linked mailbox properties.

This example uses the **Get-Mailbox** command to find all the linked mailboxes in the organization.

```
Get-Mailbox -ResultSize unlimited -Filter "RecipientTypeDetails -eq 'LinkedMailbox'"
```

This example uses the **Set-Mailbox** command to limit the number of recipients allowed on the To:, Cc:, and Bcc: lines of an email message to 500. This limit applies to all linked mailboxes in the organization.

```
Get-Mailbox -ResultSize unlimited -Filter "RecipientTypeDetails -eq 'LinkedMailbox'" | Set-Mailbox -
RecipientLimits 500
```

This example changes the linked master account in the fabrikam.com account forest that is associated with a linked mailbox in an Exchange forest.

```
Set-Mailbox -Identity "Ayla Kol" -LinkedDomainController DC1.fabrikam.com -LinkedMasterAccount
"fabrikam\robinw" -LinkedCredential:(Get-Credential fabrikam\administrator)
```

How do you know this worked?

To verify that you have successfully changed properties for a linked mailbox, do the following:

- In the EAC, select the linked mailbox and then click **Edit** to view the property or feature that you changed. Depending on the property that you changed, it might be displayed in the Details pane for the selected mailbox.

- In the Exchange Management Shell, use the **Get-Mailbox** cmdlet to verify the changes. One advantage of using the Exchange Management Shell is that you can view multiple properties for multiple linked mailboxes. In the example above where the recipient limit was changed, running the following command will verify the new value.

```
Get-Mailbox -ResultSize unlimited -Filter "RecipientTypeDetails -eq 'LinkedMailbox'" | Format-List
Name,RecipientLimits
```

For the example above where the linked master account was changed, run the following command to verify the new value.

```
Get-Mailbox "Ayla Kol" | Format-List LinkedMasterAccount
```

Manage distribution groups

8/3/2020 • 15 minutes to read • Edit Online

Use the Exchange admin center (EAC) or the Exchange Management Shell to create a new distribution group in your Exchange organization or to mail-enable an existing group in Active Directory.

There are two types of groups that can be used to distribute messages:

- *Mail-enabled universal distribution groups* (also called *distribution groups*) can be used only to distribute messages.

- *Mail-enabled universal security groups* (also called *security groups*) can be used to distribute messages as well as to grant access permissions to resources in Active Directory. For more information, see Manage mail-enabled security groups in Exchange Server.

It's important to note the terminology differences between Active Directory and Exchange. In Active Directory, a distribution group refers to any group that doesn't have a security context, whether it's mail-enabled or not. In contrast, in Exchange, all mail-enabled groups are referred to as distribution groups, whether they have a security context or not.

NOTE

You can create or mail-enable only universal distribution groups. To convert a domain-local or a global group to a universal group, you can use the Set-Group cmdlet using the Exchange Management Shell. You may have mail-enabled groups that were migrated from previous versions of Exchange that are not universal groups. You can use the EAC or the Exchange Management Shell to manage these groups

What do you need to know before you begin?

- Estimated time to complete: 2 to 5 minutes.

- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Distribution groups" entry in the Recipients Permissions topic.

- If your organization has configured a group naming policy, it's applied only to groups created by users. When you or other administrators use the EAC to create distribution groups, the group naming policy is ignored and isn't applied to the group name. However, if you use the Exchange Management Shell to create or rename a distribution group, the policy is applied unless you use the *IgnoreNamingPolicy* parameter to override the group naming policy. For more information, see:

  - Create a Distribution Group Naming Policy

  - Override the Distribution Group Naming Policy

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

TIP

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Create a distribution group

Use the EAC to create a distribution group

1. In the EAC, navigate to **Recipients** > **Groups**.

2. Click **New** + > **Distribution group**.

3. On the **New distribution group** page, complete the following boxes:

   - *** Display name**: Use this box to type the display name. This name appears in your organization's address book, on the To: line when email is sent to this group, and in the Groups list in the EAC. The display name is required and should be user-friendly so people recognize what it is. It also must be unique in the forest.

   - *** Alias**: Use this box to type the name of the alias for the group. The alias can't exceed 64 characters and must be unique in the forest. When a user types the alias in the To: line of an email message, it resolves to the group's display name.

   - **Description**: Use this box to describe the group so people know what the purpose of the group is. This description appears in the address book.

   - **Organizational unit**: You can select an organizational unit (OU) other than the default (which is the recipient scope). If the recipient scope is set to the forest, the default value is set to the Users container in the Active Directory domain that contains the computer on which the EAC is running. If the recipient scope is set to a specific domain, the Users container in that domain is selected by default. If the recipient scope is set to a specific OU, that OU is selected by default.

     To select a different OU, click **Browse**. The dialog box displays all OUs in the forest that are within the specified scope. Select the OU you want, and then click **OK**.

   - *** Owners**: By default, the person who creates a group is the owner. All groups must have at least one owner. You can add owners by clicking **Add** +.

   - **Members**: Use this section to add members and to specify whether approval is required for people to join or leave the group.

     Group owners don't have to be members of the group. Use **Add group owners as members** to add or remove the owners as members.

     To add members to the group, click **Add** +. When you've finished adding members, click **OK** to return to the **New distribution group** page.

     Under **Choose whether owner approval is required to join the group**, specify whether approval is required for people to join the group. Select one of the following settings:

     - **Open: Anyone can join this group without being approved by the group owners**: This is the default setting.

     - **Closed: Members can be added only by the group owners. All requests to join will be rejected automatically**

   - **Owner Approval: All requests are manually approved or rejected by the group owners**: If you select this option, the group owner or owners will receive an email message requesting approval to join the group.

     Under **Choose whether the group is open to leave**, specify whether approval is required for people to leave the group. Select one of the following settings:

   - **Open: Anyone can leave this group without being approved by the group owners**: This is the default setting.

  - **Closed**: Members can be removed only by the group owners. All requests to leave will be rejected automatically

4. When you've finished, click **Save** to create the distribution group.

> **NOTE**
>
> By default, new distribution groups require that all senders be authenticated. This prevents external senders from sending messages to distribution groups. To configure a distribution group to accept messages from all senders, you must modify the message delivery restriction settings for that distribution group.

Use the Exchange Management Shell to create a distribution group

This example creates a distribution group with an alias **itadmin** and the name **IT Administrators**. The distribution group is created in the default OU, and anyone can join this group without approval by the group owners.

```
New-DistributionGroup -Name "IT Administrators" -Alias itadmin -MemberJoinRestriction open
```

For more information about using the Exchange Management Shell to create distribution groups, see New-DistributionGroup.

How do you know this worked?

To verify that you've successfully created a distribution group, do one of the following:

- In the EAC, navigate to **Recipients** > **Groups**. The new distribution group is displayed in the group list. Under **Group Type**, the type is **Distribution group**.

- In the Exchange Management Shell, run the following command to display information about the new distribution group.

  ```
  Get-DistributionGroup <Name> | Format-List Name,RecipientTypeDetails,PrimarySmtpAddress
  ```

Change distribution group properties

Use the EAC to change distribution group properties

1. In the EAC, navigate to **Recipients** > **Groups**.

2. In the list of groups, click the distribution group that you want to view or change, and then click **Edit** ✎.

3. On the group properties page, click one of the following sections to view or change properties.

   - General
   - Ownership
   - Membership
   - Membership approval
   - Delivery management
   - Message approval
   - Email options

- MailTip
- Group delegation

General

Use this section to view or change basic information about the group.

- *** Display name**: This name appears in the address book, on the To: line when email is sent to this group, and in the Groups list. The display name is required and should be user-friendly so people recognize what it is. It also has to be unique in your domain.

  If you've implemented a group naming policy, the display name has to conform to the naming format defined by the policy.

- *** Alias**: This is the portion of the email address that appears to the left of the at (@) symbol. If you change the alias, the primary SMTP address for the group will also be changed, and contain the new alias. Also, the email address with the previous alias will be kept as a proxy address for the group.
- **Description**: Use this box to describe the group so people know what the purpose of the group is. This description appears in the address book and in the Details pane in the EAC.
- **Hide this group from address lists**: Select this check box if you don't want users to see this group in the address book. To send email to this group, a sender has to type the group's alias or email address on the To: or Cc: lines.

  > **TIP**
  >
  > Consider hiding security groups because they're typically used to assign permissions to group members and not to send email.

- **Organizational unit**: This read-only box displays the organizational unit (OU) that contains the distribution group. You have to use Active Directory Users and Computers to move the group to a different OU.

Ownership

Use this section to assign group owners. The group owner can add members to the group, approve or reject requests to join or leave the group, and approve or reject messages sent to the group. By default, the person who creates a group is the owner. All groups must have at least one owner.

You can add owners by clicking **Add** +. You can remove an owner by selecting the owner and then clicking **Remove** −.

Membership

Use this section to add or remove members. Group owners don't have to be members of the group. Under **Members**, you can add members by clicking **Add** +. You can remove a member by selecting a user in the member list and then clicking **Remove** −.

Membership approval

Use this section to specify whether approval is required for users to join or leave the group.

- **Choose whether owner approval is required to join the group**: Select one of the following settings:
  - **Open: Anyone can join this group without being approved by the group owners**
  - **Closed: Members can be added only by the group owners. All requests to join will be rejected automatically**
  - **Owner Approval: All requests are approved or rejected by the group owners**: If you select this option, the group owner or owners receive an email requesting approval to join the group.

- **Choose whether the group is open to leave**: Select one of the following settings:
  - **Open: Anyone can leave this group without being approved by the group owners**
  - **Closed: Members can be removed only by the group owners. All requests to leave will be rejected automatically**

Delivery management

Use this section to manage who can send email to this group.

- **Only senders inside my organization**: Select this option to allow only senders in your organization to send messages to the group. This means that if someone outside of your organization sends an email message to this group, it will be rejected. This is the default setting.
- **Senders inside and outside of my organization**: Select this option to allow anyone to send messages to the group.

  You can further limit who can send messages to the group by allowing only specific senders to send messages to this group. Click **Add** + and then select one or more recipients. If you add senders to this list, they are the only ones who can send mail to the group. Mail sent by anyone not in the list will be rejected.

  To remove a person or a group from the list, select them in the list and then click **Remove** −.

> **IMPORTANT**
>
> If you've configured the group to allow only senders inside your organization to send messages to the group, email sent from a mail contact will be rejected, even if they are added to this list.

Message approval

Use this section to set options for moderating the group. Moderators approve or reject messages sent to the group before they reach the group members.

- **Messages sent to this group have to be approved by a moderator**: This check box isn't selected by default. If you select this check box, incoming messages are reviewed by the group moderators before delivery. Group moderators can approve or reject incoming messages.
- **Group moderators**: To add group moderators, click **Add** +. To remove a moderator, select the moderator, and then click **Remove** −. If you've selected "Messages sent to this group have to be approved by a moderator" and you don't select a moderator, messages to the group are sent to the group owners for approval.
- **Senders who don't require message approval**: To add people or groups that can bypass moderation for this group, click **Add** +. To remove a person or a group, select the item, and then click **Remove** −.
- **Select moderation notifications**: Use this section to set how users are notified about message approval.
  - **Notify all senders when their messages aren't approved**: This is the default setting. Notify all senders, inside and outside your organization, when their message isn't approved.
  - **Notify senders in your organization when their messages aren't approved**: When you select this option, only people or groups in your organization are notified when a message that they sent to the group isn't approved by a moderator.
  - **Don't notify anyone when a message isn't approved**: When you select this option, notifications aren't sent to message senders whose messages aren't approved by the group moderators.

Email options

Use this section to view or change the email addresses associated with the group. This includes the group's primary SMTP addresses and any associated proxy addresses. The primary SMTP address (also known as the *reply* *address*) is displayed in bold text in the address list, with the uppercase **SMTP** value in the **Type** column.

- **Add**: Click **Add** + to add a new email address for this mailbox. Select one of following address types:
  - **SMTP**: This is the default address type. Click this button and then type the new SMTP address in the *** Email address** box.
  - **Custom address type**: Click this button and type one of the supported non-SMTP email address types in the *** Email address** box.

    > **NOTE**
    >
    > With the exception of X.400 addresses, Exchange doesn't validate custom addresses for correct formatting. You must make sure that the custom address you specify complies with the format requirements for that address type.

- **Edit**: To change an email address associated with the group, select it in the list, and then click **Edit** ✎.
- **Remove**: To delete an email address associated with the group, select it in the list, and then click **Remove** −.
- **Automatically update email addresses based on the email address policy applied to this recipient**: Select this check box to have the recipient's email addresses automatically updated based on changes made to email address policies in your organization. This box is selected by default.

MailTip

Use this section to add a MailTip to alert users of potential issues if they send a message to this group. A MailTip is text that's displayed in the InfoBar when this group is added to the To, Cc, or Bcc lines of a new email message. For example, you could add a MailTip to large groups to warn potential senders that their message will be sent to lots of people.

> **NOTE**
>
> MailTips can include HTML tags, but scripts aren't allowed. The length of a custom MailTip can't exceed 175 displayed characters. HTML tags aren't counted in the limit.

Group delegation

Use this section to assign permissions to a user (called a *delegate*) to allow them to send messages as the group or send messages on behalf of the group. You can assign the following permissions:

- **Send As**: This permission allows the delegate to send messages as the group. After this permission is assigned, the delegate has the option to add the group to the **From** line to indicate that the message was sent by the group.
- **Send on Behalf Of**: This permission also allows a delegate to send messages on behalf of the group. After this permission is assigned, the delegate has the option to add the group in the **From** line. The message will appear to be sent by the group and will say that it was sent by the delegate on behalf of the group.

To assign permissions to delegates, click **Add** under the appropriate permission to display the **Select Recipient** page, which displays a list of all recipients in your Exchange organization that can be assigned the permission. Select the recipients you want, add them to the list, and then click **OK**. You can also search for a specific recipient by typing the recipient's name in the search box and then clicking **Search**.

Use the Exchange Management Shell to change distribution group properties

Use the **Get-DistributionGroup** and **Set-DistributionGroup** cmdlets to view and change properties for distribution groups. Advantages of using the Exchange Management Shell are the ability to change the properties that aren't available in the EAC and to change properties for multiple groups. For information about which parameters correspond to distribution group properties, see the following topics:

- Get-DistributionGroup
- Set-DistributionGroup

Here are some examples of using the Exchange Management Shell to change distribution group properties.

This example changes the primary SMTP address (also called the reply address) for the Seattle Employees distribution group from employees@contoso.com to sea.employees@contoso.com. Also, the previous reply address will be kept as a proxy address.

```
Set-DistributionGroup "Seattle Employees" -EmailAddresses
SMTP:sea.employees@contoso.com,smtp:employees@contoso.com
```

This example limits the maximum message size that can be sent to all distribution groups in the organization to 10 megabytes (MB).

```
Get-DistributionGroup -ResultSize unlimited -Filter "RecipientTypeDetails -eq
'MailUniversalDistributionGroup'" | Set-DistributionGroup -MaxReceiveSize 10MB
```

This example enables moderation for the distribution group Customer Support and sets the moderator to Amy. In addition, this moderated distribution group will notify senders who send mail from within the organization if their messages aren't approved.

```
Set-DistributionGroup -Identity "Customer Support" -ModeratedBy "Amy" -ModerationEnabled $true -
SendModerationNotifications 'Internal'
```

This example changes the user-created distribution group Dog Lovers to require the group manager to approve users' requests to join the group. In addition, by using the *BypassSecurityGroupManagerCheck* parameter, the group manager will not be notified that a change was made to the distribution group's settings.

```
Set-DistributionGroup -Identity "Dog Lovers" -MemberJoinRestriction 'ApprovalRequired' -
BypassSecurityGroupManagerCheck
```

How do you know this worked?

To verify that you've successfully changed properties for a distribution group, do the following:

- In the EAC, select the group and then click **Edit** ✎ to view the property or feature that you changed. Depending on the property that you changed, it might be displayed in the Details pane for the selected group.

- In the Exchange Management Shell, use the **Get-DistributionGroup** cmdlet to verify the changes. One advantage of using the Exchange Management Shell is that you can view multiple properties for multiple groups. In the example above where the recipient limit was changed, run the following command to verify the new value.

  ```
  Get-Mailbox -ResultSize unlimited -Filter "RecipientTypeDetails -eq 'UserMailbox'" | Format-List
  Name,RecipientLimits
  ```

  For the example above where the message limits were changed, run this command.

```
Get-Mailbox -OrganizationalUnit "Marketing" | Format-List
Name,IssueWarningQuota,ProhibitSendQuota,ProhibitSendReceiveQuota,UseDatabaseQuotaDefaults
```

Manage mail-enabled security groups in Exchange Server

8/3/2020 • 23 minutes to read • Edit Online

You can use mail-enabled security groups to distribute messages as well as grant access permissions to resources in Exchange and Active Directory. You can create, modify, and remove mail-enabled security groups in the Exchange admin center (EAC) or in the Exchange Management Shell. For more information about mail-enabled security groups, see Recipients.

What do you need to know before you begin?

- Estimated time to complete each procedure: 5 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Distribution groups" entry in the Recipients Permissions topic.
- For more information about accessing and using the EAC, see Exchange admin center in Exchange Server.
- To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.
- If you add users to or remove users from a mail-enabled security group, the users need to log out and log in for the permission changes to take effect.
- For mail-enabled security groups, users can't add or remove themselves from the group, nor can they send requests to the group owners to join or leave the group. A group owner needs to manually add and remove group members from a mail-enabled security group.
- If a mail-enabled security group contains members that aren't mail-enabled, a non-delivery report (also known as an NDR or bounce message) is returned for those non-mail-enabled members when you send a message to the group. To prevent NDRs, you can expand the group members in the **To** field of the message before you send the message (only the mail-enabled members of the group will appear).
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

Create mail-enabled security groups

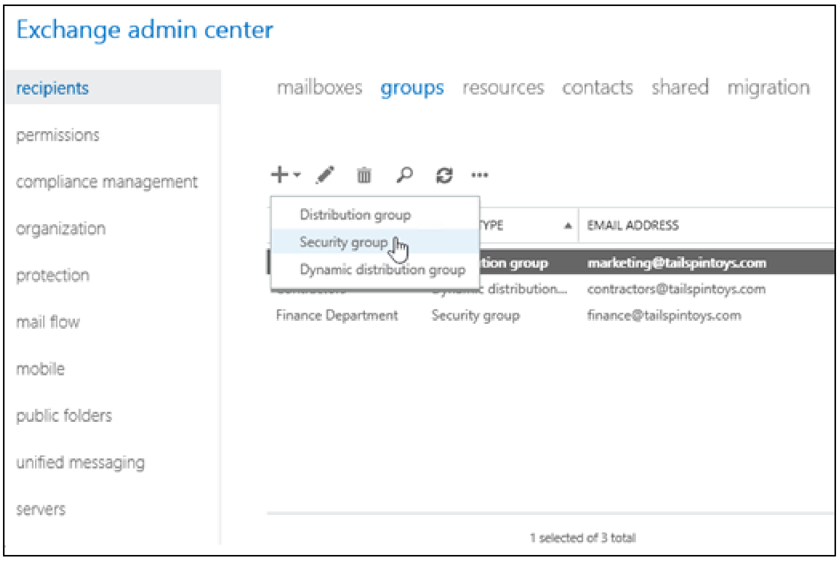
- When you create groups in the EAC, the value of the **Display name** property is used for the value of the unseen **Name** property (the unique identifier for the group object in the forest). Because the value of **Name** has a maximum length of 64 characters, the value of **Display name** also has a maximum length of 64 characters when you create groups in the EAC.
- When you create groups in the Exchange Management Shell, the *Name* parameter is required, the value must be unique, and the value has a maximum length of 64 characters. The *DisplayName* parameter is optional (the value of *Name* is used if you don't use it), the value isn't required to be unique, and the value has a maximum length of 256 characters.

- When you create groups in the EAC, the groups are automatically configured to only accept messages from authenticated (internal) senders. When you create groups in the Exchange Management Shell, you can use the *RequireSenderAuthenticationEnabled* parameter with the value `$false` so the group can accept messages from authenticated an unauthenticated (internal and external) senders. After you create the group, you can use the EAC or the Exchange Management Shell to change this setting.

Use the EAC to create a mail-enabled security group

1. In the EAC, go to **Recipients** > **Groups**.

2. Click **New** ➕ and then select **Security group** in the drop down list that appears.



3. On the **New security group** page that opens, configure these settings (values marked with an * are required):

   - * **Display name**: This value should help users immediately recognize what the group is used for. This name appears in the global address list, on the To: line when email is sent to this group, and in the **Groups** list in the EAC. The maximum length in the EAC is 64 characters, and the value must be unique.

     > **NOTE**
     >
     > If a group naming policy is applied, you need to follow the naming constraints that are enforced for your organization. For more information, see Create a Distribution Group Naming Policy. If you want to override your organization's group naming policy, see Override a Distribution Group Naming Policy.

   - * **Alias**: This value is used to generate the primary email address (*<alias>*@ *<domain>*). This value can contain letters, numbers and the characters !, #, $, %, &, ', *, +, -, /, =, ?, ^, _, `, {, |, } and ~. Periods (.) are allowed, but each period must be surrounded by other valid characters (for example, help.desk). Unicode characters from U+00A1 to U+00FF are also allowed, but are mapped to best-fit US-ASCII text characters in the primary email address (for example, U+00F6 (ö) is changed to oe). The alias can't exceed 64 characters and must be unique in the forest. When a user types the alias on the To: line of an email message, it resolves to the group's display name.

   - **Notes**: Use this box to describe the purpose of the group. This description appears in the global address list and in the details pane in the EAC.

   - **Organizational unit**: The default location in Active Directory depends on the recipient scope that's configured:

     - If the recipient scope is the Active Directory forest, the default location is the Users container in the domain where the computer that's running the EAC is located.

  - If the recipient scope is a specific domain, the default location is the Users container in that domain.

  - If the recipient scope is a specific organizational unit (OU), the default location is that OU.

  To select a different OU, click **Browse**. The **Select an organizational unit** dialog box that opens shows all of the available OUs in the forest that are within the specified recipient scope. Select the desired OU, and then click **OK**.

- *** Owners**: By default, the person who creates the group is the owner. All groups must have at least one owner. Group owners can:

  - Modify the properties of the group

  - Add or remove group members

  - Delete the group

  - Approve messages sent to the group (if moderation is enabled)

  To add owners, click **Add** +. In the **Select Owners** dialog that appears, select one or more owners, click **Add**, and then click **OK**.

  To remove owners, select the owner in the list, and then click **Remove** −.

- **Members**

  To add members to the group, click **Add** +. In the **Select Members** dialog that appears, select one or more members, click **Add**, and then click **OK**.

  To remove members, select the member in the list, and then click **Remove** −.

- **Add group owners as members**: When this check box is selected, you don't need to manually include group owners in the list of members. If you don't want the group owners to be members of the group, clear this check box.

- **Owner approval is required**: For mail-enabled security groups, user requests to join the group aren't sent to the group owners, regardless of the state of this check box (selected or not selected). A group owner needs to manually add and remove group members from a mail-enabled security group.

When you've finished, click **Save**.

Use the Exchange Management Shell to create a mail-enabled security group

To create a mail-enabled security group, use this syntax:

```
New-DistributionGroup -Type Security -Name <UniqueName> [-IgnoreNamingPolicy] [-Alias <Alias>] [-DisplayName "
<DisplayName>"] [-Notes "<Description>"] [-OrganizationalUnit <OU>] [-ManagedBy "<owner1>","<owner2>"...] [-
Members "<member1>","<member2>"...] [-CopyOwnerToMember] [-MemberJoinRestriction <Closed | ApprovalRequired>]
[-RequireSenderAuthenticationEnabled <$true | $false>]
```

This example creates a security group with these settings:

- **Name**: File Server Managers. This value is also used for the display name because we aren't using the *DisplayName* parameter. If a group naming policy is applied, you can use the *IgnoreNamingPolicy* switch to override the policy.

- **Alias**: fsadmin. If we didn't use the *Alias* parameter, the value of the *Name* parameter would be used, with spaces removed (FileServerManagers in this example).

- **Description**: None, because we aren't using the *Notes* parameter.

- **Organizational Unit**: The default location that's specified by the recipient scope, because we aren't using the *OrganizationalUnit* parameter.

- **Owners**: The user account that's creating the group is the only owner, because we aren't using the *ManagedBy* parameter.

- **Members**: Bishamon Tamura and Valeria Barrios. Because we're using the *CopyOwnerToMember* switch, the group owner is also a member.

- **User requests to join the group**: For mail-enabled security groups, user requests to join the group aren't sent to the group owners, regardless of the *MemberJoinRestriction* parameter value (`ApprovalRequired` or `Closed`). A group owner needs to manually add and remove group members from a mail-enabled security group.

- **Accept messages from external senders**: No, because we're aren't using the *RequireSenderAuthenticationEnabled* parameter, and the default value is `$true`.

```
New-DistributionGroup -Type Security -Name "File Server Managers" -Alias fsadmin -Members "Bishamon
Tamura","Valeria Barrios" -CopyOwnerToMember
```

For detailed syntax and parameter information, see New-DistributionGroup.

How do you know this worked?

To verify that you've successfully created a mail-enabled security group, do any of these steps:

- In the EAC, go to **Recipients** > **Groups**. Verify that the group is listed, and the **Group Type** value is **Security group**.

- In the Exchange Management Shell, run this command and verify that the group is listed:

  ```
  Get-DistributionGroup -Filter "RecipientType -eq 'MailUniversalSecurityGroup'"
  ```

- In the Exchange Management Shell, replace *<GroupIdentity>* with the identity of the group (for example, name, alias, or email address), and run this command to verify the property values:

  ```
  Get-DistributionGroup -Identity <GroupIdentity> | Format-List
  ```

View or modify mail-enabled security groups

- When you modify groups in the EAC, the maximum length for the **Display name** property is now 256 characters, and the value doesn't need to be unique. This value no longer affects the value of the unseen **Name** property (the unique identifier for the group object in the forest). You can't use the EAC to modify the **Name** value of an existing group.

- When you modify groups in the Exchange Management Shell, the maximum length for the *Name* parameter value is still 64 characters, and the value must be unique. The maximum length for the *DisplayName* parameter value is still 256 characters, and the value doesn't need to be unique.

Use the EAC to view or modify a mail-enabled security group

1. In the EAC, go to **Recipients** > **Groups**.

2. In the list of groups, find the mail-enabled security group that you want to view or modify. You can:

   - Scroll through the list of groups.

   - Click **Search** 🔍 and enter part of the group's name, email address, or alias.

   - Click **More options** ••• > **Advanced search** to find the group.

   - Click the **Group Type** column header to sort the groups by **Security group**.

     Once you've found the mail-enabled security group that you want to modify, select it, and then click **Edit** ✎.

3. On the **Edit Security Group** page that opens, click one of the tabs to view or change the settings of the group:

   - General

   - Ownership

   - Membership

   - Membership approval

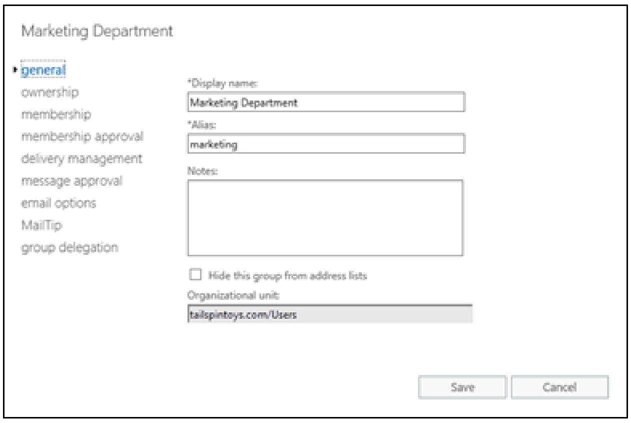
   - Delivery management

   - Message approval

   - Email options

   - MailTip

   - Group delegation



Marketing Department

*Display name:
Marketing Department

*Alias:
marketing

Notes:

□ Hide this group from address lists

Organizational unit:
tailspintoys.com/Users

   When you're finished, click **Save** or **Cancel**.

General

Use this tab to view or change basic information about the group.

- **Display name**: This value should help users immediately recognize what the group is used for. This name appears in the global address list, on the To: line when email is sent to this group, and in the **Groups** list in the EAC. The maximum length is 256 characters, and the value doesn't need to be unique.

- **Alias**: This value is used to generate the primary email address (*<alias>*@ *<domain>*). This value can contain letters, numbers and the characters !, #, $, %, &, ', *, +, -, /, =, ?, ^, _, `, {, |, } and ~. Periods (.) are allowed, but each period must be surrounded by other valid characters (for example, help.desk). Unicode characters from U+00A1 to U+00FF are also allowed, but are mapped to best-fit US-ASCII text characters in the primary email address (for example, U+00F6 (ö) is changed to oe). The alias can't exceed 64 characters and must be unique in the forest. When a user types the alias on the To: line of an email message, it resolves to the group's display name.

When you change the alias value, the previous primary email address is kept as a proxy address for the group.

- **Notes**: Use this box to describe the purpose of the group. This description appears in the global address list and in the details pane in the EAC.
- **Hide this group from address lists**: Select this check box if you don't want users to see the group in the global address list. If this check box is selected, a sender has to know and type the group's alias or email address to send messages to the group.
- **Organizational unit**: This read-only box displays the location of the group object in Active Directory. You need to use Active Directory Users and Computers to move the group to a different OU.

Ownership

Use this section to assign group owners. All groups must have at least one owner. Group owners can:

- Modify the properties of the group
- Add or remove group members
- Delete the group
- Approve member depart or join requests (if available)
- Approve messages sent to the group (if moderation is enabled)

To add owners, click **Add** +. In the **Select Owners** dialog that appears, select one or more owners, click **Add**, and then click **OK**.

To remove owners, select the owner in the list, and then click **Remove** −.

Membership

Use this tab to add or remove group members. Group owners aren't required to be members of the group.

To add members to the group, click **Add** +. In the **Select Members** dialog that opens, select one or more members, click **Add**, and then click **OK**.

To remove members, select the member in the list, and then click **Remove** −.

Membership approval

For mail-enabled security groups, user requests to join the group aren't sent to the group owners, regardless of the state of the **Owner approval is required** check box (selected or not selected). A group owner needs to manually add or remove group members from a mail-enabled security group.

Delivery management

Use this tab to control who's allowed to send messages to the group.

- **Only senders inside my organization**: The group only accepts messages from authenticated (internal) senders. This is the default setting.
- **Senders inside and outside of my organization**: The group accepts messages from authenticated and unauthenticated (internal and external) senders.
- Restrict the internal senders who can send messages to the group by clicking **Add** +. In the **Select Allowed Senders** dialog that appears, select one or more senders, click **Add**, and then click **OK**. Only the specified senders can send messages to the group.

  To remove internal senders that are allowed to send messages to the group, select the sender in the list, and then click **Remove** −.

IMPORTANT

Mail contacts are always considered unauthenticated (external) senders. If you select **Only senders inside my organization** and add the mail contact to the list of approved internal senders, messages sent to the group by the mail contact will be rejected.

Message approval

Use this tab to configure the moderation settings for messages that are sent to the group.

- **Messages sent to this group have to be approved by a moderator**: This check box isn't selected by default. If you select this check box, messages that are sent to the group must be approved by the specified moderators before they're delivered to the group members. When you select this option, you can configure these additional settings:

  - **Group moderators**: For mail-enabled security groups, the group owners aren't automatically used as moderators. You need to specify at least one moderator here when moderation is enabled.

    To add moderators, click **Add** +. In the **Select Group Moderators** dialog that appears, select one or more moderators (which can include any of the group owners), click **Add**, and then click **OK**.

    To remove moderators, select the moderator in the list, and then click **Remove** −.

  - **Senders who don't require message approval**: To configure senders who can bypass moderation for the group (send messages directly to the group members), click **Add** +. In the **Select Senders** dialog that appears, select one or more senders, click **Add**, and then click **OK**.

    To remove senders, select the sender in the list, and then click **Remove** −.

    You don't need to include moderators in the list of senders who bypass moderation. Messages that are sent to the group by a moderator aren't moderated.

  - **Select moderation notifications**: This setting configures how message senders are notified when their messages aren't approved by a moderator:

  - **Notify all senders when their messages aren't approved**: Authenticated and unauthenticated (internal and external) senders are notified when their messages aren't approved by a group moderator. This is the default value.

  - **Notify senders in your organization when their messages aren't approved**: Only authenticated (internal) senders are notified when their messages aren't approved by a group moderator.

  - **Don't notify anyone when a message isn't approved**: Senders aren't notified when their messages aren't approved by a group moderator.

Email options

Use this tab to view or change the email addresses that are configured for the group.

- **Email address**: By default, you use this setting to add additional email addresses for the group (also known as proxy addresses).

  By default, the primary email address (also known as the Reply To or reply address) is configured by the email address policy that's applied to the group. For more information about email address policies, see Email address policies in Exchange Server. The primary email address that's shown here is bold, and has the uppercase **SMTP** value in the **Type** column.

  To manually specify the group's primary email address here, you need to clear the check box **Automatically update email addresses based on the email address policy applied to this**

recipient. Note that clearing this check box prevents automatic updates to the email addresses of the group by email address policies.

  - To add a new email address for the group, click **Add** ＋. In the **New email address** page that opens, select one of these options:

  - **Email address type**: Select **SMTP**. In the **Email address** box, type the email address (for example, helpdesk@contoso.com). The domain must be an accepted domain that's configured for your organization. For more information, see Accepted domains in Exchange Server.

  - On the previous page, if you left **Automatically update email addresses based on the email address policy applied to this recipient** check box selected, the email address is added to the group as a proxy address (there's no **Make this the reply address** check box on this page).

  - On the previous page, if you cleared the **Automatically update email addresses based on the email address policy applied to this recipient** check box, you can select **Make this the reply address**. This setting adds the new email address as the primary email address, and the previous primary email address is kept as a proxy address. If you don't select **Make this the reply address**, the email address is added as a proxy address, and the primary email address is unaffected.

  - **Email address type**: Select **Enter a custom address type**. Type the custom email address type (for example, X400). In the **Email address** box, type the custom email address.

  Note: With the exception of X.400 addresses, Exchange doesn't validate custom email addresses for correct formatting. You need to make sure that the custom email address complies with the format requirements for that address type.

  When you're finished, click **OK**.

  - To modify an existing email address for the group, select it in the list, and then click **Edit** ✎. Note that you can't change the email address type, just the email address.

  - To remove an existing email address from the group, select it in the list, and then click **Remove** −. Note that you can't remove the primary email address.

MailTip

Use this tab to add a custom MailTip for the group. MailTips alert users to potential issues before they send a message to the group. For more information about MailTips, see Configure Custom MailTips for Recipients.

> **NOTE**
>
> MailTips can include HTML tags, but scripts aren't allowed. The length of a custom MailTip can't exceed 175 displayed characters. HTML tags aren't counted in the limit.

Group delegation

Use this tab to assign permissions to the group for a user (called a *delegate*).

- **Send As**: The specified users can send messages that appear to be sent by the group. The actual sender isn't revealed, and replies to these messages are delivered to the group.

- **Send on Behalf**: The specified users can send on behalf of the group. Although messages send on behalf of the group clearly show the sender in the From line (*<Sender>* on behalf of *<Group>*), replies to these messages are delivered to the group, not the sender.

To add delegates, click **Add** ＋ for the appropriate permission. In the resulting dialog that appears, select one or more delegates, click **Add**, and then click **OK**.

After you assign one of these permissions, the delegate can select the group for the **From** line in Outlook or

Outlook on the web (formerly known as Outlook Web App).

To remove delegates, select the delegate in the appropriate list, and then click **Remove** −.

Use the Exchange Management Shell to modify a mail-enabled security group

You use the **Set-DistributionGroup** cmdlet to modify mail-enabled security groups. Here are some interesting settings that you can configure using the **Set-DistributionGroup** cmdlet that aren't available in the EAC or on the **New-DistributionGroup** cmdlet:

- Configure values for the **CustomAttribute1** through **CustomAttribute15** properties (the *CustomAttribute1* through *CustomAttribute15* parameters).

- Configure MailTips in different languages (the *MailTipTranslations* parameter).

- Configure the maximum message size that can be sent to or sent from the group (the *MaxReceiveSize* and *MaxSendSize* parameters).

- Instead of specifying the internal recipients who *are* allowed to send messages to the group, you can specify the internal recipients who *aren't* allowed to send messages to the group (the *RejectMessagesFromSendersOrMembers* parameter).

For detailed syntax and parameter information, see Set-DistributionGroup.

This example configures the value DoNotMigrate for the **CustomAttribute5** property of the group named Experimental Project.

```
Set-DistributionGroup -Identity "Experimental Project" -CustomAttribute5 DoNotMigrate
```

This example adds the Spanish translation for the existing English MailTip, "Please allow 4 business days for a response to messages sent to this group" that's configured on the mail-enabled security group events@contoso.com.

```
Set-DistributionGroup -Identity events@contoso.com -MailTipTranslations @{Add="ES:Espere 4 días hábiles para
responder a los mensajes enviados a este grupo."}
```

How do you know this worked?

To verify that you've successfully modified a mail-enabled security group, do any of these steps:

- In the EAC, go to **Recipients** > **Groups** > select the mail-enabled security group (the **Group Type** value is **Security group**) > click **Edit** ✏ and verify the property values.

- In the Exchange Management Shell, replace *<GroupIdentity>* with the identity of the group (for example, name, alias, or email address), and run this command to verify the property values:

  ```
  Get-DistributionGroup -Identity <GroupIdentity> | Format-List
  ```

Use the Exchange Management Shell to view mail-enabled security groups

You use the **Get-DistributionGroup** cmdlet to view mail-enabled security groups.

This example returns a summary list of all security groups in the organization.

```
Get-DistributionGroup -ResultSize unlimited -Filter "RecipientTypeDetails -eq 'MailUniversalSecurityGroup'"
```

This example returns detailed information for the mail-enabled security group named Help Desk.

```
Get-DistributionGroup -Identity "Help Desk" | Format-List
```

For detailed syntax and parameter information, see Get-DistributionGroup.

Remove mail-enabled security groups

Use the EAC to remove a mail-enabled security group

1. In the EAC, go to **Recipients** > **Groups**.

2. In the list of groups, find the security group that you want to remove. You can:

   - Scroll through the list of groups.

   - Click **Search** 🔎 and enter part of the group's name, email address, or alias.

   - Click **More options** ••• > **Advanced search** to find the group.

   - Click the **Group Type** column header to sort the groups by **Security group**.

   Once you've found the security group that you want to remove, select it, click **Delete** 🗑, and then click **Yes** in the warning message that appears.

Use the Exchange Management Shell to remove a mail-enabled security group

To remove a mail-enabled security group, use this syntax:

```
Remove-DistributionGroup -Identity <GroupIdentity>
```

This example removes the mail-enabled security group that has the alias value contractors.

```
Remove-DistributionGroup -Identity contractors
```

How do you know this worked?

To verify that you've successfully removed a mail-enabled security group, do any of these steps:

- In the EAC, go to **Recipients** > **Groups**, and verify that the group isn't listed. Note that you might need to click **Refresh** 🔄.

- In the Exchange Management Shell, run this command and verify that the group isn't listed:

  ```
  Get-DistributionGroup -Filter "RecipientType -eq 'MailUniversalSecurityGroup'"
  ```

- In the Exchange Management Shell, replace *<GroupIdentity>* with the identity of the group (for example, name, alias, or email address), and run this command to verify that the group isn't returned:

  ```
  Get-DistributionGroup -Identity <GroupIdentity> | Format-List
  ```

- In the Exchange Management Shell, run this command and verify that the group is listed:

  ```
  Get-Group -Filter "RecipientTypeDetails -eq 'UniversalSecurityGroup'"
  ```

Mail-enable or mail-disable existing security groups

To mail-enable an existing universal security group that's not already mail-enabled, or to mail-disable an existing mail-enabled security group, you can't use the EAC. You can only use the Exchange Management Shell.

Use the Exchange Management Shell to mail-enable an existing security group

To mail-enable an existing universal security group, use this syntax:

```
Enable-DistributionGroup -Identity <GroupIdentity> [-Alias <Alias>] [-DisplayName <DisplayName>] [-
PrimarySMTPAddress <EmailAddress>]
```

This example mail-enables the existing universal security group named Help Desk with the following settings:

- **Alias**: hdesk. If we didn't use the *Alias* parameter, the value of the *Name* parameter would be used, with spaces removed (HelpDesk in this example).
- **Display name**: Because we aren't using the *DisplayName* parameter, the group's existing **Name** property value is used for the display name.
- **Primary email address**: Because we're using the *Alias* parameter, the group's primary email address is *<alias>*@ *<domain>*, where <domain> is specified by the email address policy that applies to the group. If we specified a value for the *PrimarySMTPAddress* parameter, the **EmailAddressPolicyEnabled** property would be set to the value `$false`, which means the email addresses of the group aren't automatically updated by email address policies.

```
Enable-DistributionGroup -Identity "Help Desk" -Alias hdesk
```

After you mail-enable the security group, the group will be visible to all other ***-DistributionGroup** cmdlets.

For detailed syntax and parameter information, see Enable-DistributionGroup.

How do you know this worked?

To verify that you've successfully mail-enabled an existing security group, do any of these steps:

- In the EAC, go to **Recipients** > **Groups**. Verify that the group is listed, and the **Group Type** value is **Security group**. Note that you might need to click **Refresh** ↻ if the EAC was already open.
- In the Exchange Management Shell, run this command and verify that the group is listed:

  ```
  Get-DistributionGroup -Filter "RecipientType -eq 'MailUniversalSecurityGroup'"
  ```

- In the Exchange Management Shell, replace *<GroupIdentity>* with the identity of the group (for example, name, alias, or email address), and run this command to verify the property values:

  ```
  Get-DistributionGroup -Identity <GroupIdentity> | Format-List
  ```

Use the Exchange Management Shell to mail-disable an existing mail-enabled security group

To mail-disable an existing mail-enabled universal security group, use this syntax:

```
Disable-DistributionGroup -Identity <GroupIdentity> [-IgnoreDefaultScope]
```

This example mail-disables the mail-enabled security group named Human Resources.

```
Disable-DistributionGroup -Identity "Human Resources"
```

Notes:

- If the distribution group isn't visible to you because of a restricted recipient scope, you'll need to use the *IgnoreDefaultScope* switch to see all groups in the Active Directory forest. But, when you use this switch, you'll need to identify the group by its distinguished name (DN). For example, `"CN=<Group Name>,CN=North America,CN=Users,DC=contoso,DC=com"`.
- After you mail-disable the security group, the group will be invisible to all ***-DistributionGroup** cmdlets except **Enable-DistributionGroup**.

For detailed syntax and parameter information, see Disable-DistributionGroup.

How do you know this worked?

To verify that you've successfully mail-disabled an existing mail-enabled universal security group, do any of these steps:

- In the EAC, go to **Recipients** > **Groups**, and verify that the group isn't listed. Note that you might need to click **Refresh** ⟳ if the EAC was already open.
- In the Exchange Management Shell, run this command and verify that the group isn't listed:

```
Get-DistributionGroup -Filter "RecipientType -eq 'MailUniversalSecurityGroup'"
```

- In the Exchange Management Shell, replace *<GroupIdentity>* with the name of the group, and run this command to verify that the group isn't returned:

```
Get-DistributionGroup -Identity <GroupIdentity> | Format-List
```

- In the Exchange Management Shell, run this command and verify that the group is listed:

```
Get-Group -Filter "RecipientTypeDetails -eq 'UniversalSecurityGroup'"
```

Manage dynamic distribution groups

8/3/2020 • 16 minutes to read • Edit Online

Dynamic distribution groups are mail-enabled Active Directory group objects that are created to expedite the mass sending of email messages and other information within a Microsoft Exchange organization.

Unlike regular distribution groups that contain a defined set of members, the membership list for dynamic distribution groups is calculated each time a message is sent to the group, based on the filters and conditions that you define. When an email message is sent to a dynamic distribution group, it's delivered to all recipients in the organization that match the criteria defined for that group.

> **IMPORTANT**
>
> A dynamic distribution group includes any recipient in Active Directory with attribute values that match its filter. If a recipient's properties are modified to match the filter, the recipient could inadvertently become a group member and start receiving messages that are sent to the group. Well-defined, consistent account provisioning processes will reduce the chances of this issue occurring.

What do you need to know before you begin?

- Estimated time to complete: 2 to 5 minutes.
- To open the EAC, see Exchange admin center in Exchange Server. To open the Exchange Management Shell, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Dynamic distribution groups" entry in the Recipients Permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Create a dynamic distribution group

Use the EAC to create a dynamic distribution group

1. In the EAC, navigate to **Recipients** > **Groups** > **New** > **Dynamic distribution group**.
2. On the **New dynamic distribution group** page, complete the following boxes:
   - *** Display name**: Use this box to type the display name. This name appears in the shared address book, on the To: line when email is sent to this group, and in the Groups list in the EAC. The display name is required and should be user-friendly so people recognize what it is. It also must be unique in the forest.

   > **NOTE**
   >
   > Group naming policy isn't applied to dynamic distribution groups.

- *** Alias**: Use this box to type the name of the alias for the group. The alias cannot exceed 64 characters and must be unique in the forest. When a user types the alias in the To: line of an email message, it resolves to the group's display name.

- **Description**: Use this box to describe the group so people know what the purpose of the group is. This description appears in the shared address book.

- **Organizational unit**: You can select an organizational unit (OU) other than the default (which is the recipient scope). If the recipient scope is set to the forest, the default value is set to the Users container in the Active Directory domain that contains the computer on which the EAC is running. If the recipient scope is set to a specific domain, the Users container in that domain is selected by default. If the recipient scope is set to a specific OU, that OU is selected by default.

  To select a different OU, click **Browse**. The dialog box displays all OUs in the forest that are within the specified scope. Select the OU you want, and then click **OK**.

- **Owner**: An owner for a dynamic distribution group is optional. You can add owners by clicking **Browse** and then selecting users from the list.

3. Use the **Members** section to specify the types of recipients for the group and set up rules that will determine membership. Select one of the following boxes:

   - **All recipient types**: Choose this option to send messages that meet the criteria defined for this group to all recipient types.

   - **Only the following recipient types**: Messages that meet the criteria defined for this group will be sent to one or more of the following recipient types:

   - **Users with Exchange mailboxes**: Select this check box if you want to include users that have Exchange mailboxes. Users that have Exchange mailboxes are those that have a user domain account and a mailbox in the Exchange organization.

   - **Users with external email addresses**: Select this check box if you want to include users that have external email addresses. Users that have external email accounts have user domain accounts in Active Directory, but use email accounts that are external to the organization. This enables them to be included in the global address list (GAL) and added to distribution lists.

   - **Resource mailboxes**: Select this check box if you want to include Exchange resource mailboxes. Resource mailboxes allow you to administer company resources through a mailbox, such as a conference room or a company vehicle.

   - **Contacts with external email addresses**: Select this check box if you want to include contacts that have external email addresses. Contacts that have external email addresses don't have user domain accounts in Active Directory, but the external email address is available in the GAL.

   - **Mail-enabled groups**: Select this check box if you want to include security groups or distribution groups that have been mail-enabled. Mail-enabled groups are similar to distribution groups. Email messages that are sent to a mail-enabled group account will be delivered to several recipients.

4. Click **Add a rule** to define the criteria for membership in this group.

5. Select one of the following recipient attributes from the drop-down list and provide a value. If the value for the selected attribute matches that value you define, the recipient receives a message sent to this group.

ATTRIBUTE	SEND MESSAGE TO A RECIPIENT IF...
Recipient container	The recipient object resides in the specified domain or OU.

ATTRIBUTE	SEND MESSAGE TO A RECIPIENT IF...
State or province	The specified value matches the recipient's State or province property.
Company	The specified value matches the recipient's Company property.
Department	The specified value matches the recipient's Department property.
Custom attributeN (where N is a number from 1 to 15)	The specified value matches the recipient's CustomAttributeN property.

> **IMPORTANT**
>
> The values that you enter for the selected attribute must exactly match those that appear in the recipient's properties. For example, if you enter **Washington** for **State or province**, but the value for the recipient's property is **WA**, the condition will not be met. Also, text-based values that you specify aren't case-sensitive. For example, if you specify **Contoso** for the **Company** attribute, messages will be sent to a recipient if this value is **contoso**.

6. In the **Specify words or phrases** window, type the value in the text box. Click **Add** and then click **OK**.

7. To add another rule to define the criteria for membership, click **Add a rule** under the previous rule that you created.

> **IMPORTANT**
>
> If you add multiple rules to define membership, a recipient must meet the criteria of each rule to receive a message sent to the group. In other words, each rule is connected with the Boolean operator **AND**.

8. When you've finished, click **Save** to create the dynamic distribution group.

> **NOTE**
>
> If you want to specify rules for attributes other than the ones available in the EAC, you must use the Exchange Management Shell to create a dynamic distribution group. Keep in mind that the filter and condition settings for dynamic distribution groups that have custom recipient filters can be managed only by using the Exchange Management Shell. For an example of how to create a dynamic distribution group with a custom query, see the next section on using the Exchange Management Shell to create a dynamic distribution group.

Use the Exchange Management Shell to create a dynamic distribution group

> **NOTE**
>
> If you do not specify an OU in your cmdlets, the default OU scope will be the local OU (the OU in which the dynamic distribution group is being created). With the `New-DynamicDistributionGroup` cmdlet, use the `RecipientContainer` parameter to specify an OU.

This example creates the dynamic distribution group "Mailbox Users DDG" that contains only mailbox users.

```
New-DynamicDistributionGroup -IncludedRecipients MailboxUsers -Name "Mailbox Users DDG" -RecipientContainer
Users
```

This example creates a dynamic distribution group with a custom recipient filter. The dynamic distribution group contains all mailbox users on a server called Server1.

```
New-DynamicDistributionGroup -Name "Mailbox Users on Server1" -RecipientContainer Users -RecipientFilter "
(RecipientTypeDetails -eq 'UserMailbox') -and (ServerName -eq 'Server1')"
```

This example creates a dynamic distribution group with a custom recipient filter. The dynamic distribution group contains all mailbox users that have a value of "FullTimeEmployee" in the **CustomAttribute10** property.

```
New-DynamicDistributionGroup -Name "Full Time Employees" -RecipientFilter "(RecipientTypeDetails -eq
'UserMailbox') -and (CustomAttribute10 -eq 'FullTimeEmployee')"
```

For detailed syntax and parameter information, see New-DynamicDistributionGroup.

How do you know this worked?

To verify that you've successfully created a dynamic distribution group, do one of the following:

- In the EAC, navigate to **Recipients** > **Groups**. The new dynamic distribution group is displayed in the group list. Under **Group Type**, the type is **Dynamic distribution group**.

- In the Exchange Management Shell, run the following command to display information about the new dynamic distribution group.

  ```
  Get-DynamicDistributionGroup | Format-List Name,RecipientTypeDetails,RecipientFilter,PrimarySmtpAddress
  ```

Change dynamic distribution group properties

Use the EAC to change dynamic distribution group properties

1. In the EAC, navigate to **Recipients** > **Groups**.

2. In the list of groups, click the dynamic distribution group that you want to view or change, and then click **Edit** ✏.

3. On the group's properties page, click one of the following sections to view or change properties.

   - General
   - Ownership
   - Membership
   - Delivery management
   - Message approval
   - Email options
   - MailTip
   - Group delegation

General

Use this section to view or change basic information about the group.

- *** Display name**: This name appears in the address book, on the To: line when email is sent to this group, and in the Groups list. The display name is required and should be user-friendly so people recognize what it is. It also has to be unique in your domain.

- *** Alias**: This is the portion of the email address that appears to the left of the at (@) symbol. If you change the alias, the primary SMTP address for the group will also be changed, and contain the new alias. Also, the email address with the previous alias will be kept as a proxy address for the group.

- **Description**: Use this box to describe the group so people know what the purpose of the group is. This description appears in the address book and in the Details pane in the EAC.

- **Hide this group from address lists**: Select this check box if you don't want users to see this group in the address book. To send email to this group, a sender has to type the group's alias or email address on the To: or Cc: lines.

- **Organizational unit**: This read-only box displays the organizational unit (OU) that contains the dynamic distribution group. You have to use Active Directory Users and Computers to move the group to a different OU.

Ownership

Use this section to assign a group owner. A dynamic distribution group can have only one owner. The group owner appears on the **Managed by** tab of the object in Active Directory Users and Computers.

You can add owners by clicking **Browse** and selecting the owner from the list. To remove the owner, click **Clear** (**X**) and then click **Save**.

Membership

Use this section to change the criteria used to determine membership of the group. You can delete or change existing membership rules and add new rules. For procedures that tell you how to do this, see Use the EAC to create a dynamic distribution group in the procedures for configuring membership when you use the EAC to create a new dynamic distribution group.

Delivery management

Use this section to manage who can send email to this group.

- **Only senders inside my organization**: Select this option to allow only senders in your organization to send messages to the group. This means that if someone outside your organization sends an email message to this group, it is rejected. This is the default setting.

- **Senders inside and outside of my organization**: Select this option to allow anyone to send messages to the group.

  You can further limit who can send messages to the group by allowing only specific senders to send messages to this group. Click **Add** + and then select one or more recipients. If you add senders to this list, they are the only ones who can send mail to the group. Mail sent by anyone not in the list will be rejected.

  To remove a person or a group from the list, select them in the list and then click **Remove** −.

> **IMPORTANT**
>
> If you've configured the group to allow only senders inside your organization to send messages to the group, email sent from a mail contact is rejected, even if they're added to this list.

Message approval

Use this section to set options for moderating the group. Moderators approve or reject messages sent to the group before they reach the group members.

- **Messages sent to this group have to be approved by a moderator**: This check box isn't selected by default. If you select this check box, incoming messages are reviewed by the group moderators before delivery. Group moderators can approve or reject incoming messages.

- **Group moderators**: To add group moderators, click **Add** +. To remove a moderator, select the moderator, and then click **Remove** −. If you've selected "Messages sent to this group have to be approved by a moderator" and you don't select a moderator, messages to the group are sent to the group owners for approval.
- **Senders who don't require message approval**: To add people or groups that can bypass moderation for this group, click **Add** +. To remove a person or a group, select the item, and then click **Remove** −.
- **Select moderation notifications**: Use this section to set how users are notified about message approval.
  - **Notify all senders when their messages aren't approved**: This is the default setting. Notify all senders, inside and outside your organization, when their message isn't approved.
  - **Notify senders in your organization only when their messages aren't approved**: When you select this option, only people or groups in your organization are notified when a message that they sent to the group isn't approved by a moderator.
  - **Don't notify anyone when a message isn't approved**: When you select this option, notifications aren't sent to message senders whose messages aren't approved by the group moderators.

Email options

Use this section to view or change the email addresses associated with the group. This includes the group's primary SMTP addresses and any associated proxy addresses. The primary SMTP address (also known as the *reply address*) is displayed in bold text in the address list, with the uppercase **SMTP** value in the **Type** column.

- **Add**: Click **Add** + to add a new email address for this mailbox. Select one of following address types:
  - **SMTP**: This is the default address type. Click this button and then type the new SMTP address in the *** Email address** box.

    > **NOTE**
    >
    > To make the new address the primary SMTP address for the group, select the **Make this the reply address** check box.

  - **Custom address type**: Click this button and type one of the supported non-SMTP email address types in the *** Email address** box.

    > **NOTE**
    >
    > With the exception of X.400 addresses, Exchange doesn't validate custom addresses for proper formatting. You must make sure that the custom address you specify complies with the format requirements for that address type.

- **Edit**: To change an email address associated with the group, select it from the list, and then click **Edit** ✏.

  > **NOTE**
  >
  > To make an existing address the primary SMTP address for the group, select the **Make this the reply address** check box.

- **Remove**: To delete an email address associated with the group, select it from the list, and then click

Remove −.

- **Automatically update email addresses based on the email address policy applied to this recipient**: Select this check box to have the recipient's email addresses automatically updated based on changes made to email address policies in your organization. This box is selected by default.

MailTip

Use this section to add a MailTip to alert users of potential issues before they send a message to this group. A MailTip is text that's displayed in the InfoBar when this group is added to the To, Cc, or Bcc lines of a new email message. For example, you could add a MailTip to large groups to warn potential senders that their message will be sent to lots of people.

> **NOTE**
>
> MailTips can include HTML tags, but scripts aren't allowed. The length of a custom MailTip can't exceed 175 displayed characters. HTML tags aren't counted in the limit.

Group delegation

Use this section to assign permissions to a user (called a *delegate*) to allow them to send messages as the group or send messages on behalf of the group. You can assign the following permissions:

- **Send As**: This permission allows the delegate to send messages as the group. After this permission is assigned, the delegate has the option to add the group to the **From** line to indicate that the message was sent by the group.

- **Send on Behalf Of**: This permission also allows a delegate to send messages on behalf of the group. After this permission is assigned, the delegate has the option to add the group on the **From** line. The message will appear to be sent by the group and will say that it was sent by the delegate on behalf of the group.

To assign permissions to delegates, click **Add** under the appropriate permission to display the **Select Recipient** page, which displays a list of all recipients in your Exchange organization that can be assigned the permission. Select the recipients you want, add them to the list, and then click **OK**. You can also search for a specific recipient by typing the recipient's name in the search box and then clicking **Search**.

Use the Exchange Management Shell to change dynamic distribution group properties

Use the **Get-DynamicDistributionGroup** and **Set-DynamicDistributionGroup** cmdlets to view and change properties for dynamic distribution groups. Advantages of using the Exchange Management Shell are the ability to change the properties that aren't available in the EAC and change properties for multiple groups. For information about what parameters correspond to distribution group properties, see the following topics:

- Get-DynamicDistributionGroup

- Set-DynamicDistributionGroup

Here are some examples of using the Exchange Management Shell to change dynamic distribution group properties.

This example changes the following parameters for all dynamic distribution groups in the organization:

- Hide all dynamic distribution groups from the address book

- Set the maximum message size that can be sent to the group to 5MB

- Enable moderation

- Assign the administrator as the group moderator

```
Get-DynamicDistributionGroup -ResultSize unlimited | Set-DynamicDistributionGroup -
HiddenFromAddressListsEnabled $true -MaxReceiveSize 5MB -ModerationEnabled $true -ModeratedBy administrator
```

This example adds the proxy SMTP email address, Seattle.Employees@contoso.com, to the All Employees group.

```
Set-DynamicDistributionGroup -Identity "All Employees" -EmailAddresses SMTP:All.Employees@contoso.com,
smtp:Seattle.Employees@contoso.com
```

How do you know this worked?

To verify that you've successfully changed properties for a dynamic distribution group, do the following:

- In the EAC, select the group and then click **Edit** ✏ to view the property or feature that you changed. Depending on the property that you changed, it might be displayed in the Details pane for the selected group.

- In the Exchange Management Shell, use the **Get-DynamicDistributionGroup** cmdlet to verify the changes. One advantage of using the Exchange Management Shell is that you can view multiple properties for multiple groups. In the first example, you would run the following command to verify the new values.

  ```
  Get-DynamicDistributionGroup -ResultSize unlimited | Format-List
  Name,HiddenFromAddressListsEnabled,MaxReceiveSize,ModerationEnabled,ModeratedBy
  ```

  For the example above where the message limits were changed, run this command.

  ```
  Get-Mailbox -OrganizationalUnit "Marketing" | Format-List
  Name,IssueWarningQuota,ProhibitSendQuota,ProhibitSendReceiveQuota,UseDatabaseQuotaDefaults
  ```

View members of a dynamic distribution group

8/3/2020 • 2 minutes to read • Edit Online

Dynamic distribution groups are distribution groups whose membership is based on specific recipient filters rather than a defined set of recipients. For more information, see Manage dynamic distribution groups.

You can't use the Exchange admin center (EAC) to view the members of a dynamic distribution group. You can only use the Exchange Management Shell.

What do you need to know before you begin?

- Estimated time to complete: 2 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Dynamic distribution groups" entry in the Recipients Permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the Exchange Management Shell to view the members of a dynamic distribution group

This example returns the list of members for the dynamic distribution group named Full Time Employees. The first command stores the dynamic distribution group object in the variable `$FTE`. The second command uses the **Get-Recipient** cmdlet to list the recipients that match the criteria defined for the dynamic distribution group.

```
$FTE = Get-DynamicDistributionGroup "Full Time Employees"
```

```
Get-Recipient -RecipientPreviewFilter $FTE.RecipientFilter -OrganizationalUnit $FTE.RecipientContainer
```

For detailed syntax and parameter information, see Get-DynamicDistributionGroup and Get-Recipient.

Manage mail contacts

8/3/2020 • 9 minutes to read • Edit Online

Mail contacts are essentially contacts for people outside your Exchange or organization. Each mail contact has an external email address. For more information about mail contacts, see Recipients.

What do you need to know before you begin?

- Estimated time to complete: 2 minutes.
- To open the EAC, see Exchange admin center in Exchange Server. To open the Exchange Management Shell, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Create a mail contact

Use the EAC to create a mail contact

1. In the EAC, navigate to **Recipients** > **Contacts**.
2. Click **New** ＋ > **Mail contact**.
3. Complete the following boxes on the **New mail contact** page:
   - **First name**: Use this box to type the contact's first name.
   - **Initials**: Use this box to type the contact's initials.
   - **Last name**: Use this box to type the contact's last name.
   - *** Display name**: Use this box to type a display name for the contact. This is the name that's listed in the contacts list in the EAC and in your organization's address book. By default, this box is populated with the names you enter in the **First name**, **Initials**, and **Last name** boxes. If you didn't use those boxes, you must still type a name in this box because it's required. The name can't exceed 64 characters.
   - *** Name**: Use this box to type a name for the contact. This is the name that's listed in the directory service. Like the display name, this box is populated by default with the names you enter in the **First name**, **Initials**, and **Last name** boxes. If you didn't use those boxes, you must still type a name in this box because it's required. The name can't exceed 64 characters.
   - *** Alias**: Use this box to type an alias (64 characters or less) for the contact. This box is required.

   - *** External email address**: Use this box to type the outside email account of the contact. This box is required. Email sent to this contact is forwarded to this email address.

   - **Organizational unit**: You can select an organizational unit (OU) other than the default, which is the recipient scope. If the recipient scope is set to the forest, the default value is set to the Users container in the domain that contains the computer on which the EAC is running. If the recipient scope is set to a specific domain, the Users container in that domain is selected by default. If the recipient scope is set to a specific OU, that OU is selected by default.

     To select a different OU, click **Browse**. The dialog box displays all OUs in the forest that are within the specified scope. Select the OU you want, and then click **OK**.

4. When you've finished, click **Save**.

Use the Exchange Management Shell to create a mail contact

This example creates a mail contact for Debra Garcia in Exchange Server 2016.

```
New-MailContact -Name "Debra Garcia" -ExternalEmailAddress dgarcia@tailspintoys.com -OrganizationalUnit Users
```

This example mail-enables an existing contact named Karen Toh in Exchange Server 2016.

```
Enable-MailContact -Identity "Karen Toh" -ExternalEmailAddress ktoh@tailspintoys.com
```

How do you know this worked?

To verify that you've successfully created a mail contact, do one of the following:

- In the EAC, navigate to **Recipients** > **Contacts**. The new mail contact is displayed in the contact list. Under **Contact Type**, the type is **Mail contact**.

- In the Exchange Management Shell, run the following command to display information about the new mail contact.

  ```
  Get-MailContact <Name> | Format-List Name,RecipientTypeDetails,ExternalEmailAddress
  ```

Change mail contact properties

Use the EAC to change mail contact properties

1. In the EAC, navigate to **Recipients** > **Contacts**.

2. In the list of mail contacts and mail users, click the mail contact that you want to change the properties for, and then click **Edit** ✎.

3. On the mail contact properties page, click one of the following sections to view or change properties.

   - General

   - Contact Information

   - Organization

   - Email Options

   - MailTip

General

Use the **General** section to view or change basic information about the mail contact.

- **First name**, **Initials**, **Last name**
- * **Name**: This is the name that's listed in Active Directory. If you change this name, it can't exceed 64 characters.
- * **Display name**: This name appears in your organization's address book, on the To and From lines in email, and in the Mailbox list. This name can't contain empty spaces before or after the display name.
- * **Alias**: This is the mail contact's alias. If you change it, it must be unique in the organization and must be 64 characters or less.
- * **External email address**: This is mail contact's primary SMTP address and their outside email account. Email sent to this contact is forwarded to this email address.
- Click **More options** to display the OU that contains the mail contact account. You have to use Active Directory Users and Computers to move the contact to a different OU.

Contact Information

Use the **Contact Information** section to view or change the recipient's contact information, such as mailing address and telephone numbers. This information is displayed in the address book.

Organization

Use the **Organization** section to record detailed information about the mail contact's role in the organization. This information is displayed in the address book. Also, you can create a virtual organization chart that's accessible from email clients such as Outlook.

- **Title**: Use this box to view or change the contact's title.
- **Department**: Use this box to view or change the department in which the contact works. You can use this box to create recipient conditions for dynamic distribution groups and address lists.
- **Company**: Use this box to view or change the company for which the contact works. You can also use this box to create recipient conditions for dynamic distribution groups.
- **Manager**: To add a manager, click **Browse**. In **Select Manager**, select a person, and then click **OK**.
- **Direct reports**: You can't modify this box. A *direct report* is a recipient who reports to a specific manager. If you've specified a manager for the recipient, that recipient appears as a direct report in the details of the manager's mailbox. For example, Toby manages Ann and Spencer, who are mail contacts, so Toby is specified in the **Manager** box in the organization properties for Ann and Spencer, and Ann and Spencer appear in the **Direct reports** box in the properties of Toby's mailbox.

Email Options

Use the **Email Options** section to add or remove proxy addresses for the mail contact or edit existing proxy addresses. The mail contact's primary SMTP address is also displayed in this section, but you can't change it. To change it, you have to change the contact's external email address in the **General** section.

MailTip

Use the **MailTip** section to add a MailTip to alert users of potential issues before they send a message to this recipient. A MailTip is text that's displayed in the InfoBar when this recipient is added to the To, Cc, or Bcc lines of a new email message.

> **NOTE**
>
> MailTips can include HTML tags, but scripts aren't allowed. The length of a custom MailTip can't exceed 175 displayed characters. HTML tags aren't counted in the limit.

Use the Exchange Management Shell to change mail contact properties

Properties for a mail contact are stored in both Active Directory and Exchange. In general, use the **Get-Contact** and **Set-Contact** cmdlets to view and change organization and contact information properties. Use the **Get-MailContact** and **Set-MailContact** cmdlets to view or change mail-related properties, such as email addresses, the MailTip, custom attributes, and whether the contact is hidden from address lists.

For more information, see the following topics:

- Get-Contact
- Set-Contact
- Get-MailContact
- Set-MailContact

Here are some examples of using the Exchange Management Shell to change mail contact properties.

This example configures the Title, Department, Company, and Manager properties for the mail contact Kai Axford.

```
Set-Contact "Kai Axford" -Title Consultant -Department "Public Relations" -Company Fabrikam -Manager "Karen Toh"
```

This example sets the CustomAttribute1 property to a value of PartTime for all mail contacts and hides them from the organization's address book.

```
Get-MailContact | Set-MailContact -CustomAttribute1 PartTime -HiddenFromAddressListsEnabled $true
```

This example sets the CustomAttribute15 property to a value of TemporaryEmployee for all mail contacts in the Public Relations department.

```
Get-Contact -Filter "Department -eq 'Public Relations'" | Set-MailContact -CustomAttribute15 TemporaryEmployee
```

How do you know this worked?

To verify that you've successfully changed properties for a mail contact, do the following:

- In the EAC, select the mail contact, and then click **Edit** ✎ to view the property that you changed.
- In the Exchange Management Shell, use the **Get-Contact** and **Get-MailContact** cmdlets to verify the changes. One advantage of using the Exchange Management Shell is that you can view multiple properties for multiple mail contacts. In the example above where all mail contacts had the CustomAttribute1 property set to PartTime and were hidden from the address book, run the following command to verify the changes.

  ```
  Get-MailContact | Format-List Name,CustomAttribute1,HiddenFromAddressListsEnabled
  ```

  In the example above where the CustomAttribute15 was set for all mail contacts in the Public Relations department, run the following command to verify the changes.

  ```
  Get-Contact -Filter "Department -eq 'Public Relations'" | Get-MailContact | Format-List Name,CustomAttribute15
  ```

Bulk edit mail contacts

You can use the EAC to change selected properties for multiple mail contacts. When you select two or more mail contacts from the contacts list in the EAC, the properties that can be bulk edited are displayed in the Details pane.

When you change one of these properties, the change is applied to all selected recipients.

When you bulk edit mail contacts, you can change the following property areas:

- **Contact Information**: Change shared properties such as street, postal code, and city name.
- **Organization**: Change shared properties such as department name, company name, and the manager that the selected mail contacts or mail users report to.

Use the EAC to bulk edit mail contacts

1. In the EAC, navigate to **Recipients** > **Contacts**.
2. In the list of contacts, select two or more mail contacts. You can't bulk edit a combination of mail contacts and mail users.

   > **TIP**
   >
   > You can select multiple adjacent mail contacts by holding down the Shift key and clicking the first mail contact, and then clicking the last mail contact you want to edit. You can also select multiple mail contacts by holding down the Ctrl key and clicking each one that you want to edit.

3. In the Details pane, under **Bulk Edit**, click **Update** under **Contact Information** or **Organization**.
4. Make the changes on the properties page and then save your changes.

How do you know this worked?

To verify that you've successfully bulk edited mail contacts, do one of the following:

- In the EAC, select each of the mail contacts that you bulk edited, and then click **Edit** ✎ to view the properties that you changed.
- In the Exchange Management Shell, use the **Get-Contact** cmdlet to verify the changes. For example, say you used the bulk edit feature in the EAC to change the manager and the office for all mail contacts from a vendor company named A. Datum Corporation. To verify these changes, you could run the following command in the Exchange Management Shell.

  ```
  Get-Contact -ResultSize unlimited -Filter "Company -eq 'Adatum'" | Format-List Name,Office,Manager
  ```

Manage mail users

8/3/2020 • 16 minutes to read • Edit Online

Mail users are similar to mail contacts. Both have external email addresses and both contain information about people outside your Exchange organization that can be displayed in the shared address book and other address lists. However, unlike a mail contact, a mail user has logon credentials in your Exchange organization and can access resources. For more information, see Recipients.

What do you need to know before you begin?

- Estimated time to complete: 2 minutes.
- To open the EAC, see Exchange admin center in Exchange Server. To open the Exchange Management Shell, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Create a mail user

Use the EAC to create a mail user

1. In the EAC, navigate to **Recipients** > **Contacts** > **New** > **Mail user**.
2. On the **New mail user** page, in the * **Alias** box, type the alias for the mail user. The alias can't exceed 64 characters and must be unique in the forest. This is required.
3. Do one of the following to specify the email address type for the mail user:
   - To specify an SMTP email address for the mail user's external email address, click **SMTP**.

   > **NOTE**
   >
   > Exchange validates SMTP addresses for correct formatting. If your entry is inconsistent with the SMTP format, an error message will be displayed when you click **Save** to create the mail user.

   - To specify a custom address type, click the option button and then type the custom address type. For example, you can specify an X.500, GroupWise, or Lotus Notes address.
4. In the * **External email address** box, type the mail user's external email address. Email sent to this mail user is forwarded to this email address. This is required.
5. Select one of the following options:
   - **Existing user**: Select to mail-enable an existing user.

  Click **Browse** to open the **Select User - Entire Forest** dialog box. This dialog box displays a list of user accounts in the organization that aren't mail-enabled or don't have mailboxes. Select the user account you want to mail-enable, and then click **OK**. If you select this option, you don't have to provide user account information because this information already exists in Active Directory.

- **New user**: Select to create a new user account in Active Directory and mail-enable the user. If you select this option, you'll have to provide the required user account information.

6. If you selected **New User** in Step 5, complete the following information on the **New mail user** page. Otherwise skip to Step 7.

   - **First name**: Type the first name of the mail user.

   - **Initials**: Type the initials of the mail user.

   - **Last name**: Type the last name of the mail user.

   - *** Display name**: Use this box to type a display name for the user. This is the name that's listed in the contacts list in the EAC and in your organization's address book. By default, this box is populated with the names you enter in the **First name**, **Initials**, and **Last name** boxes. If you didn't use those boxes, you must still type a name in this box because it's required. The name can't exceed 64 characters.

   - *** Name**: Use this box to type a name for the mail user. This is the name that's listed in the directory service. This box is also populated with the names you enter in the **First name**, **Initials**, and **Last name** boxes. If you didn't use those boxes, you must still type a name because this is required. This name also can't exceed 64 characters.

   - **Organizational unit**: You can select an organizational unit (OU) other than the default (which is the recipient scope). If the recipient scope is set to the forest, the default value is set to the Users container in the domain that contains the computer on which the EAC is running. If the recipient scope is set to a specific domain, the Users container in that domain is selected by default. If the recipient scope is set to a specific OU, that OU is selected by default.

     To select a different OU, click **Browse**. The dialog box displays all OUs in the forest that are within the specified scope. Select the OU you want, and then click **OK**.

   - *** User logon name**: Type the name that the mail user will use to log on to the domain. The user logon name consists of a username on the left side of the at (@) symbol and a suffix on the right side. Typically, the suffix is the domain name the user account resides in.

   - *** New Password**: Type the password that the mail user must use to log on to the domain. Make sure that the password you supply complies with the password length, complexity, and history requirements of the domain you're creating the user account in.

   - *** Confirm password**: Use this box to confirm the password that you typed in the **Password** box.

   - **Require password change on next logon**: Select this check box if you want mail users to reset the password when they first log on to the domain.

     If you select this check box, at first logon, the new mail user will be prompted with a dialog box in which to change the password. The mail user won't be allowed to perform any tasks until the password is changed successfully.

7. When you've finished, click **Save** to create the mail user.

Use the Exchange Management Shell to create a mail user

This example creates a mail-enabled user account for Jeffrey Zeng in Exchange Server 2016 with the following details:

- The name and display name is Jeffrey Zeng.
- The alias is jeffreyz.
- The external email address is jzeng@tailspintoys.com.
- The first name is Jeffrey and the last name is Zeng.
- The logon name is jeffreyz@contoso.com.
- The password is Pa$$word1.
- The mail user will be created in the default OU. To specify a different OU, you can use the *OrganizationalUnit* parameter.

```
New-MailUser -Name "Jeffrey Zeng" -Alias jeffreyz -ExternalEmailAddress jzeng@tailspintoys.com -FirstName
Jeffrey -LastName Zeng -UserPrincipalName jeffreyz@contoso.com -Password (ConvertTo-SecureString -String
'Pa$$word1' -AsPlainText -Force)
```

For detailed syntax and parameter information, see New-MailUser.

How do you know this worked?

To verify that you've successfully created a mail user, do one of the following:

- In the EAC, navigate to **Recipients** > **Contacts**. The new mail user is displayed in the list of contacts. Under **Contact Type**, the type is **Mail user**.
- In the Exchange Management Shell, run the following command to display information about the new mail user.

  ```
  Get-MailUser <Name> | Format-List Name,RecipientTypeDetails,ExternalEmailAddress
  ```

Change mail user properties

After you create a mail user, you can make changes and set additional properties by using the EAC or the Exchange Management Shell.

You can also change properties for multiple user mailboxes at the same time. For more information, see Use the EAC to bulk edit mail users.

The estimated time to complete this task will vary based on the number of properties you want to view or change.

Use the EAC to change user mailbox properties

1. In the EAC, navigate to **Recipients** > **Contacts**.
2. In the list of contacts, click the mail user that you want to change the properties for, and then click **Edit** ✎.
3. On the mail user properties page, click one of the following sections to view or change properties.
   - General
   - Contact Information
   - Organization
   - Email Addresses
   - Mail Flow Settings

  - Member Of

  - MailTip

General

Use the **General** section to view or change basic information about the mail user.

- **First name**, **Initials**, **Last name**

- * **Name**: This is the name that's listed in Active Directory. If you change this name, it can't exceed 64 characters.

- * **Display name**: This name appears in your organization's address book, on the To: and From: lines in email, and in the list of contacts in the EAC. This name can't contain empty spaces before or after the display name.

- * **User logon name**: This is the name that the user uses to log on to the domain.

- **Hide from address lists**: Select this check box to prevent the mail user from appearing in the address book and other address lists that are defined in your Exchange organization. After you select this check box, users can still send messages to the recipient by using the email address.

- **Require password change on next logon**: Select this check box if you want the user to reset their password the next time they log on to the domain.

Click **More options** to view or change these additional properties:

- **Organizational unit**: This read-only box displays the organizational unit (OU) that contains the mail user account. You have to use Active Directory Users and Computers to move the account to a different OU.

- **Custom attributes**: This section displays the custom attributes defined for the mail user. To specify custom attribute values, click **Edit** ✎. You can specify up to 15 custom attributes for the recipient.

Contact Information

Use the **Contact Information** section to view or change the user's contact information. The information on this page is displayed in the address book. Click **More options** to display additional boxes.

> **TIP**
>
> You can use the **State/Province** box to create recipient conditions for dynamic distribution groups, email address policies, or address lists.

Organization

Use the **Organization** section to record detailed information about the user's role in the organization. This information is displayed in the address book. Also, you can create a virtual organization chart that's accessible from email clients such as Outlook.

- **Title**: Use this box to view or change the recipient's title.

- **Department**: Use this box to view or change the department in which the user works. You can use this box to create recipient conditions for dynamic distribution groups, email address policies, or address lists.

- **Company**: Use this box to view or change the company for which the user works. You can use this box to create recipient conditions for dynamic distribution groups, email address policies, or address lists.

- **Manager**: To add a manager, click **Browse**. In **Select Manager**, select a person, and then click **OK**.

- **Direct reports**: You can't modify this box. A *direct report* is a user who reports to a specific manager. If you've specified a manager for the user, that user appears as a direct report in the details of the manager's mailbox. For example, Kari manages Chris and Kate, so Kari is specified in the **Manager** box for Chris and Kate, and Chris and Kate appear in the **Direct reports** box in the properties of Kari's account.

Email Addresses

Use the **Email Addresses** section to view or change the email addresses associated with the mail user. This includes the mail user's primary SMTP address, their external email address, and any associated proxy addresses. The primary SMTP address (also known as the *default reply address*) is displayed in bold text in the address list, with the uppercase **SMTP** value in the **Type** column. By default, after the mail user is created, the primary SMTP address and the external email address are the same.

- **Add**: Click **Add** ＋ to add a new email address for this mailbox. Select one of following address types:
  - **SMTP**: This is the default address type. Click this button and then type the new SMTP address in the *** Email address** box.
  - **Custom address type**: Click this button and type one of the supported non-SMTP email address types in the *** Email address** box.

    Note: With the exception of X.400 addresses, Exchange doesn't validate custom addresses for correct formatting. You must make sure that the custom address you specify complies with the format requirements for that address type.
- **Set the external email address**: Use this box to change the mail user's external address. Email sent to this mail user is forwarded to this email address.
- **Automatically update email addresses based on the email address policy applied to this recipient**: Select this check box to have the recipient's email addresses automatically updated based on changes made to email address policies in your organization. This box is selected by default.

Mail Flow Settings

Use the **Mail Flow Settings** section to view or change the following settings:

- **Message Size Restrictions**: These settings control the size of messages that the mail user can send and receive. Click **View details** to view and change maximum size for sent and received messages.
  - **Sent messages**: To specify a maximum size for messages sent by this user, select the **Maximum message size (KB)** check box and type a value in the box. The message size must be between 0 and 2,097,151 KB. If the user sends a message larger than the specified size, the message will be returned to the user with a descriptive error message.
  - **Received messages**: To specify a maximum size for messages received by this user, select the **Maximum message size (KB)** check box and type a value in the box. The message size must be between 0 and 2,097,151 KB. If the user receives a message larger than the specified size, the message will be returned to the sender with a descriptive error message.
- **Message Delivery Restrictions**: These settings control who can send email messages to this mail user. Click **View details** to view and change these restrictions.
  - **Accept messages from**: Use this section to specify who can send messages to this user.
  - **All senders**: Select this option to specify that the user can accept messages from all senders. This includes both senders in your Exchange organization and external senders. This option is selected by default. This option includes external users only if you clear the **Require that all senders are authenticated** check box. If you select this check box, messages from external users will be rejected.
  - **Only senders in the following list**: Select this option to specify that the user can accept messages only from a specified set of senders in your Exchange organization. Click **Add** ＋ to display the **Select Recipients** page, which displays a list of all recipients in your Exchange organization. Select the recipients you want, add them to the list, and then click **OK**. You can also search for a specific

recipient by typing the recipient's name in the search box and then clicking **Search** 🔎.

  - **Require that all senders are authenticated**: Select this option to prevent anonymous users from sending messages to the user.

  - **Reject messages from**: Use this section to block people from sending messages to this user.

  - **No senders**: Select this option to specify that the mailbox won't reject messages from any senders in the Exchange organization. This option is selected by default.

  - **Senders in the following list**: Select this option to specify that the mailbox will reject messages from a specified set of senders in your Exchange organization. Click **Add** + to display the **Select Recipients** page, which displays a list of all recipients in your Exchange organization. Select the recipients you want, add them to the list, and then click **OK**. You can also search for a specific recipient by typing the recipient's name in the search box and then clicking **Search** 🔎.

Member Of

Use the **Member Of** section to view a list of the distribution groups or security groups to which this user belongs. You can't change membership information on this page. Note that the user may match the criteria for one or more dynamic distribution groups in your organization. However, dynamic distribution groups aren't displayed on this page because their membership is calculated each time they're used.

MailTip

Use the **MailTip** section to add a MailTip to alert users of potential issues before they send a message to this recipient. A MailTip is text that's displayed in the InfoBar when this recipient is added to the To, Cc, or Bcc lines of a new email message.

> **NOTE**
>
> MailTips can include HTML tags, but scripts aren't allowed. The length of a custom MailTip can't exceed 175 displayed characters. HTML tags aren't counted in the limit.

Use the Exchange Management Shell to change mail user properties

Properties for a mail user are stored in both Active Directory and Exchange. In general, use the **Get-User** and **Set-User** cmdlets to view and change organization and contact information properties. Use the **Get-MailUser** and **Set-MailUser** cmdlets to view or change mail-related properties, such email addresses, the MailTip, custom attributes, and whether the mail user is hidden from address lists.

Use the **Get-MailUser** and **Set-MailUser** cmdlets to view and change properties for mail users. For information, see the following topics:

- Get-User

- Set-User

- Get-MailUser

- Set-MailUser

Here are some examples of using the Exchange Management Shell to change mail user properties.

This example sets the external email address for Pilar Pinilla.

```
Set-MailUser "Pilar Pinilla" -ExternalEmailAddress pilarp@tailspintoys.com
```

This example hides all mail users from the organization's address book.

```
Get-MailUser | Set-MailUser -HiddenFromAddressListsEnabled $true
```

This example sets the Company property for all mail users to Contoso.

```
Get-User -ResultSize unlimited -Filter "RecipientTypeDetails -eq 'mailuser'" | Set-User -Company Contoso
```

This example sets the CustomAttribute1 property to a value of ContosoEmployee for all mail users that have a value of Contoso in the Company property.

```
Get-User -ResultSize unlimited -Filter "(RecipientTypeDetails -eq 'mailuser') -and (Company -eq 'Contoso')" |
Set-MailUser -CustomAttribute1 ContosoEmployee
```

For detailed syntax and parameter information, see Set-MailUser.

How do you know this worked?

To verify that you've successfully changed properties for mail users, do the following:

- In the EAC, select the mail user and then click **Edit** ✎ to view the property that you changed.

- In the Exchange Management Shell, use the **Get-User** and **Get-MailUser** cmdlets to verify the changes. One advantage of using the Exchange Management Shell is that you can view multiple properties for multiple mail contacts.

  ```
  Get-MailUser | Format-List Name,CustomAttribute1
  ```

  In the example above where the Company property was set to Contoso for all mail contacts, run the following command to verify the changes:

  ```
  Get-User -ResultSize unlimited -Filter "RecipientTypeDetails -eq 'mailuser'" | Format-List Name,Company
  ```

  In the example above where all mail users had the CustomAttribute1 property set to ContosoEmployee, run the following command to verify the changes.

  ```
  Get-MailUser | Format-List Name,CustomAttribute1
  ```

Bulk edit mail users

You can also use the EAC to change selected properties for multiple mail users. When you select two or more mail users from the contacts list in the EAC, the properties that can be bulk edited are displayed in the Details pane. When you change one of these properties, the change is applied to all selected recipients.

When you bulk edit mail users, you can change the following property areas:

- **Contact Information**: Change shared properties such as street, postal code, and city name.

- **Organization**: Change shared properties such as department name, company name, and the manager that the selected mail contacts or mail users report to.

Use the EAC to bulk edit mail users

1. In the EAC, navigate to **Recipients** > **Contacts**.

2. In the list of contacts, select two or more mail users. You can't bulk edit a combination of mail contacts and

mail users.

Note: You can select multiple adjacent mail users by holding down the Shift key and clicking the first mail user, and then clicking the last mail user you want to edit. You can also select multiple mail users by holding down the Ctrl key and clicking each one that you want to edit.

3. In the Details pane, under **Bulk Edit**, click **Update** under **Contact Information** or **Organization**.

4. Make the changes on the properties page and then save your changes.

How do you know this worked?

To verify that you've successfully bulk edited mail users, do one of the following:

- In the EAC, select each of the mail users that you bulk edited and then click **Edit** ✏ to view the properties that you changed.

- In the Exchange Management Shell, use the **Get-User** cmdlet to verify the changes. For example, say you used the bulk edit feature in the EAC to change the manager and the office for all mail users from a vendor company named A. Datum Corporation. To verify these changes, you could run the following command in the Exchange Management Shell:

```
Get-User -ResultSize unlimited -Filter "(RecipientTypeDetails -eq 'mailuser') -and (Company -eq
'Adatum')" | Format-List Name,Office,Manager
```

Create and manage room mailboxes

8/3/2020 • 18 minutes to read • Edit Online

A room mailbox is a resource mailbox that's assigned to a physical location, such as a conference room, an auditorium, or a training room. With room mailboxes, users can easily reserve these rooms by including room mailboxes in their meeting requests. When they do this, the room mailbox uses options you can configure to decide whether the invite should be accepted or denied.

To create a room mailbox, you need to be an administrator who's a member of either the Organization Management or Recipient Management role groups.

If you want to grant someone access to a room mailbox so they can directly manage its calendar (for example, an assistant who needs to make room for an executive meeting), you can do so using the instructions in Manage permissions for recipients. After a user's been granted permissions to access a room mailbox, they can open the mailbox using the instructions in Open and use a shared mailbox in Outlook for Windows.

IMPORTANT Room mailboxes should never be set as the organizer of a meeting, nor should room mailboxes be accessed directly by users in order to make changes to a meeting. Rooms should only be added to meetings in the Attendee or Location fields. Otherwise you will override the Resource Booking Assistant (RBA), which manages and processes all calendar items sent to the room mailbox, and unexpected errors may occur. If your organization has one or more users who need to manage a room and its mailbox, then assign users to the room as resource delegates for the room mailbox, as described later in this article. When a delegate is assigned, all items sent to the room's mailbox will be directed to the booking delegate, who can then accept or decline from their own Inbox. If your organization wants to use a room mailbox like a team calendar, consider using Exchange's shared calendar features.

If you want to learn about the types of recipients that are available in Exchange Server, check out Recipients. For info about another type of resource mailbox, check out Manage equipment mailboxes.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- To open the Exchange admin center (EAC), see Exchange admin center in Exchange Server. To open the Exchange Management Shell, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the"Recipient Provisioning Permissions" section in the Recipients Permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.
- If you're using room or equipment mailboxes in Microsoft 365 or Office 365, see [Room and equipment mailboxes(https://docs.microsoft.com/microsoft-365/admin/manage/room-and-equipment-mailboxes) for more information.

IMPORTANT

If you're running Exchange 2013 in a hybrid scenario, make sure you create the room mailboxes in the appropriate place. Create your room mailboxes for your on-premises organization on-premises, and room mailboxes for Exchange Online should be created in the cloud. > Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Create a room mailbox

1. In the Exchange admin center, navigate to **Recipients** > **Resources**.

2. To create a room mailbox, click **New** + > **Room mailbox**.

3. Use the options on the page to specify the settings for the new resource mailbox.

   - **Room name**: Use this box to type a name for the room mailbox. This is the name that's listed in the resource mailbox list in the Exchange admin center and in your organization's address book. This name is required and it can't exceed 64 characters.

     TIP

     Although there are other fields that describe the details of the room (for example, Location and Capacity) consider summarizing the most important details in the room name using a consistent naming convention. Why? So users can easily see the details when they select the room from the address book in the meeting request.

   - **Alias**: A room mailbox has an email address so it can receive booking requests. The email address consists of an alias on the left side of the @ symbol, which must be unique in the forest, and your domain name on the right. The alias is required.

   - **Location**, **Phone**, **Capacity**: You can use these fields to enter details about the room. However, as explained earlier, you can include some or all of this information in the room name so users can see it.

4. When you're finished, click **Save** to create the room mailbox.

After you've created a room mailbox, you can Change how a room mailbox handles meeting requests (including whether it responds automatically or someone needs to decide what to do). By default, it'll automatically accept or decline requests depending on whether the requests conflict with any existing meetings on its calendar. It'll also allow meetings that repeat, and allow meetings up to 180 days from the current date (and decline any requests beyond that) that are up to 24 hours in duration. If you want to change other options, head down to Change other room mailbox properties.

For information on how to create a room mailbox using the Exchange Management shell, see Examples 2 and 3 in New-Mailbox.

Change how a room mailbox handles meeting requests

1. In the Exchange admin center, navigate to **Recipients** > **Resources**.

2. In the list of resource mailboxes, click the room mailbox that you want to change the properties for, and then click **Edit** ✎.

3. On the room mailbox properties page, click **Booking Delegates** (allow automatic responses or not) or **Booking Options** (allow repeating meetings, decline meetings that are scheduled too far out, etc).

Use the **Booking Delegates** section to view or change how the room mailbox handles meeting requests and to define who can accept or decline booking requests if it isn't done automatically.

- Select one of the following options to handle meeting requests.
  - **Accept or decline booking requests automatically**: If this is selected, the meeting request will automatically be declined if there's a scheduling conflict with an existing reservation, or if the booking request violates the scheduling limits of the resource, for example, the reservation duration is too long.
  - **Select delegates who can accept or decline booking requests**: If this is selected, one of the people you added to the **Delegates** list below will be responsible for accepting or declining meeting requests that are sent to the room mailbox. If you assign more than one resource delegate, only one of them has to act on a specific meeting request.

Use the **Booking Options** section to view or change the settings for the booking policy that defines when the room can be scheduled, how long it can be reserved, and how far in advance it can be reserved.

- **Allow repeating meetings**: This setting allows or prevents repeating meetings for the room.
- **Allow scheduling only during working hours**: This setting accepts or declines meeting requests that aren't during the working hours defined for the room, which are, by default, 8:00 A.M. to 5:00 P.M. Monday through Friday. You can configure the working hours of the room mailbox either by logging into the mailbox using Outlook on the web and going to the **Options** > **Calendar** > **Calendar appearance** page, or by using Set-MailboxCalendarConfiguration.
- **Always decline if the end date is beyond this limit**: This setting controls the behavior of repeating meetings that extend beyond the date specified by the maximum booking lead time setting.
  - If you enable this setting, a repeating booking request is automatically declined if the bookings start on or before the date specified by the value in the **Maximum booking lead time** box, and they extend beyond the specified date. This is the default setting.
  - If you disable this setting, a repeating booking request is automatically accepted if booking requests start on or before the date specified by the value in the **Maximum booking lead time** box, and they extend beyond the specified date. However, the number of bookings is reduced so bookings won't occur after the specified date.
- **Maximum booking lead time (days)**: This setting specifies the maximum number of days in advance that the room can be booked. Valid input is an integer between 0 and 1080. The default value is 180 days.
- **Maximum duration (hours)**: This setting specifies the maximum duration that the room can be reserved in a booking request. A valid value is an integer from 0 through 35791394. The default value is 24 hours. When the value is set to 0, the maximum duration of a meeting is unlimited.

  For repeating booking requests, the maximum booking duration applies to the length of each instance of the repeating booking request.

There's also a box on this page that you can use to write a message that will be sent to users who send booking requests to reserve the room.

Change resource scheduling settings

An Admin or user with full access to the resource mailbox can make changes to the resource scheduling settings.

1. Log in to Outlook Web App and click on **Your name** in the top right corner.
2. Click **Open another mailbox**. Locate the meeting room resource you want and click **Open**.
3. Go to **settings** and click **Calendar**.

4. Navigate to **Resource scheduling**.
5. Configure the Scheduling Options and Scheduling Permissions as needed. (See the descriptions of all options in the following two sections for details.)
6. Click **Save** after you have finished making your changes.

Scheduling Options

- **Automatically process meeting requests and cancellations**

Enables or disables all options below as well as the options under Scheduling Permissions. If not checked, the owner must manage every request manually. By default, this is not checked.

- **Disable reminders**

Enables or disables reminders for events in this calendar. This setting applies only to the resource; the organizer and attendees will still receive reminders if they have elected to do so.

- **Maximum number of days in advance resources can be booked**

Limits how far in advance an event can be scheduled. The default is 180 days.

- **Always decline if the end date is beyond this limit**

Requests beyond the maximum number of days specified will be automatically declined. Valid values are between 0 (today) and 1080 (about three years in the future).

- **Limit meeting duration and Maximum allowed minutes**

Limits the amount of time for which a room can be scheduled within a single day. Unchecking the box will mean a meeting has no limit. Checking the box allows for a limit between 0 to 1440 minutes.

- **Allow scheduling only during working hours**

If checked, an event can only be scheduled during the hours specified under Calendar Work Week in the Calendar tab. Events outside of working hours will be automatically declined.

- **Allow repeating meetings**

Allows booking of the resource room at a regular interval. The event can be set to repeat over a specified duration of time (also called recurring).

- **Allow conflicts**

Allow or prevent conflicting meeting requests (double booking). If repeating meetings are allowed as well, this setting will only apply to repeating meetings. When the resource is invited, it will need to be entered into the Attendees field as opposed to being chosen with the Add Rooms button.

- **Allow up to this number of individual conflicts**

This setting specifies the maximum number of conflicts that are allowed for new repeating meeting requests. When set to 0, a recurring event will fail to schedule if one or more conflicting appointments already appear. When set to a number greater than 0, a recurring event is allowed the specified number of conflicts before being denied.

- **Allow up to this percentage of individual conflicts**

This setting specifies the maximum percentage of meeting conflicts that are allowed for new repeating meeting requests. This is similar to specifying a number of individual conflicts (explained above), but in this case, a recurring event is allowed the specified percentage of conflicts before being denied.

Scheduling Permissions

- **These users can schedule automatically if the resource is available**

By default, everyone can schedule this resource without the manual approval of the resource owner. If **Select users and groups** is selected, only the users and groups specified can schedule automatically. All other users or groups will receive a decline message. If **Select users and groups** is selected but no users or groups are specified, this option will be ignored.

- **These users can submit a request for owner approval if the resource is available**

If everyone is selected, then all requests must receive manual approval by the resource owner. If **Select users and groups** is selected, only the specified users and groups require manual approval by the resource owner. **Select users and groups** is selected and left blank by default so that all requests are approved automatically.

- **These users can schedule automatically if the resource is available and can submit a request for owner approval if the resource is unavailable**

When everyone is selected (the default setting), any request during an open time frame will be automatically approved. If the room is booked at the requested time, a form is submitted to the resource owner for manual approval. If **Select users and groups** is selected, only those specified will have the option to have the request manually approved; all others will have a conflicting request denied without the option of manual approval by the resource owner.

Change other room mailbox properties

After you create a room mailbox, you can make changes and set additional properties by using the Exchange admin center or the Exchange Management Shell.

Use the Exchange admin center to change room mailbox properties

1. In the Exchange admin center, navigate to **Recipients** > **Resources**.

2. In the list of resource mailboxes, click the room mailbox that you want to change the properties for, and then click **Edit** ✎.

3. On the room mailbox properties page, click one of the following sections to view or change properties (for booking options, see Change how a room mailbox handles meeting requests.

   - General

   - Contact Information

   - Email Address

   - MailTip

General

Use the **General** section to view or change basic information about the resource.

- **Room name**: This name appears in the resource mailbox list in the Exchange admin center and in your organization's address book. It can't exceed 64 characters if you change it.

- **Email address**: This read-only box displays the email address for the room mailbox. You can change it in the Email Address section.

- **Capacity**: Use this box to enter the maximum number of people who can safely occupy the room.

Click **More options** to view or change these additional properties:

- **Organizational unit**: This read-only box displays the organizational unit (OU) that contains the account for the room mailbox. You have to use Active Directory Users and Computers to move the account to a different OU.

- **Mailbox database**: This read-only box displays the name of the mailbox database that hosts the room mailbox. Use the **Migration** page in the Exchange admin center to move the mailbox to a different database.
- **Alias** Use this box to change the alias for the room mailbox.
- **Hide from address lists**: Select this check box to prevent the room mailbox from appearing in the address book and other address lists that are defined in your Exchange organization. After you select this check box, users can still send booking messages to the room mailbox by using the email address.
- **Department**: Use this box to specify a department name that the room is associated with. You can use this property to create recipient conditions for dynamic distribution groups and address lists.
- **Company**: Use this box to specify a company that the room is associated with, if applicable. Like the Department property, you can use this property to create recipient conditions for dynamic distribution groups and address lists.
- **Address book policy**: Use this option to specify an address book policy (ABP) for the room mailbox. ABPs contain a global address list (GAL), an offline address book (OAB), a room list, and a set of address lists. To learn more, see Address book policies in Exchange Server.

  In the drop-down list, select the policy that you want associated with this mailbox.
- **Custom attributes**: This section displays the custom attributes defined for the room mailbox. To specify custom attribute values, click **Edit** ✎. You can specify up to 15 custom attributes for the recipient.

Contact Information

Use the **Contact Information** section to view or change the contact information for the room. The information on this page is displayed in the address book.

> **TIP**
>
> You can use the **State/Province** box to create recipient conditions for dynamic distribution groups, email address policies, or address lists.

Email Address

Use the **Email Address** section to view or change the email addresses associated with the room mailbox. This includes the mailbox's primary SMTP address and any associated proxy addresses. The primary SMTP address (also known as the *reply address*) is displayed in bold text in the address list, with the uppercase **SMTP** value in the **Type** column.

- **Add**: Click **Add** + to add a new email address for this mailbox. Select one of following address types:
  - **SMTP**: This is the default address type. Click this button and then type the new SMTP address in the **Email address** box.
  - **EUM**: An EUM (Exchange Unified Messaging) address is used by the Microsoft Exchange Unified Messaging service in Exchange 2016 to locate UM-enabled recipients within an Exchange organization. EUM addresses consist of the extension number and the UM dial plan for the UM-enabled user. Click this button and type the extension number in the **Address/Extension** box. Then click **Browse** and select a dial plan for the mailbox. (**Note**: Unified Messaging is not available in Exchange 2019.)
  - **Custom address type**: Click this button and type one of the supported non-SMTP email address types in the **Email address** box.

Notes:

- With the exception of X.400 addresses, Exchange doesn't validate custom addresses for correct formatting. You must make sure that the custom address you specify complies with the format requirements for that address type.

- When you add a new email address, you have the option to make it the primary SMTP address.

- **Automatically update email addresses based on the email address policy applied to this recipient**: Select this check box to have the recipient's email addresses automatically updated based on changes made to email address policies in your organization.

MailTip

Use the **MailTip** section to add a MailTip to alert users of potential issues before they send a booking request to the room mailbox. A MailTip is text that's displayed in the InfoBar when this recipient is added to the To, Cc, or Bcc lines of a new email message.

> **NOTE**
>
> MailTips can include HTML tags, but scripts aren't allowed. The length of a custom MailTip can't exceed 175 displayed characters. HTML tags aren't counted in the limit.

Use the Exchange Management Shell to change room mailbox properties

Use the following sets of cmdlets to view and change room mailbox properties: **Get-Mailbox** and **Set-Mailbox** cmdlets to view and change general properties and email addresses for room mailboxes. Use the **Get-CalendarProcessing** and **Set-CalendarProcessing** cmdlets to view and change delegates and booking options.

- **Get-User** and **Set-User**: Use these cmdlets to view and set general properties such as location, department, and company names.

- **Get-Mailbox** and **Set-Mailbox**: Use these cmdlets to view and set mailbox properties, such as email addresses and the mailbox database.

- **Get-CalendarProcessing** and **Set-CalendarProcessing**: Use these cmdlets to view and set booking options and delegates.

For information about these cmdlets, see the following topics:

- Get-User

- Set-User

- Get-Mailbox

- Set-Mailbox

- Get-CalendarProcessing

- Set-CalendarProcessing

Here are some examples of using the Exchange Management Shell to change room mailbox properties.

This example changes the display name, the primary SMTP address (called the default reply address), and the room capacity. Also, the previous reply address is kept as a proxy address.

```
Set-Mailbox "Conf Room 123" -DisplayName "Conf Room 31/123 (12)" -EmailAddresses
SMTP:Rm33.123@contoso.com,smtp:rm123@contoso.com -ResourceCapacity 12
```

This example configures room mailboxes to allow booking requests to be scheduled only during working hours and sets a maximum duration of 9 hours.

```
Get-Mailbox -ResultSize unlimited -Filter "RecipientTypeDetails -eq 'RoomMailbox'" | Set-CalendarProcessing -
ScheduleOnlyDuringWorkHours $true -MaximumDurationInMinutes 540
```

This example uses the **Get-User** cmdlet to find all room mailboxes that correspond to private conference rooms, and then uses the **Set-CalendarProcessing** cmdlet to send booking requests to a delegate named Robin Wood to accept or decline.

```
Get-User -ResultSize unlimited -Filter "(RecipientTypeDetails -eq 'RoomMailbox') -and (DisplayName -like
'Private*')" | Set-CalendarProcessing -AllBookInPolicy $false -AllRequestInPolicy $true -ResourceDelegates
"Robin Wood"
```

Create a room list

If you're planning to have more to have hundreds of rooms, use multiple room lists to help you organize your rooms. If your company has several buildings with rooms that can be booked for meetings, it might help to create room lists for each building. Room lists are specially marked distribution groups that you can use the same way you use distribution groups. However, you can only create room lists using the Exchange Management Shell.

> **NOTE**
>
> Although there is no hard limit to the number of rooms you can have in a Room List, the maximum number of rooms that can be returned in request for a Room List is 100. A possible workaround would be to further break down your rooms into smaller lists.

Use the Exchange Management Shell to create a room list

This example creates a room list for building 32.

```
New-DistributionGroup -Name "Building 32 Conference Rooms" -OrganizationalUnit "contoso.com/rooms" -RoomList
```

Use the Exchange Management Shell to add a room to a room list

This example adds confroom3223 to the building 32 room list.

```
Add-DistributionGroupMember -Identity "Building 32 Conference Rooms" -Member confroom3223@contoso.com
```

Use the Exchange Management Shell to convert a distribution group to a room list

You may already have created distribution groups in the past that contain your conference rooms. You don't need to recreate them; we can convert them quickly into a room list.

This example converts the distribution group, building 34 conference rooms, to a room list.

```
Set-DistributionGroup -Identity "Building 34 Conference Rooms" -RoomList
```

How do you know this worked?

To verify that you've successfully changed properties for a room mailbox, do the following:

- In the Exchange admin center, select the mailbox and then click **Edit** ✎ to view the property or feature that you changed. Depending on the property that you changed, it might be displayed in the Details pane for the selected mailbox.

- In the Exchange Management Shell, use the **Get-Mailbox** cmdlet to verify the changes. One advantage of using the Exchange Management Shell is that you can view multiple properties for multiple mailboxes. In the example above where booking requests could be scheduled only during working hours and have a maximum duration of 9 hours, run the following command to verify the new values.

  ```
  Get-Mailbox -ResultSize unlimited -Filter "RecipientTypeDetails -eq 'RoomMailbox'" | Get-
  CalendarProcessing | Format-List Identity,ScheduleOnlyDuringWorkHours,MaximumDurationInMinutes
  ```

Manage equipment mailboxes

8/3/2020 • 12 minutes to read • Edit Online

In Exchange Server, an *equipment mailbox* is a resource mailbox assigned to a resource that's not location specific, such as a portable computer, projector, microphone, or a company car. After an administrator creates an equipment mailbox, users can easily reserve the piece of equipment by including the corresponding equipment mailbox in a meeting request. You can use the Exchange admin center (EAC) and the Exchange Management Shell to create an equipment mailbox or change equipment mailbox properties. For more information, see Recipients.

For information about another type of resource mailbox, a room mailbox, see Create and manage room mailboxes.

What do you need to know before you begin?

- Estimated time to complete: 2 to 5 minutes.
- To open the EAC, see Exchange admin center in Exchange Server. To open the Exchange Management Shell, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Create an equipment mailbox

Use the EAC to create an equipment mailbox

1. In the EAC, navigate to **Recipients** > **Resources**.
2. To create an equipment mailbox, click **New** > **Equipment mailbox**. To create a room mailbox, click **New** > **Room mailbox**.
3. Use the options on the page to specify the settings for the new resource mailbox.

   - *** Equipment name**: Use this box to type a name for the equipment mailbox. This is the name that's listed in the resource mailbox list in the EAC and in your organization's address book. This name is required and it can't exceed 64 characters.

   > **TIP**
   >
   > Although there are other fields that describe the details of the room, for example, Capacity, consider summarizing the most important details in the equipment name using a consistent naming convention. Why? So users can easily see the details when they select the equipment from the address book in a meeting request.

   - *** Email address**: An equipment mailbox has an email address to receive booking requests. The email address consists of an alias on the left side of the @ symbol, which must be unique in the forest, and your domain name on the right. The email address is required.

4. When you're finished, click **Save** to create the equipment mailbox.

Once you've created your equipment mailbox, you can edit your equipment mailbox to update info about booking options, MailTips and delegates. Check out the Change equipment mailbox properties section below to change room mailbox properties.

Use the Exchange Management Shell to create an equipment mailbox

This example creates an equipment mailbox with the following configuration:

- The equipment mailbox resides on Mailbox Database 1.
- The equipment's name is MotorVehicle2 and the name will display in the GAL as Motor Vehicle 2.
- The email address is MotorVehicle2@contoso.com.
- The mailbox is in the Equipment organizational unit.
- The *Equipment* parameter specifies that this mailbox will be created as an equipment mailbox.

```
New-Mailbox -Database "Mailbox Database 1" -Name MotorVehicle2 -OrganizationalUnit Equipment -DisplayName
"Motor Vehicle 2" -Equipment
```

For detailed syntax and parameter information, see New-Mailbox.

How do you know this worked?

To verify that you've successfully created a user mailbox, do one of the following:

- In the EAC, navigate to **Recipients** > **Resources**. The new user mailbox is displayed in the mailbox list. Under **Mailbox Type**, the type is **Equipment**.
- In the Exchange Management Shell, run the following command to display information about the new equipment mailbox.

  ```
  Get-Mailbox <Name> | Format-List Name,RecipientTypeDetails,PrimarySmtpAddress
  ```

Change equipment mailbox properties

After you create an equipment mailbox, you can make changes and set additional properties by using the EAC or the Exchange Management Shell.

Use the EAC to change equipment mailbox properties

1. In the EAC, navigate to **Recipients** > **Resources**.
2. In the list of resource mailboxes, click the equipment mailbox that you want to change the properties for, and then click **Edit** ✎.
3. On the equipment mailbox properties page, click one of the following sections to view or change properties.
   - General
   - Delegates
   - Booking Options
   - Contact Information

- Email Address
- MailTip

General

Use the **General** section to view or change basic information about the resource.

- *** Equipment name**: This name appears in the resource mailbox list in the EAC and in your organization's address book. It can't exceed 64 characters if you change it.
- *** Email address**: This read-only box displays the email address for the equipment mailbox. You can change it in the Email Address section.
- **Capacity**: Use this box to enter the maximum number of people who can use this resource, if applicable, For example, if the equipment mailbox corresponds to a compact car, you could enter **4**.

Click **More options** to view or change these additional properties:

- **Organizational unit**: This read-only box displays the organizational unit (OU) that contains the account for the equipment mailbox. You have to use Active Directory Users and Computers to move the account to a different OU.
- **Mailbox database**: This read-only box displays the name of the mailbox database that hosts the equipment mailbox. Use the **Migration** page in the EAC to move the mailbox to a different database.
- *** Alias** Use this box to change the alias for the equipment mailbox.
- **Hide from address lists**: Select this check box to prevent equipment mailbox from appearing in the address book and other address lists that are defined in your Exchange organization. After you select this check box, users can still send booking messages to the equipment mailbox by using the email address.
- **Department**: Use this box to specify a department name that the resource is associated with. You can use this property to create recipient conditions for dynamic distribution groups and address lists.
- **Company**: Use this box to specify a company that the resource is associated with. Like the Department property, you can use this property to create recipient conditions for dynamic distribution groups and address lists.
- **Address book policy**: Use this option to specify an address book policy (ABP) for the resource. ABPs contain a global address list (GAL), an offline address book (OAB), a room list, and a set of address lists. To learn more, see Address book policies in Exchange Server.

  In the drop-down list, select the policy that you want associated with this mailbox.
- **Custom attributes**: This section displays the custom attributes defined for the equipment mailbox. To specify custom attribute values, click **Edit** ✎. You can specify up to 15 custom attributes for the recipient.

Delegates

Use this section to view or change how the equipment mailbox handles reservation requests and to define who can accept or decline booking requests if it isn't done automatically.

- **Booking requests**: Select one of the following options to handle booking requests.
  - **Accept or decline booking requests automatically**: A valid meeting request automatically reserves the resource. If there's a scheduling conflict with an existing reservation, or if the booking request violates the scheduling limits of the resource, for example, the reservation duration is too long, the meeting request is automatically declined.
  - **Select delegates who can accept or decline booking requests**: Resource delegates are responsible for accepting or declining meeting requests that are sent to the equipment mailbox. If

you assign more than one resource delegate, only one of them has to act on a specific meeting request.

- **Delegates**: If you selected the option requiring that booking requests be sent to delegates, the specified delegates are listed. Click **Add** + or **Remove** − to add or remove delegates from this list.

Booking Options

Use the **Booking Options** section to view or change the settings for the booking policy that defines when the resource can be scheduled, how long it can be reserved, and how far in advance it can be reserved.

- **Allow repeating meetings**: This setting allows or prevents repeating meetings for the resource. By default, this setting is enabled, so repeating meetings are allowed.

- **Allow scheduling only during working hours**: This setting accepts or declines meeting requests that aren't during the working hours defined for the resource. By default, this setting is disabled, so meeting requests are allowed outside the working hours.By default, working hours are 8:00 AM to 5:00 PM Monday through Friday. You can configure the working hours of the equipment mailbox in the Appearance section on the Calendar page.

- **Always decline if the end date is beyond this limit**: This setting controls the behavior of repeating meetings that extend beyond the date specified by the maximum booking lead time setting.

  - If you enable this setting, a repeating booking request is automatically declined if the bookings start on or before the date specified by the value in the **Maximum booking lead time** box, and they extend beyond the specified date. This is the default setting.

  - If you disable this setting, a repeating booking request is automatically accepted if the booking requests start on or before the date specified by the value in the **Maximum booking lead time** box, and they extend beyond the specified date. However, the number of bookings is reduced so bookings won't occur after the specified date.

- **Maximum booking lead time (days)**: This setting specifies the maximum number of days in advance that the resource can be booked. Valid input is an integer between 0 and 1080. The default value is 180 days.

- **Maximum duration (hours)**: This setting specifies the maximum duration that the resource can be reserved in a booking request. The default value is 24 hours.

  For repeating booking requests, the maximum booking duration applies to the length of each instance of the repeating booking request.

There is also a box on this page that you can use to write a message that will be sent to users who send meeting requests to reserve the resource.

Contact Information

Use the **Contact Information** section to view or change the contact information for the resource. The information on this page is displayed in the address book.

> **TIP**
>
> You can use the **State/Province** box to create recipient conditions for dynamic distribution groups, email address policies, or address lists.

Email Address

Use the **Email Address** section to view or change the email addresses associated with the equipment mailbox. This includes the mailbox's primary SMTP address and any associated proxy addresses. The primary SMTP address (also known as the *reply address*) is displayed in bold text in the address list, with the uppercase **SMTP** value in the **Type** column.

- **Add**: Click **Add** + to add a new email address for this mailbox. Select one of following address types:
  - **SMTP**: This is the default address type. Click this button and then type the new SMTP address in the * **Email address** box.
  - **EUM**: An Exchange Unified Messaging (EUM) address is used by the Exchange Unified Messaging service in Exchange 2016 to locate UM-enabled recipients in an Exchange organization. EUM addresses consist of the extension number and the UM dial plan for the UM-enabled user. Click this button and type the extension number in the **Address/Extension** box. Then click **Browse** and select a dial plan for the mailbox.(**Note**: Unified Messaging is not available in Exchange 2019.)
  - **Custom address type**: Click this button and type one of the supported non-SMTP email address types in the * **Email address** box.

    Notes:

    - With the exception of X.400 addresses, Exchange doesn't validate custom addresses for correct formatting. You must make sure that the custom address you specify complies with the format requirements for that address type.
    - When you add a new email address, you have the option to make it the primary SMTP address.
- **Automatically update email addresses based on the email address policy applied to this recipient**: Select this check box to have the recipient's email addresses automatically updated based on changes made to email address policies in your organization.

MailTip

Use the **MailTip** section to add a MailTip to alert users of potential issues before they send a booking request to the equipment mailbox. A MailTip is text that's displayed in the InfoBar when this recipient is added to the To, Cc, or Bcc lines of a new email message.

> **NOTE**
>
> MailTips can include HTML tags, but scripts aren't allowed. The length of a custom MailTip can't exceed 175 displayed characters. HTML tags aren't counted in the limit.

Use the Exchange Management Shell to change equipment mailbox properties

Use the following sets of cmdlets to view and change equipment mailbox properties: **Get-Mailbox** and **Set-Mailbox** cmdlets to view and change general properties and email addresses for equipment mailboxes. Use the **Get-CalendarProcessing** and **Set-CalendarProcessing** cmdlets to view and change delegates and booking options.

- **Get-User** and **Set-User**: Use these cmdlets to view and set general properties such as department and company names.
- **Get-Mailbox** and **Set-Mailbox**: Use these cmdlets to view and set mailbox properties, such as email addresses and the mailbox database.
- **Get-CalendarProcessing** and **Set-CalendarProcessing**: Use these cmdlets to view and set booking options and delegates.

For information about these cmdlets, see the following topics:

- Get-User

- Set-User
- Get-Mailbox
- Set-Mailbox
- Get-CalendarProcessing
- Set-CalendarProcessing

Here are some examples of using the Exchange Management Shell to change equipment mailbox properties.

This example changes the display name and primary SMTP address (called the default reply address) for the MotorPool 1 equipment mailbox. The previous reply address is kept as a proxy address.

```
Set-Mailbox "MotorPool 1" -DisplayName "Motor Pool 1 - Compact" -EmailAddresses
SMTP:MP1.compact@contoso.com,smtp:MP.1@contoso.com
```

This example configures equipment mailboxes to allow booking requests to be scheduled only during working hours.

```
Get-Mailbox -ResultSize unlimited -Filter "RecipientTypeDetails -eq 'EquipmentMailbox'" | Set-
CalendarProcessing -ScheduleOnlyDuringWorkHours $true
```

This example uses the **Get-User** cmdlet to find all equipment mailboxes in the Audio Visual department, and then uses the **Set-CalendarProcessing** cmdlet to send booking requests to a delegate named Ann Beebe to accept or decline.

```
Get-User -ResultSize unlimited -Filter "(RecipientTypeDetails -eq 'EquipmentMailbox') -and (Department -eq
'Audio Visual')" | Set-CalendarProcessing -AllBookInPolicy $false -AllRequestInPolicy $true -ResourceDelegates
"Ann Beebe"
```

How do you know this worked?

To verify that you've successfully changed properties for an equipment mailbox, do the following:

- In the EAC, select the mailbox and then click **Edit** ✎ to view the property or feature that you changed. Depending on the property that you changed, it might be displayed in the Details pane for the selected mailbox.

- In the Exchange Management Shell, use the **Get-Mailbox** cmdlet to verify the changes. One advantage of using the Exchange Management Shell is that you can view multiple properties for multiple mailboxes. In the example above where booking requests could be scheduled only during working hours, run the following command to verify the new value.

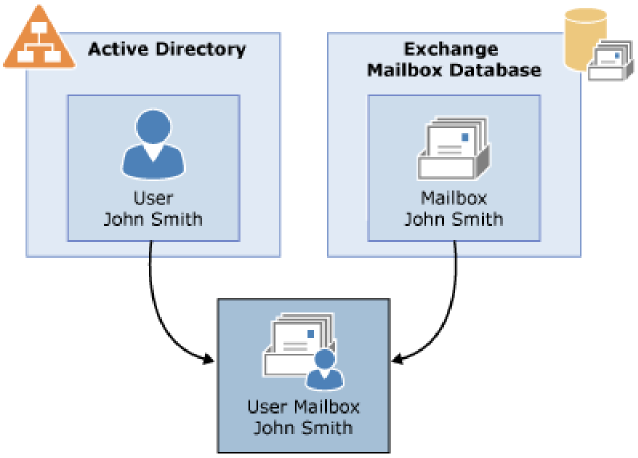
  ```
  Get-Mailbox -ResultSize unlimited -Filter "RecipientTypeDetails -eq 'EquipmentMailbox'" | Get-
  CalendarProcessing | Format-List Identity,ScheduleOnlyDuringWorkHours
  ```

Disconnected mailboxes

8/3/2020 • 8 minutes to read • Edit Online

Each Microsoft Exchange mailbox consists of an Active Directory user account and the mailbox data stored in the Exchange mailbox database. All configuration data for a mailbox is stored in the Exchange attributes of the Active Directory user object. The mailbox database contains the mail data that's in the mailbox associated with the user account. The following figure shows the components of a mailbox.

Mailbox components



A *disconnected mailbox* is a mailbox object in the mailbox database that isn't associated with an Active Directory user account. There are two types of disconnected mailboxes:

- **Disabled mailboxes**: When a mailbox is disabled or deleted in the Exchange admin center (EAC) or using the **Disable-Mailbox** or **Remove-Mailbox** cmdlet in the Exchange Management Shell, Exchange retains the deleted mailbox in the mailbox database, and switches the mailbox to a disabled state. This is why mailboxes that are either disabled or deleted are referred to as *disabled mailboxes*. The difference is that when you disable a mailbox, the Exchange attributes are removed from the corresponding Active Directory user account, but the user account is retained. When you delete a mailbox, both the Exchange attributes and the Active Directory user account are deleted.

  Disabled and deleted mailboxes are retained in the mailbox database until the deleted mailbox retention period expires, which is 30 days by default. After the retention period expires, the mailbox is permanently deleted (also called *purged*). If a mailbox is deleted using the **Remove-Mailbox** cmdlet, it's also retained for the duration of the retention period.

  > **IMPORTANT**
  >
  > If a mailbox is deleted using the **Remove-Mailbox** cmdlet and either the *Permanent* or *StoreMailboxIdentity* parameter, it will be immediately deleted from the mailbox database.

  To identify the disabled mailboxes in your organization, run the following commands in the Exchange Management Shell:

  ```
  $dbs = Get-MailboxDatabase
  $dbs | foreach {Get-MailboxStatistics -Database $_.DistinguishedName} | where {$_.DisconnectReason -eq
  "Disabled"} | Format-Table DisplayName,Database,DisconnectDate
  ```

- **Soft-deleted mailboxes**: When a mailbox is moved to a different mailbox database, Exchange doesn't fully delete the mailbox from the source mailbox database when the move is complete. Instead, the mailbox in the source mailbox database is switched to a *soft-deleted* state. Like disabled mailboxes, soft-deleted mailboxes are retained in the source database either until the deleted mailbox retention period expires or until the **Remove-StoreMailbox** cmdlet is used to purge the mailbox.

  Run the following commands to identify soft-deleted mailboxes in your organization.

  ```
  $dbs = Get-MailboxDatabase
  $dbs | foreach {Get-MailboxStatistics -Database $_.DistinguishedName} | where {$_.DisconnectReason -eq
  "SoftDeleted"} | Format-Table DisplayName,Database,DisconnectDate
  ```

Working with disabled mailboxes

You can perform several operations on a disabled mailbox before it's purged from the mailbox database:

- Reconnect it to the same user account.

- Connect it to a different user account that isn't mail-enabled, which means the user account doesn't have a mailbox.

- Restore it to a user account that has an existing mailbox. For example, if a user whose mailbox was deleted has a new mailbox, you can restore the user's disabled mailbox to their new mailbox.

- Permanently delete it from the Exchange mailbox database.

Connecting or restoring a disabled mailbox

Here are scenarios in which you may want to connect or restore a disabled mailbox before the mailbox retention period expires or before it's permanently deleted:

- You disabled a mailbox and now want to reconnect the mailbox to the same Active Directory user account.

- You deleted a mailbox by using the EAC or the Remove-Mailbox cmdlet and now want to reconnect the mailbox to a different Active Directory user account.

- You deleted a mailbox and now want to restore the mailbox to an existing mailbox. For example, if a user whose mailbox was deleted has a new mailbox, you can restore the user's disabled mailbox to their new mailbox.

- You want to convert a user mailbox to a linked mailbox associated with a user account that's external to the forest in which your Exchange organization exists. The resource forest scenario is an example of when you would want to associate a mailbox with an external account. In this scenario, user objects in the Exchange forest have mailboxes, but the user objects are disabled for logon. You must associate a mailbox in the Exchange forest with a user account in the external account forest.

There are two ways you can reconnect or restore a disabled mailbox. The first method is to use the EAC or the **Connect-Mailbox** cmdlet to connect a disabled mailbox to a user account. For procedures to reconnect disabled mailboxes, see Connect a disabled mailbox.

The second method uses the **New-MailboxRestoreRequest** cmdlet to merge the contents of the disabled mailbox with an existing mailbox. This cmdlet uses the Mailbox Replication Service (MRS) to restore the mailbox. For procedures to restore disabled mailboxes, see Connect or restore a deleted mailbox.

Permanently deleting a disabled mailbox

As stated previously, Exchange retains disabled mailboxes in the mailbox database based on the deleted mailbox retention settings configured for that mailbox database. After the specified retention period, a disabled mailbox is purged from the Exchange mailbox database. You can also permanently delete a disabled mailbox and all its message content from the mailbox database by using the **Remove-StoreMailbox** cmdlet. After a disabled mailbox is automatically purged or permanently deleted by an administrator, the data loss is permanent and the mailbox can't be recovered.

For more information, see Permanently delete a mailbox.

Working with disabled archive mailboxes

Archive mailboxes become disconnected when they're disabled. Similar to a disabled primary mailbox, a disconnected archive mailbox can be connected by using the **Connect-Mailbox** cmdlet with the *Archive* parameter.

The primary mailbox and the archive mailbox share the same legacy distinguished name (DN), so you must connect the archive mailbox to the same user mailbox that it was previously connected to. You can't connect the archive mailbox to a different user mailbox.

You can perform two operations on a disconnected archive mailbox:

- **Connect it to an existing primary mailbox**: Like a disconnected primary mailbox, a disconnected archive mailbox is retained in the mailbox database until the deleted mailbox retention period expires, which is 30 days by default. During this time, you can recover the archive mailbox by reconnecting it to the same user account that it was connected to before it was disabled.

  > **NOTE**
  >
  > If you disable an archive mailbox for a user mailbox and then enable an archive mailbox for that same user, that user mailbox will get a new archive mailbox. While you can use the **Connect-Mailbox** cmdlet to connect a primary mailbox to a user, you must use the **Enable-Mailbox** cmdlet to connect a disabled archive mailbox to an existing mailbox.

  For more information, see Manage In-Place Archives in Exchange Server.

- **Permanently delete it from the Exchange mailbox database**: Exchange retains disconnected archive mailboxes based on the deleted mailbox retention settings configured for the mailbox database. The default retention period is 30 days. After the specified mailbox retention period, a disconnected archive mailbox is purged from the Exchange mailbox database.

  Like a disabled primary mailbox, you can permanently delete a disabled archive mailbox at any time by using the **Remove-StoreMailbox** cmdlet. For more information, see Permanently delete a mailbox.

Working with soft-deleted mailboxes

A soft-deleted mailbox is created when a mailbox is moved from one Exchange mailbox database to any other mailbox database. Exchange doesn't fully delete the mailbox from the source database after a move in case an error occurs during the move that causes the mailbox on the destination database to fail. You can always restore the source mailbox and try again. Exchange will retain the soft-deleted mailbox for the duration of the mailbox retention period.

You can perform two operations on a soft-deleted mailbox:

- Restore it to an existing mailbox.

- Permanently delete it from the Exchange mailbox database.

The procedures for restoring and permanently deleting a soft-deleted mailbox are similar to those for a disabled mailbox. For more information, see the following topics:

- Connect or restore a deleted mailbox
- Permanently delete a mailbox

Summary of working with disconnected mailboxes

The following table summarizes the information about disconnected mailboxes, including how the mailbox was disconnected, what happens to the corresponding Active Directory user account when a mailbox is disconnected, and the options and tools you have to connect or restore disconnected mailboxes.

HOW MAILBOX WAS DISABLED	VALUE OF *DISCONNECTREASON* PROPERTY	IS ACTIVE DIRECTORY USER ACCOUNT RETAINED?	CONNECT OR RESTORE OPTIONS	TOOLS
The EAC: **Recipients** > **Mailboxes** > **Disable** The Exchange Management Shell: **Disable-Mailbox** cmdlet	Disabled	Yes	Connect to same user account	The EAC: **Recipients** > **Mailboxes** > **Connect a Mailbox** The Exchange Management Shell: **Connect-Mailbox** cmdlet
The EAC: **Recipients** > **Mailboxes** > **Delete** The Exchange Management Shell: **Remove-Mailbox** cmdlet	Disabled	No	Connect to a different user account Restore to a different mailbox	The EAC: **Recipients** > **Mailboxes** > **Connect a Mailbox** The Exchange Management Shell: • **Connect-Mailbox** cmdlet • **Enable-Mailbox** cmdlet • **New-MailboxRestore** cmdlet
Moved to a different mailbox database	SoftDeleted	Yes	Connect to a different user account Restore to a different mailbox	The EAC: **Recipients** > **Mailboxes** > **Connect a Mailbox** The Exchange Management Shell: • **Connect-Mailbox** cmdlet • **Enable-Mailbox** cmdlet • **New-MailboxRestore** cmdlet

Disconnected mailbox documentation

The following table contains links to topics that will help you manage disconnected mailboxes. This includes managing disconnected user mailboxes, linked mailboxes, resource mailboxes, and shared mailboxes.

TOPIC	DESCRIPTION
Disable or delete a mailbox in Exchange Server	Learn how to disable or delete mailboxes.

TOPIC	DESCRIPTION
Connect a disabled mailbox	Learn how to connect a disabled mailbox to an existing user account.
Connect or restore a deleted mailbox	Learn how to connect a deleted mailbox to a user account or restore the contents of a deleted mailbox to an existing mailbox.
Manage Mailbox Restore Requests	Learn how to manage mailbox restore requests using the Exchange Management Shell.
Permanently delete a mailbox	Learn how to permanently delete a mailbox.

Disable or delete a mailbox in Exchange Server

8/3/2020 • 7 minutes to read • Edit Online

In Exchange Server, you can use the Exchange admin center (EAC) or the Exchange Management Shell to disable or delete mailboxes. Disabled or deleted mailboxes are also known as *disconnected mailboxes*. For more information about disconnected mailboxes, see Disconnected mailboxes.

Note: If you need to delete a mailbox in Microsoft 365 or Office 365, see Delete or Restore User Mailboxes in Exchange Online.

What do you need to know before you begin?

- Estimated time to complete each procedure: 2 minutes.
- For more information about accessing and using the EAC, see Exchange admin center in Exchange Server. To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Disable mailboxes

When you disable a mailbox, all Exchange attributes are removed from the associated user account in Active Directory. The disconnected mailbox is hidden and marked for removal. The disconnected mailbox is permanently deleted (purged) based on the **MailboxRetention** property value for the mailbox database (the default value is 30 days). Before the mailbox is purged, you can reconnect it to a new or existing user account that doesn't already have an associated mailbox. For more information, see Connect a disabled mailbox.

Note: Disabling a mailbox that has an associated archive marks both the primary and archive mailboxes for removal. To only mark the archive mailbox for removal without affecting the primary mailbox, see Disable an archive mailbox.

Use the EAC to disable a mailbox

1. In the EAC, go to **Recipients**, and click the tab for the type of mailbox that you want to disable:
   - **Mailboxes** for user mailboxes and linked mailboxes.
   - **Shared** for shared mailboxes.
2. Find and select the mailbox that you want to disable. For example:
   - Scroll through the list. You can also click the column headers to sort the mailboxes.

  - Click **Search** and enter the text to filter the list of mailboxes.

  - Select multiple mailboxes by selecting a mailbox, holding the Shift key, and selecting a mailbox farther down in the list, or by holding down the CTRL key as you select each mailbox.

3. After you've selected the mailbox or mailboxes that you want to disable, click **More** •••, select **Disable**, and then click **Yes** in the warning message that appears.

Use the Exchange Management Shell to disable a mailbox

To disable a mailbox, use this syntax:

```
Disable-Mailbox <MailboxIdentity> [-Arbitration] [-Archive] [-PublicFolder] [-RemoteArchive]
```

This example disables the user mailbox that has the alias value danj.

```
Disable-Mailbox danj
```

This example disables the room mailbox named Conf Room 31/1234 (12).

```
Disable-Mailbox "Conf Room 31/1234 (12)"
```

This example disables the shared mailbox that has the email address sharedmbx@contoso.com.

```
Disable-Mailbox sharedmbx@contoso.com
```

For detailed syntax and parameter information, see Disable-Mailbox.

How do you know this worked?

To verify that you've successfully disabled a mailbox, do any of these steps:

- In the EAC, click **Recipients**, go to the appropriate tab for the type of mailbox that you disabled, and verify that the mailbox is no longer listed. Note that you might need to click **Refresh** 🔄.

- In Active Directory Users and Computers, right-click the user account whose mailbox you disabled, and then click **Properties**. On the **General** tab, verify that the **E-mail** field is blank.

- In the Exchange Management Shell, replace *<DisplayName>* with the user's display name, and run the following commands to verify the **DisconnectReason** property value is `Disabled` (which indicates the mailbox has been marked for removal):

  ```
  $dbs = Get-MailboxDatabase
  $dbs | foreach {Get-MailboxStatistics -Database $_.DistinguishedName} | where {$_.DisplayName -eq "
  <DisplayName>"} | Format-List DisconnectReason,DisconnectDate
  ```

  Notes:

  - The **DisconnectReason** property doesn't distinguish between disabled and deleted mailboxes (the value for both is `Disabled`). The presence of the associated user account indicates whether the mailbox was disabled.

    When you delete a mailbox, the value of the **DisconnectReason** property is also `Disabled`, but the corresponding Active Directory user account is also deleted.

  - If the command returns no results, replace *<DatabaseName>* with the name of the mailbox database where the disconnected mailbox resides, and run this command to synchronize the mailbox state for all disconnected mailboxes on the database:

```
Get-MailboxStatistics -Database "<DatabaseName>" | foreach {Update-StoreMailboxState -Database
$_.Database -Identity $_.MailboxGuid -Confirm:$false}
```

Then, run the previous command, which should now return results.

- In the Exchange Management Shell, replace *<UserIdentity>* with the name or user principal name of the user (for example, user@contoso.com), and run this command to verify that the **RecipientType** property value is `User`, not `UserMailbox`.

```
Get-User -Identity <UserIdentity>
```

Delete mailboxes

When you delete a mailbox, the mailbox is disconnected from the associated user account, and the account is removed from Active Directory. The disconnected mailbox is hidden and marked for removal. The disconnected mailbox is permanently deleted (purged) based on the **MailboxRetention** property value for the mailbox database (the default value is 30 days). Before the mailbox is purged, you can reconnect it to a new or existing user account that doesn't already have an associated mailbox. For more information, see Connect or restore a deleted mailbox.

Note: Deleting a mailbox that has an associated archive marks both the primary and archive mailboxes for removal. To only mark the archive mailbox for removal without affecting the primary mailbox, see Disable an archive mailbox.

Use the EAC to delete a mailbox

1. In the EAC, go to the location for the type of mailbox that you want to delete:
   - **Recipients** > **Mailboxes** for user mailboxes and linked mailboxes.
   - **Recipients** > **Resources** for room and equipment mailboxes.
   - **Recipients** > **Shared** for shared mailboxes.
   - **Public folders** > **Public folder mailboxes** for public folder mailboxes.
2. Find and select the mailbox that you want to disable. For example:
   - Scroll through the list. You can also click the column headers to sort the mailboxes.
   - Click **Search** and enter the text to filter the list of mailboxes.
   - Select multiple mailboxes by selecting a mailbox, holding the Shift key, and selecting a mailbox farther down in the list, or by holding down the CTRL key as you select each mailbox.
3. After you've selected the mailbox or mailboxes that you want to delete, click **Delete** 🗑, and then click **Yes** in the warning message that appears.

Use the Exchange Management Shell to delete a mailbox

To delete a mailbox, use this syntax:

```
Remove-Mailbox <MailboxIdentity> [-Arbitration] [-PublicFolder]
```

This example deletes the mailbox that has the email address pilarp@contoso.com.

```
Remove-Mailbox pilarp@contoso.com
```

This example deletes the equipment mailbox named Fleet Van (16).

```
Remove-Mailbox "Fleet Van (16)"
```

This example deletes the mailbox that has the alias value corpprint.

```
Remove-Mailbox corpprint
```

For detailed syntax and parameter information, see Remove-Mailbox.

Note: If you use the **Remove-Mailbox** cmdlet with the *Purge* switch, the mailbox is immediately purged and isn't recoverable. For more information, see Permanently delete a mailbox.

How do you know this worked?

To verify that you've successfully deleted a mailbox, do any of these steps:

- In the EAC, click **Recipients**, go to the appropriate tab for the type of mailbox that you deleted, and verify that the mailbox is no longer listed. Note that you might need to click **Refresh** 🔄.

- In Active Directory Users and Computers, verify that the associated account is no longer listed. Note that mailbox types other than user and linked mailboxes also have associated user accounts that are disabled (for example, room, equipment, arbitration, shared, and public folder mailboxes).

- In the Exchange Management Shell replace *<DisplayName>* with the user's display name, and run the following commands to verify the **DisconnectReason** property value is `Disabled` (which indicates the mailbox has been marked for removal):

  ```
  $dbs = Get-MailboxDatabase
  $dbs | foreach {Get-MailboxStatistics -Database $_.DistinguishedName} | where {$_.DisplayName -eq "
  <DisplayName>"} | Format-List DisconnectReason,DisconnectDate
  ```

  Notes:

  - The **DisconnectReason** property doesn't distinguish between disabled and deleted mailboxes (the value for both is `Disabled`). The absence of the associated user account indicates whether the mailbox was deleted.

  - If the command returns no results, replace *<DatabaseName>* with the name of the mailbox database where the disconnected mailbox resides, and run the following command to synchronize the mailbox state for all disconnected mailboxes on the database:

    ```
    Get-MailboxStatistics -Database "<DatabaseName>" | foreach {Update-StoreMailboxState -Database
    $_.Database -Identity $_.MailboxGuid -Confirm:$false}
    ```

    Then, run the previous command, which should now return results.

- In the Exchange Management Shell, replace *<UserIdentity>* with the name or user principal name of the user (for example, user@contoso.com), and run this command to verify that the user can't be found.

  ```
  Get-User <UserIdentity>
  ```

More information

When you delete the Active Directory user account that's associated with a mailbox, Exchange will detect that the mailbox is no longer connected to a user account, and will mark the mailbox for removal, even if the mailbox has been placed on Litigation Hold or In-Place Hold. To retain the mailbox, do these steps:

- Instead of deleting the user account, disable the user account.
- Change the properties of the mailbox to restrict its use and who has access to the mailbox. For example, set send and receive quotas equal to 1, block who can send messages to the mailbox, and restrict who has access the mailbox.
- Retain the mailbox until all data has been expunged, or until preserving the data is no longer required.

For more information, see In-Place Hold and Litigation Hold in Exchange Server.

Connect a disabled mailbox

8/3/2020 • 5 minutes to read • Edit Online

When you disable a mailbox, Exchange retains the mailbox in the mailbox database and switches the mailbox to a disabled state. The Exchange attributes are also removed from the corresponding Active Directory user account, but the user account is retained. The mailbox is retained until the deleted mailbox retention period expires, which is 30 days by default, before it's then deleted permanently (or *purged*) from the mailbox database.

Until a disabled mailbox is permanently deleted from the Exchange mailbox database, you can use the EAC or the Exchange Management Shell to reconnect it to the original Active Directory user account.

To learn more about disconnected mailboxes and perform other related management tasks, see the following topics:

- Disconnected mailboxes
- Disable or delete a mailbox in Exchange Server
- Connect or restore a deleted mailbox
- Permanently delete a mailbox

What do you need to know before you begin?

- Estimated time to complete: 2 minutes.
- To open the EAC, see Exchange admin center in Exchange Server. To open the Exchange Management Shell, see Open the Exchange Management Shell.
- Run the **Get-User** cmdlet in theExchange Management Shell to verify that the Active Directory user account that you want to connect the disabled mailbox to exists and that it isn't already associated with another mailbox. To connect a disabled mailbox to a user account, the account must exist and the value for the *RecipientType* property has to be `User`, which indicates that the account isn't already mailbox-enabled.

  You can also verify this information in Active Directory Users and Computers.

- Replace *<DisplayName>* with the display name of the mailbox, and run the following commands in the Exchange Management Shell to verify that the disabled mailbox that you want to connect to a user account exists and isn't a soft-deleted mailbox.

  ```
  $dbs = Get-MailboxDatabase
  $dbs | foreach {Get-MailboxStatistics -Database $_.DistinguishedName} | where {$_.DisplayName -eq "
  <DisplayName>"} | Format-List DisplayName,Database,DisconnectReason
  ```

  To be able to connect a disabled mailbox, the mailbox has to exist in the mailbox database and the value for the *DisconnectReason* property has to be `Disabled`. If the mailbox has been purged from the database, the command won't return any results.

- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

TIP

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the EAC to connect a disabled mailbox

The following procedure shows how to connect a disabled user mailbox. You can also reconnect disabled linked mailboxes and disabled shared mailboxes to the corresponding user account.

1. In the EAC, navigate to **Recipients** > **Mailboxes**.
2. Click **More** •••, and then click **Connect a mailbox**.

   A list of mailboxes that are disconnected on the selected Exchange server in your Exchange organization will be displayed.

   > **NOTE**
   >
   > This list of disconnected mailboxes includes disabled mailboxes, deleted mailboxes, and soft-deleted mailboxes.

3. Click the disabled mailbox that you want to reconnect, and then click **Connect**.
4. In the window that asks if you're sure that you want to reconnect the mailbox, click **Yes**.

   Exchange will reconnect the disabled mailbox to the corresponding user account.

Use the Exchange Management Shell to connect a disabled mailbox or personal archive

Use the **Connect-Mailbox** cmdlet in the Exchange Management Shell to connect a user account to a disabled mailbox. You have to specify the type of mailbox that you're connecting. The following examples show the syntax for reconnecting user, linked, shared, and archive mailboxes.

This example connects a user mailbox. The *Identity* parameter specifies the disconnected mailbox in the Exchange database. The *User* parameter specifies the Active Directory user account to reconnect the mailbox to.

```
Connect-Mailbox -Identity "Jeffrey Zeng" -Database MBXDB01 -User "Jeffrey Zeng"
```

This example connects a linked mailbox. The *Identity* parameter specifies the disconnected mailbox in the Exchange database. The *LinkedMasterAccount* parameter specifies the Active Directory user account in the account forest that you want to reconnect the mailbox to. The *Alias* parameter specifies the alias, which is the portion of the email address on the left side of the at (@) symbol, for the reconnected mailbox.

```
Connect-Mailbox -Identity "Kai Axford" -Database MBXDB02 -LinkedDomainController FabrikamDC01 -
LinkedMasterAccount kai.axford@fabrikam.com -Alias kaia
```

This example connects a shared mailbox.

```
Connect-Mailbox -Identity "Corporate Shared Mailbox" -Database "Mailbox Database 03" -User "Corporate Shared
Mailbox" -Alias corpshared -Shared
```

> **NOTE**
>
> If you don't include the *Alias* parameter when you run the **Connect-Mailbox** cmdlet, the value specified in the *User* or *LinkedMasterAccount* parameter is used to create the email address alias for the reconnected mailbox.

This example connects a personal archive to the primary mailbox using the mailbox GUID stored in mailbox database DB01.

```
Connect-Mailbox -Identity "95352f8b-e5aa-496f-ac7f-ce93357d7b0c" -Archive -User "Megan Bown" -Database "DB01"
```

If you do not know the name of the personal archive, you can view it in the Exchange Management Shell by running the following command. This example returns all personal archive mailboxes in mailbox database DB01.

```
Get-MailboxDatabase "DB01" | Get-MailboxStatistics | Where {($_.DisconnectDate -ne $null) -and
($_.IsArchiveMailbox -eq $true)} | Format-Table DisplayName,MailboxGuid -AutoSize
```

> **NOTE**
>
> You can connect a personal archive mailbox to any primary mailbox you wish, even if it is not the original owner's mailbox. Use the *AllowLegacyDNMismatch* parameter to allow the connection of the archive mailbox to a different primary mailbox.

For detailed syntax and parameter information, see Connect-Mailbox.

How do you know this worked?

To verify that you've successfully connected a disabled mailbox to a user account, do one of the following:

- In the EAC, click **Recipients**, navigate to the appropriate page for the mailbox type that you reconnected, click **Refresh** ⟳, and verify that the mailbox is listed.

- In Active Directory Users and Computers, right-click the user account whose mailbox you disabled, and then click **Properties**. On the **General** tab, notice that the **E-mail** box is populated with the email address for the reconnected mailbox.

- In theExchange Management Shell,replace <Identity> with the name of the user account and run the following command:

  ```
  Get-User "<Identity>"
  ```

  The **UserMailbox** value for the *RecipientType* property indicates that the user account and the mailbox are connected. You can also run the **Get-Mailbox** cmdlet to verify that the mailbox exists.

Connect or restore a deleted mailbox

8/3/2020 • 7 minutes to read • Edit Online

When you delete a mailbox, Exchange retains the mailbox in the mailbox database and switches the mailbox to a disabled state. The associated Active Directory user account is also deleted. The mailbox is retained until the deleted mailbox retention period expires, which is 30 days by default, and then it's permanently deleted (or *purged*) from the mailbox database.

Until a deleted mailbox is permanently deleted from the Exchange mailbox database, you can use the EAC or the Exchange Management Shell to connect it to an Active Directory user account. You can also use the Exchange Management Shell to restore the contents of the deleted mailbox to an existing mailbox.

To learn more about disconnected mailboxes and perform other related management tasks, see the following topics:

- Disconnected mailboxes
- Disable or delete a mailbox in Exchange Server
- Connect a disabled mailbox
- Permanently delete a mailbox

What do you need to know before you begin?

- Estimated time to complete: 2 minutes.
- To open the EAC, see Exchange admin center in Exchange Server. To open the Exchange Management Shell, see Open the Exchange Management Shell.
- Create a new user account in Active Directory to connect the deleted mailbox to. Or use the **Get-User** cmdlet in the Exchange Management Shell to verify that the Active Directory user account that you want to connect the deleted mailbox to exists and that it isn't already associated with another mailbox. To connect a deleted mailbox to a user account, the account must exist and the value for the *RecipientType* property has to be `User`, which indicates that the account isn't already mailbox-enabled.

  For on-premises Exchange organizations, you can also verify this information in Active Directory Users and Computers.

  > **IMPORTANT**
  > When you connect deleted linked mailboxes, resource mailboxes, or shared mailboxes, the Active Directory user account that you're connecting the mailbox to must be disabled.

- To verify that the deleted mailbox that you want to connect a user account to exists in the mailbox database and isn't a soft-deleted mailbox, run the following command:

  ```
  Get-MailboxDatabase | foreach {Get-MailboxStatistics -Database $_.name} | where {$_.DisplayName -eq "
  <display name>"} | Format-List DisplayName,Database,DisconnectReason
  ```

  The deleted mailbox has to exist in the mailbox database and the value for the *DisconnectReason* property has to be `Disabled`. If the mailbox has been purged from the database, the command won't return any results.

- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.
- Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Connect a deleted mailbox

When you connect a deleted mailbox, you associate the mailbox with a user account that isn't mail-enabled, which means that it doesn't have an existing mailbox. To connect a deleted mailbox to a user account that has a mailbox, you have to restore the deleted mailbox. For more information, see Restore a deleted mailbox later in this topic.

Use the EAC to connect a deleted mailbox

The following procedure shows how to connect a deleted user mailbox to a user account. You can also use this procedure to connect linked mailboxes, resource mailboxes, and shared mailboxes that have been deleted to a user account.

1. In the EAC, go to **Recipients** > **Mailboxes**.
2. Click **More** •••, and then click **Connect a mailbox**.

   A list of mailboxes that are disconnected on the selected Exchange server in your Exchange organization will be displayed.

   > **NOTE**
   >
   > This list of disconnected mailboxes includes disabled mailboxes, deleted mailboxes, and soft-deleted mailboxes.

3. Click the deleted mailbox that you want to connect a user to, and then click **Connect**.
4. In the window that asks if you're sure that you want to connect the mailbox, click **Yes**.

   A list of user accounts that aren't mail-enabled is displayed.

5. Click the user that you want to connect the deleted mailbox to, and then click **OK**.

   Exchange will connect the deleted mailbox to the user account that you selected.

Use the Exchange Management Shell to connect a deleted mailbox

Use the **Connect-Mailbox** cmdlet in the Exchange Management Shell to connect a deleted mailbox to a user account that isn't mail enabled. You have to specify the type of mailbox that you're connecting. The following examples show the syntax for reconnecting user, linked, room, equipment, and shared mailboxes. In all examples, the optional *Alias* parameter is used to specify the email alias, which is the portion of the email address on the left side of the at (@) symbol. If you don't include the *Alias* parameter, the value specified in the *User* or *LinkedMasterAccount* parameter is used to create the alias for the email address for the reconnected mailbox.

> **NOTE**
>
> As previously stated, when you connect linked, resource, or shared mailboxes, the Active Directory user account that you're linking the mailbox to must be disabled.

This example connects a deleted user mailbox to a user account that isn't mail enabled. The *Identity* parameter specifies the display name of the deleted mailbox retained in the mailbox database named MBXDB01. The *User* parameter specifies the Active Directory user account to connect the mailbox to.

```
Connect-Mailbox -Identity "Paul Cannon" -Database MBXDB01 -User "Robin Wood" -Alias robinw
```

> **NOTE**
>
> You can also use the values for the `LegacyDN` or `MailboxGuid` properties to identify the deleted mailbox.

This example connects a linked mailbox. The *Identity* parameter specifies the deleted mailbox on the mailbox database named MBXDB02. The *LinkedMasterAccount* parameter specifies the Active Directory user account in the account forest that you want to connect the mailbox to. The *LinkedDomainController* parameter specifies a domain controller in the account forest.

```
Connect-Mailbox -Identity "Temp User" -Database MBXDB02 -LinkedDomainController FabrikamDC01 -
LinkedMasterAccount danpark@fabrikam.com -Alias dpark
```

This example connects a room mailbox.

```
Connect-Mailbox -Identity "rm2121" -Database "MBXResourceDB" -User "Conference Room 2121" -Alias ConfRm2121 -
Room
```

This example connects an equipment mailbox.

```
Connect-Mailbox -Identity "MotorPool01" -Database "MBXResourceDB" -User "Van01 (12 passengers)" -Alias van01
-Equipment
```

This example connects a shared mailbox.

```
Connect-Mailbox -Identity "Printer Support" -Database MBXDB01 -User "Corp Printer Support" -Alias corpprint -
Shared
```

> **NOTE**
>
> You can also use the `LegacyDN` or `MailboxGuid` values to identify the deleted mailbox.

For detailed syntax and parameter information, see Connect-Mailbox.

How do you know this worked?

To verify that you've successfully connected a deleted mailbox to a user account, do one of the following steps:

- In the EAC, click **Recipients**, go to the appropriate page for the mailbox type that you connected, click **Refresh** ↻, and verify that the mailbox is listed.

- In Active Directory Users and Computers, right-click the user account that you connected to the mailbox, and then click **Properties**. On the **General** tab, notice that the **E-mail** box is populated with the email address for the connected mailbox.

- In the Exchange Management Shell, run the following command.

```
Get-User <identity>
```

The **UserMailbox** value for the *RecipientType* property indicates that the user account and the mailbox are connected. You can also run the **Get-Mailbox <identity>** command to verify that the mailbox was connected.

Restore a deleted mailbox

You can use the Exchange Management Shell to restore a deleted mailbox to an existing mailbox using the **New-MailboxRestoreRequest** cmdlet. When you restore a deleted mailbox, its contents are copied to an existing mailbox, which is referred to as the *target mailbox*. After a deleted mailbox is restored, it's still retained in the mailbox database until it's permanently deleted by an administrator or purged after the deleted mailbox retention period expires.

After a mailbox restore request is successfully completed, it's retained for 30 days, by default, before it's removed. You can remove the mailbox sooner by using the **Remove-StoreMailbox** cmdlet.

> **NOTE**
>
> You can't use the EAC to restore a deleted mailbox.

Use the Exchange Management Shell to restore a deleted mailbox

To create a mailbox restore request, you have to use the display name, legacy distinguished name (DN), or mailbox GUID of the deleted mailbox. Use the **Get-MailboxStatistics** cmdlet to display the values of the `DisplayName`, `MailboxGuid`, and `LegacyDN` properties for the deleted mailbox that you want to restore. For example, run the following commands to return this information for all disabled and deleted mailboxes in your organization.

```
$dbs = Get-MailboxDatabase
$dbs | foreach {Get-MailboxStatistics -Database $_.DistinguishedName} | where {$_.DisconnectReason -eq
"Disabled"} | Format-Table DisplayName,MailboxGuid,Database,DisconnectDate
```

This example restores the deleted mailbox, which is identified by the *SourceStoreMailbox* parameter and is located on the MBXDB01 mailbox database, to the target mailbox Debra Garcia. The *AllowLegacyDNMismatch* parameter is used so the source mailbox can be restored to a different mailbox, one that doesn't have the same legacy DN value.

```
New-MailboxRestoreRequest -SourceStoreMailbox e4890ee7-79a2-4f94-9569-91e61eac372b -SourceDatabase MBXDB01 -
TargetMailbox "Debra Garcia" -AllowLegacyDNMismatch
```

This example restores Pilar Pinilla's deleted archive mailbox to her current archive mailbox. The *AllowLegacyDNMismatch* parameter isn't necessary because a primary mailbox and its corresponding archive mailbox have the same legacy DN.

```
New-MailboxRestoreRequest -SourceStoreMailbox "Personal Archive - Pilar Pinilla" -SourceDatabase "MDB01" -
TargetMailbox pilarp@contoso.com -TargetIsArchive
```

For detailed syntax and parameter information, see New-MailboxRestoreRequest.

How do you know this worked?

To verify that you've successfully restored a deleted mailbox to the target mailbox, run the **Get-**

MailboxRestoreRequest cmdlet to display information about the restore request. If the restore request was successfully created, the *Status* property will have a value of `Queued`, `InProgress`, or `Completed`. After the restore request is completed, the contents from the deleted mailbox will appear in the target mailbox.

For more information, see:

- Manage Mailbox Restore Requests
- Get-MailboxRestoreRequest
- Get-MailboxRestoreRequestStatistics

Permanently delete a mailbox

8/3/2020 • 3 minutes to read • Edit Online

When you permanently delete active mailboxes and disconnected mailboxes, all mailbox contents are purged from the Exchange mailbox database, and the data loss is permanent. When you permanently delete an active mailbox, the associated Active Directory user account is also deleted.

An alternative to permanently deleting a mailbox is to disconnect it. After you disconnect a mailbox, by default, Exchange retains the data in the mailbox database for 30 days. This gives you the opportunity to reconnect or restore a mailbox before it's purged from the database.

To learn more about disconnected mailboxes and perform other related management tasks in Exchange, see the following topics:

- Disconnected mailboxes
- Disable or delete a mailbox in Exchange Server
- Connect a disabled mailbox
- Connect or restore a deleted mailbox

> **NOTE**
>
> You can't use the Exchange admin center (EAC) to permanently delete an active mailbox or a disconnected mailbox.

What do you need to know before you begin?

- Estimated time to complete: 2 minutes.
- The procedures in this topic require the Exchange Management Shell. For more information, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.

Use the Exchange Management Shell to permanently delete an active mailbox

If you don't include the *Permanent* parameter when you delete a mailbox, the deleted mailbox is retained in the mailbox database for 30 days (by default) before it's permanently deleted.

Run the following command to permanently delete an active mailbox and the associated Active Directory user account:

```
Remove-Mailbox -Identity <Identity> -Permanent $true
```

For detailed syntax and parameter information, see Remove-Mailbox.

How do you know this worked?

To verify that you've permanently deleted an active mailbox, do the following:

1. Verify that the mailbox is no longer listed in the Exchange admin center (EAC).

2. Verify that the associated user account is no longer listed in Active Directory Users and Computers.

3. Replace *<DisplayName>* with the display name of the mailbox and run the following commands in the Exchange Management Shell to verify that the mailbox was successfully purged from the Exchange mailbox database:

   ```
   $dbs = Get-MailboxDatabase
   $dbs | foreach {Get-MailboxStatistics -Database $_.DistinguishedName} | where {$_.DisplayName -eq "
   <DisplayName>"}
   ```

   If you successfully purged the mailbox, the command won't return any results. If the mailbox wasn't purged, the command will return information about the mailbox.

Use the Exchange Management Shell to find the disconnected mailbox type

A disconnected mailbox can be either disabled or soft-deleted. You need to specify the correct type to permanently delete a disconnected mailbox. If you don't, the command will fail.

Replace *<DisplayName>* with the display name of the mailbox and run the following command to determine whether a disconnected mailbox is disabled or soft-deleted:

```
$dbs = Get-MailboxDatabase
$dbs | foreach {Get-MailboxStatistics -Database $_.DistinguishedName} | where {$_.DisplayName -eq "
<DisplayName>"} | Format-List DisplayName,MailboxGuid,Database,DisconnectReason
```

The value for the *DisconnectReason* property will be either `Disabled` or `SoftDeleted`.

You can run the following commands to display the type for all disconnected mailboxes in your organization:

```
$dbs = Get-MailboxDatabase
$dbs | foreach {Get-MailboxStatistics -Database $_.DistinguishedName} | where {$_.DisconnectReason -ne $null}
| Format-List DisplayName,MailboxGuid,Database,DisconnectReason
```

Use the Exchange Management Shell to permanently delete a disconnected mailbox

Caution

When you use the **Remove-StoreMailbox** cmdlet to permanently delete a disconnected mailbox, all its contents are purged from the mailbox database and the data loss is permanent.

This example permanently deletes the disabled mailbox with the GUID 2ab32ce3-fae1-4402-9489-c67e3ae173d3 from mailbox database named MBD01.

```
Remove-StoreMailbox -Database MBD01 -Identity "2ab32ce3-fae1-4402-9489-c67e3ae173d3" -MailboxState Disabled
```

This example permanently deletes the soft-deleted mailbox for Dan Jump from mailbox database named MBD01.

```
Remove-StoreMailbox -Database MBD01 -Identity "Dan Jump" -MailboxState SoftDeleted
```

This example permanently deletes all soft-deleted mailboxes from mailbox database named MBD01.

```
Get-MailboxStatistics -Database MBD01 | where {$_.DisconnectReason -eq "SoftDeleted"} | ForEach {Remove-
StoreMailbox -Database $_.Database -Identity $_.MailboxGuid -MailboxState SoftDeleted}
```

For detailed syntax and parameter information, see Remove-StoreMailbox and Get-MailboxStatistics.

How do you know this worked?

To verify that you've permanently deleted a disconnected mailbox and that it was successfully purged from the mailbox database, replace *<DisplayName>* with the display name of the mailbox and run the following command:

```
$dbs = Get-MailboxDatabase
$dbs | foreach {Get-MailboxStatistics -Database $_.DistinguishedName} | where {$_.DisplayName -eq "
<DisplayName>"}
```

If you successfully purged the mailbox, the command won't return any results. If the mailbox wasn't purged, the command will return information about the mailbox.

Custom attributes

8/3/2020 • 3 minutes to read • Edit Online

Exchange Server includes 15 extension attributes that you can use to add information about a recipient, such as an employee ID, organizational unit (OU), or some other custom value for which there isn't an existing attribute.

In earlier versions of Exchange, if you wanted to store this information in Active Directory, you had to create an attribute by extending the Active Directory schema. Schema extension requires planning, procuring object identifiers (OIDs) for new attributes, and testing the extension process in a test environment before you implement it in a production environment. Exchange Server doesn't let you use schema extensions in recipient filters that are used by address lists, e-mail address policies, and dynamic distribution groups.

The custom attributes available to Exchange Server are labeled in Active Directory as **ms-Exch-Extension-Attribute1** through **ms-Exch-Extension-Attribute15**. In the Exchange Management Shell, the corresponding parameters are *CustomAttribute1* through *CustomAttribute15*. These attributes aren't used by any Exchange components. They can be used to store Active Directory data without having to extend the Active Directory schema.

> **NOTE**
>
> **ms-Exch-Extension-Attribute-16** to **ms-Exch-Extension-Attribute-45** are present in Active Directory, but aren't available in the Exchange admin center (EAC) or the Exchange Management Shell. Don't use non-Exchange tools to edit these attributes because they might be used for future Exchange features.

Advantages of custom attributes

There are several advantages to using custom attributes:

- You avoid extending the Active Directory schema.
- You don't have to do the work, because the attributes are created by Exchange Setup.
- You can use the EAC or the Exchange Management Shell to manage the attributes. You don't need to build custom controls or write scripts to populate and display these attributes.
- You can filter and reuse the attributes, as attributes are filterable properties that can be used in the *Filter* parameter with recipient cmdlets such as **Get-Mailbox**. They can also be used in the EAC and the Exchange Management Shell to create filters for e-mail address policies, address lists, and dynamic distribution groups.

Multivalued custom attributes

Starting with Exchange 2010 Service Pack 2 (SP2), five multivalued custom attributes were added to Exchange to allow you to store additional information for mail recipients if the traditional custom attributes didn't meet your needs. The *ExtensionCustomAttribute1* to *ExtensionCustomAttribute5* parameters can hold up to 1,300 values each. You can specify multiple values as a comma-delimited list. The following cmdlets support these new parameters:

- Set-DistributionGroup
- Set-DynamicDistributionGroup
- Set-Mailbox
- Set-MailContact

- Set-MailPublicFolder
- Set-RemoteMailbox

For more information about multivalued properties, see Modifying multivalued properties.

Custom attribute examples

A common scenario in many Exchange deployments is that of creating an e-mail address policy for all recipients in an OU. The OU isn't a filterable property that can be used in the *RecipientFilter* parameter of an e-mail address policy or an address list.

> **NOTE**
>
> Dynamic distribution groups have an additional parameter that you can use to restrict it to recipients in a particular OU or container.

If the recipients in a particular OU don't share any common properties that you can filter by, such as department or location, you can populate one of the custom attributes with a common value, as shown in this example.

```
Get-Mailbox -OrganizationalUnit Sales | Set-Mailbox CustomAttribute1 "SalesOU"
```

With that done, now you can create an e-mail address policy for all recipients that have the *CustomAttribute1* property that equals SalesOU, as shown in this example.

```
New-EmailAddressPolicy -Name "Sales" -RecipientFilter "CustomAttribute1 -eq 'SalesOU'" -
EnabledEmailAddressTemplates "SMTP:%s%2g@sales.contoso.com"
```

Custom attribute example using the ConditionalCustomAttributes parameter

When creating dynamic distribution groups, email address policies, or address lists, you don't need to use the *RecipeintFilter* parameter to specify custom attributes. You can use the *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters instead.

This example creates a dynamic distribution group based on the recipients whose *CustomAttribute1* is set to SalesOU.

```
New-DynamicDistributionGroup -Name "Sales Users and Contacts" -IncludedRecipients "MailboxUsers,MailContacts"
-ConditionalCustomAttribute1 "SalesOU"
```

> **NOTE**
>
> You need to use the *IncludedRecipients* parameter if you use a *Conditional* parameter. In addition, you can't use *Conditional* parameters if you use the *RecipientFilter* parameter. If you want to include additional filters to create your dynamic distribution group, email address policies, or address lists, you should use the *RecipientFilter* parameter.

Custom attribute example using ExtensionCustomAttributes parameter

In this example, the mailbox for Kweku will have *ExtensionCustomAttribute1* updated to reflect that he's enrolled in the following educational classes: MATH307, ECON202, and ENGL300.

```
Set-Mailbox -Identity Kweku -ExtensionCustomAttribute1 MATH307,ECON202,ENGL300
```

Next, a dynamic distribution group for all students enrolled MATH307 is created by using the *RecipientFilter* parameter where *ExtensionCustomAttribute1* is equal to MATH307. When using the *ExtentionCustomAttributes* parameters, you can use the `-eq` operator instead of the `-like` operator.

```
New-DynamicDistributionGroup -Name Students_MATH307 -RecipientFilter "ExtensionCustomAttribute1 -eq 'MATH307'"
```

In this example, Kweku's *ExtensionCustomAttribute1* values are updated to reflect that he's added the class ENGL210 and removed the class ECON202.

```
Set-Mailbox -Identity Kweku -ExtensionCustomAttribute1 @{Add="ENGL210"; Remove="ECON202"}
```

Manage permissions for recipients

8/3/2020 • 11 minutes to read • Edit Online

In Exchange Server, you can use the Exchange admin center (EAC) or the Exchange Management Shell to assign permissions to a mailbox or group so that other users can access the mailbox (the Full Access permission), or send email messages that appear to come from the mailbox or group (the Send As or Send on Behalf permissions). The users that are assigned these permissions on other mailboxes or groups are called *delegates*.

The permissions that you can assign to delegates for mailboxes and groups in Exchange Server are described in the following table:

Note: Although you can use the Exchange Management Shell to assign some or all of these permissions to other delegate types on other kinds of recipient objects, this topic focuses on the delegate and recipient object types that produce useful results.

PERMISSION	DESCRIPTION	RECIPIENT TYPES IN THE EAC	ADDITIONAL RECIPIENT TYPES IN POWERSHELL	DELEGATE TYPES IN THE EAC	ADDITIONAL DELEGATE TYPES IN THE POWERSHELL
Full Access	Allows the delegate to open the mailbox, and view, add and remove the contents of the mailbox. Doesn't allow the delegate to send messages from the mailbox. If you assign the Full Access permission to a mailbox that's hidden from address lists, the delegate won't be able to open the mailbox. By default, arbitration and discovery mailboxes are hidden from address lists. By default, the mailbox auto-mapping feature uses Autodiscover to automatically open the mailbox in the delegate's Outlook profile (in addition to their own	User mailboxes Linked mailboxes Resource mailboxes Shared mailboxes	Arbitration mailboxes Discovery mailboxes	Mailboxes with user accounts Mail users with accounts Mail-enabled security groups	User accounts that aren't mail-enabled. Universal, global, and domain local security groups that aren't mail-enabled.

PERMISSION	DESCRIPTION	RECIPIENT TYPES IN THE EAC	ADDITIONAL RECIPIENT TYPES IN POWERSHELL	DELEGATE TYPES IN THE EAC	ADDITIONAL DELEGATE TYPES IN THE POWERSHELL
	their own mailbox). Note that auto-mapping will only work for individual users granted the proper permissions and will not work for any kind of group. If you don't want mailboxes to be auto-mapped, you need to take one of the following actions: • Use the **Add-MailboxPermission** cmdlet in the Exchange Management Shell to assign the Full Access permission with the `-AutoMapping $false` setting. For more information, see the Use the Exchange Management Shell to assign the Full Access permission to mailboxes section in this topic. • Assign the Full Access permission to a (mail-enabled) security group. The mailbox won't open in the Outlook profile of each member.				

PERMISSION	DESCRIPTION	RECIPIENT TYPES IN THE EAC	ADDITIONAL RECIPIENT TYPES IN POWERSHELL	DELEGATE TYPES IN THE EAC	ADDITIONAL DELEGATE TYPES IN THE POWERSHELL
Send As	Allows the delegate to send messages as if they came directly from the mailbox or group. There's no indication that the message was sent by the delegate. Doesn't allow the delegate to read the contents of the mailbox. If you assign the Send As permission to a mailbox that's hidden from address lists, the delegate won't be able to send messages from the mailbox.	User mailboxes Linked mailboxes Resource mailboxes Shared mailboxes Distribution groups Dynamic distribution groups Mail-enabled security groups	n/a	Mailboxes with user accounts Mail users with accounts Mail-enabled security groups	n/a

PERMISSION	DESCRIPTION	RECIPIENT TYPES IN THE EAC	ADDITIONAL RECIPIENT TYPES IN POWERSHELL	DELEGATE TYPES IN THE EAC	ADDITIONAL DELEGATE TYPES IN THE POWERSHELL
Send on Behalf	Allows the delegate to send messages from the mailbox or group. The From address of these messages clearly shows that the message was sent by the delegate ("*<Delegate>* on behalf of *<MailboxOrGroup>*"). However, replies to these messages are sent to the mailbox or group, not to the delegate. Doesn't allow the delegate to read the contents of the mailbox. If you assign the Send on Behalf permission to a mailbox that's hidden from address lists, the delegate won't be able to send messages from the mailbox.	User mailboxes Linked mailboxes Resource mailboxes Distribution groups Dynamic distribution groups Mail-enabled security groups	Shared mailboxes	Mailboxes with user accounts Mail users with accounts Mail-enabled security groups Distribution groups	n/a

NOTE

If a user has both Send As and Send on Behalf permissions to a mailbox or group, the Send As permission is always used.|User mailboxes

What do you need to know before you begin?

- Estimated time to complete each procedure: 2 minutes.
- You need to be assigned permissions before you can perform the procedures in this topic. To see what permissions you need, see the "Recipient provisioning permissions" entry in the Recipients Permissions topic.
- To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.
- Procedures in this topic require specific permissions. See each procedure for its permissions information.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

TIP

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

Use the EAC to assign permissions to individual mailboxes

1. In the EAC, click **Recipients** in the feature pane. Depending on the type of mailbox that you want to assign permissions for, click on one of the following tabs:

   - **Mailboxes**: User or linked mailboxes.

   - **Resources**: Room or equipment mailboxes.

   - **Shared**: Shared mailboxes.

2. In the list of mailboxes, select the mailbox that you want to assign permissions for, and then click **Edit** ✎.

3. On the mailbox properties page that opens, click **Mailbox delegation** and configure one or more of the following permissions:

   - **Send As**: Messages sent by a delegate appear to come from the mailbox.

   - **Send on Behalf**: Messages sent by a delegate have " *<Delegate>* on behalf of *<Mailbox>*" in the From address. Note that this permission isn't available in the EAC for shared mailboxes.

   - **Full Access**: The delegate can open the mailbox and do anything except send messages.

   To assign permissions to delegates, click **Add** + under the appropriate permission. A dialog box appears that lists the users or groups that can have the permission assigned to them. Select the user or group from the list, and then click **Add**. Repeat this process as many times as necessary. You can also search for users or groups in the search box by typing all or part of the name, and then clicking **Search** 🔍. When you're finished selecting delegates, click **OK**.

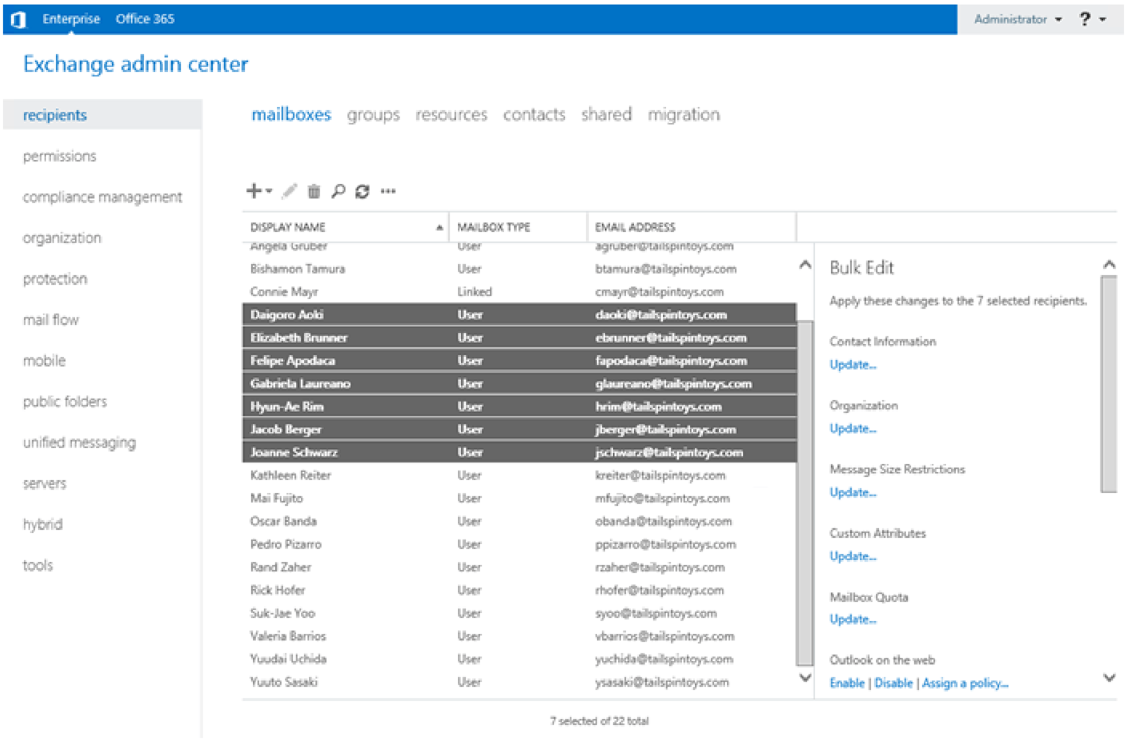
   To remove a permission from a delegate, select the delegate in the list under the appropriate permission, and then click **Remove** −.

4. When you're finished, click **Save**.

Use the EAC to assign permissions to multiple mailboxes at the same time

1. In the EAC, navigate to **Recipients** > **Mailboxes**.

2. Select the mailboxes that you want to assign permissions for. Use click + Shift key + click to select a range of mailboxes, or Ctrl key + click to select multiple individual mailboxes. The title of the details pane changes to **Bulk Edit** as shown in the following diagram.



DISPLAY NAME	MAILBOX TYPE	EMAIL ADDRESS
Angela Gruber	User	agruber@tailspintoys.com
Bishamon Tamura	User	btamura@tailspintoys.com
Connie Mayr	Linked	cmayr@tailspintoys.com

Enable | Disable | Assign a policy...

Note that the mailboxes that you select need to be the same type. For example, if you select both user mailboxes and linked mailboxes, you'll get a warning in the details pane that says bulk edit won't work.

3. At the bottom of the details pane, click **More options**. Under the **Mailbox Delegation** option that appears, choose **Add** or **Remove**. Depending on your selection, do one of the following steps:

   - **Add**: In the **Bulk Add Delegation** dialog box that appears, click **Add** ✚ under the appropriate permission (**Send As**, **Send on Behalf**, or **Full Access**). When you're finished selecting users or groups to add as delegates, click **Save**.

   - **Remove**: In the **Bulk Remove Delegation** dialog box that appears, click **Add** ✚ under the appropriate permission (**Send As**, **Send on Behalf**, or **Full Access**). When you're finished selecting users or groups to remove from the existing delegates, click **Save**.

Use the EAC to assign permissions to groups

1. In the EAC, navigate to **Recipients** > **Groups**.

2. In the list of groups, select the group that you want to assign permissions for, and then click **Edit** ✎.

3. On the group properties page that opens, click **Group delegation** and configure one of the following permissions:

   - **Send As**: Messages sent by a delegate appear to come from the group.

   - **Send on Behalf**: Messages sent by a delegate have " *<Delegate>* on behalf of *<Group>*" in the From address.

4. To assign permissions to delegates, click **Add** ✚ under the appropriate permission. A dialog box appears that lists the users or groups that can have the permission assigned to them. Select the user or group from the list, and then click **Add**. Repeat this process as many times as necessary. You can also search for users or groups in the search box by typing all or part of the name, and then clicking **Search** 🔍. When you're finished selecting delegates, click **OK**.

   To remove a permission from a delegate, select the delegate in the list under the appropriate permission, and then click **Remove** ━.

5. When you're finished, click **Save**.

Use the Exchange Management Shell to assign the Full Access permission to mailboxes

You use the **Add-MailboxPermission** and **Remove-MailboxPermission** cmdlets to manage the Full Access permission for mailboxes. These cmdlets use the same basic syntax:

```
Add-MailboxPermission -Identity <MailboxIdentity> -User <DelegateIdentity> -AccessRights FullAccess -
InheritanceType All [-AutoMapping $false]
```

For more information, see Add-MailboxPermission.

```
Remove-MailboxPermission -Identity <MailboxIdentity> -User <DelegateIdentity> -AccessRights FullAccess -
InheritanceType All
```

For more information, see Remove-MailboxPermission.

This example assigns the delegate Raymond Sam the Full Access permission to the mailbox of Terry Adams.

```
Add-MailboxPermission -Identity "Terry Adams" -User raymonds -AccessRights FullAccess -InheritanceType All
```

This example assigns Esther Valle the Full Access permission to the organization's default discovery search mailbox, and prevents the mailbox from automatically opening in Esther Valle's Outlook.

```
Add-MailboxPermission -Identity "DiscoverySearchMailbox{D919BA05-46A6-415f-80AD-7E09334BB852}" -User estherv -
AccessRights FullAccess -InheritanceType All -AutoMapping $false
```

This example assigns members of the Helpdesk mail-enabled security group the Full Access permission to the shared mailbox named Helpdesk Tickets.

```
Add-MailboxPermission -Identity "Helpdesk Tickets" -User Helpdesk -AccessRights FullAccess -InheritanceType
All
```

This example removes Full Access permission for Jim Hance from Ayla Kol's mailbox.

```
Remove-MailboxPermission -Identity ayla -User "Jim Hance" -AccessRights FullAccess -InheritanceType All
```

How do you know this worked?

To verify that you've successfully assigned or removed the Full Access permission for a delegate on a mailbox, use either of the following procedures:

- In the properties of the mailbox in the EAC, verify the delegate is or isn't listed in **Mailbox delegation** > **Full Access**.

- Replace *<MailboxIdentity>* with the identity of the mailbox and run the following command in the Exchange Management Shell to verify that the delegate is or isn't listed..

  ```
  Get-MailboxPermission <MailboxIdentity> | where {$_.AccessRights -like 'Full*'} | Format-Table -Auto
  User,Deny,IsInherited,AccessRights
  ```

For more information, see Get-MailboxPermission.

Use the Exchange Management Shell to assign the Send As permission to mailboxes and groups

You use the **Add-AdPermission** and **Remove-AdPermission** cmdlets to manage the Send As permission for mailboxes. These cmdlets use the same basic syntax:

```
<Add-AdPermission | Remove-AdPermission> -Identity <MailboxOrGroupNameOrDN> -User <DelegateIdentity> [-
AccessRights ExtendedRight] -ExtendedRights "Send As"
```

For more information, see Add-AdPermission and Remove-AdPermission.

Notes:

- The *Identity* parameter requires you to use the **Name** or **DistinguishedName** (DN) value of the mailbox or group.
  - **Name**: This value may or may not be the same as the display name. For example, `Felipe Apodaca`.
  - **DistinguishedName**: This value always contains the **Name** value and uses Active Directory LDAP syntax. For example, `CN=Felipe Apodaca,CN=Users,DC=contoso,DC=com`.

  To find these values for a mailbox or group, you can use the **Get-Recipient** cmdlet, which accepts many different values for the *Identity* parameter. For example:

  ```
  Get-Recipient -Identity helpdesk@contoso.com | Format-List Name,DistinguishedName
  ```

- The commands work with or without `-AccessRights ExtendedRight`, which is why it's shown as optional in the syntax.

This example assigns the Send As permission to the Helpdesk mail-enabled security group on the shared mailbox named Helpdesk Support Team.

```
Add-ADPermission -Identity "Helpdesk Support Team" -User Helpdesk -ExtendedRights "Send As"
```

This example removes the Send As permission for the user Pilar Pinilla on the mailbox of James Alvord.

```
Remove-ADPermission -Identity "James Alvord" -User pilarp -ExtendedRights "Send As"
```

How do you know this worked?

To verify that you've successfully assigned or removed the Send As permission for a delegate on a mailbox or group, use either of the following procedures:

- In the properties of the mailbox or group in the EAC, verify the delegate is or isn't listed in **Mailbox delegation** > **Send As** or **Group delegation** > **Send As**.
- Replace *<MailboxOrGroupNameOrDN>* with the name or distinguished name of the mailbox or group and run the following command in the Exchange Management Shell to verify that the delegate is or isn't listed.

  ```
  Get-ADPermission -Identity <MailboxOrGroupNameOrDN> | where {$_.ExtendedRights -like 'Send*'} | Format-
  Table -Auto User,Deny,ExtendedRights
  ```

For more information, see Get-AdPermission.

Use the Exchange Management Shell to assign the Send on Behalf permission to mailboxes and groups

You use the *GrantSendOnBehalfTo* parameter on the various mailbox and group **Set-** cmdlets to manage the Send on Behalf permission for mailboxes and groups:

- **Set-Mailbox**
- **Set-DistributionGroup**: Distribution groups and mail-enabled security groups.
- **Set-DynamicDistributionGroup**

The basic syntax for these cmdlets is:

```
<Cmdlet> -Identity <MailboxOrGroupIdentity> -GrantSendOnBehalfTo <Delegates>
```

The *GrantSendOnBehalfTo* parameter has the following options for delegate values:

- **Replace existing delegates**: `<DelegateIdentity>` or `"<DelegateIdentity1>","<DelegateIdentity2>",...`
- **Add or remove delegates without affecting other delegates**: `@{Add="\<value1\>","\<value2\>"...; Remove="\<value1\>","\<value2\>"...}`
- **Remove all delegates**: Use the value `$null`.

This example assigns the delegate Holly Holt the Send on Behalf permission to the mailbox of Sean Chai.

```
Set-Mailbox -Identity seanc@contoso.com -GrantSendOnBehalfTo hollyh
```

This example adds the group tempassistants@contoso.com to the list of delegates that have Send on Behalf permission to the Contoso Executives shared mailbox.

```
Set-Mailbox "Contoso Executives" -GrantSendOnBehalfTo @{Add="tempassistants@contoso.com"}
```

This example assigns the delegate Sara Davis the Send on Behalf permission to the Printer Support distribution group.

```
Set-DistributionGroup -Identity printersupport@contoso.com -GrantSendOnBehalfTo sarad
```

This example removes the Send on Behalf permission that was assigned to the administrator on the All Employees dynamic distribution group.

```
Set-DynamicDistributionGroup "All Employees" -GrantSendOnBehalfTo @{Remove="Administrator"}
```

How do you know this worked?

To verify that you've successfully assigned or removed the Send on Behalf permission for a delegate on a mailbox or group, use either of the following procedures:

- In the properties of the mailbox or group in the EAC, verify the delegate is or isn't listed in **Mailbox delegation** > **Send As** or **Group delegation** > **Send As**.
- Replace *<MailboxIdentity>* or *<GroupIdentity>* with the identity of the mailbox or group and run the one of

the following commands in the Exchange Management Shell to verify that the delegate is or isn't listed.

- Mailbox:

  ```
  Get-Mailbox -Identity <MailboxIdentity> | Format-List GrantSendOnBehalfTo
  ```

- Group:

  ```
  Get-DistributionGroup -Identity <GroupIdentity> | Format-List GrantSendOnBehalfTo
  ```

- Dynamic distribution group:

  ```
  Get-DynamicDistributionGroup -Identity <GroupIdentity> | Format-List GrantSendOnBehalfTo
  ```

Next steps

For more information about how delegates can use the permissions that are assigned to them on mailboxes and groups, see the following topics:

- Access another person's mailbox
- Open and use a shared mailbox in Outlook for Windows
- Open and use a shared mailbox in Outlook on the web

Mailbox moves in Exchange Server

8/3/2020 • 4 minutes to read • Edit Online

You use mailbox moves to move mailboxes to, from, and within your Exchange organization. These are the basic types of mailbox moves that are available:

- **Local mailbox moves**: You move mailboxes from one mailbox database to another on Exchange servers within a single Active Directory forest. For instructions, see Manage on-premises mailbox moves in Exchange Server.
- **Cross-forest mailbox moves**: You move mailboxes to Exchange servers in a different Active Directory forest. You can initiate the move from the target forest where you want to move the mailboxes (known as a *pull* move type), or from the source forest that currently hosts the mailboxes (known as a *push* move type). For more information, see Prepare mailboxes for cross-forest move requests.
- **Remote mailbox moves in hybrid deployments**: In hybrid deployments between on-premises Exchange and Microsoft Office 365, you can move mailboxes from Exchange to Microsoft 365 or Office 365 (known as *onboarding remote move migrations*) and from Microsoft 365 or Office 365 to Exchange (know as *offboarding remote move migrations*). For more information, see Move mailboxes between on-premises and Exchange Online organizations in hybrid deployments.

NOTE

For more information about migrating on-premises Exchange organizations to Microsoft 365 or Office 365, see Ways to migrate multiple email accounts to Microsoft 365 or Office 365.

Mailbox moves in Exchange 2016 and Exchange 2019 use the batch move architecture that was introduced in Exchange 2013. The batch move architecture gives you the ability to move mailboxes in large batches. The enhanced management capabilities in the batch move architecture includes:

- Email notification during move with reporting.
- Automatic retry and automatic prioritization of moves.
- Move primary and personal archive mailboxes together or separately.
- Option for manual move request finalization to let you review your move before completion.
- Periodic incremental syncs to update migration changes.

You can move mailboxes in the Exchange admin center (EAC), or by using the New-MoveRequest or New-MigrationBatch cmdlets in the Exchange Management Shell.

Scenarios for local and cross-forest mailbox moves

These are some scenarios for local mailbox moves:

- **Upgrade**: When you upgrade from an earlier version of Exchange, you move mailboxes from the existing Exchange servers to an Exchange Mailbox server.
- **Realignment**: For example, you might want to move a mailbox to a database that has a larger mailbox size limit.
- **Investigate an issue**: If you need to investigate an issue with a mailbox, you can move that mailbox to a

different server. For example, you can move all mailboxes that have high activity to another server.

- **Corrupted mailboxes**: If you encounter corrupted mailboxes, you can move the mailboxes to a different server or database. The corrupted messages won't be moved.
- **Physical location changes**: You can move mailboxes to a server in a different Active Directory site. For example, if a user moves to a different physical location, you can move that user's mailbox to a server closer to the new location.

These are some scenarios for cross-forest mailbox moves:

- **Separation of administrative roles**: You might want to separate Exchange administration from Active Directory user account administration. To do this, you can move mailboxes from a single forest into a resource forest scenario. In this scenario, the Exchange mailboxes reside in one forest and their associated Active Directory user accounts reside in a different forest.
- **Outsourced email administration**: You might want to outsource the administration of email and retain the administration of Active Directory user accounts. To do this, you can move mailboxes from a single forest into a resource forest scenario.
- **Integrate email and user account administration**: You might want to change from a separated or outsourced email administration model to a model where email and user accounts can be managed from within the same forest. To do this, you can move mailboxes from a resource forest scenario to a single forest. In this scenario, the Exchange mailboxes and Active Directory user accounts reside in the same forest.

CSV files for mailbox moves

One of the major benefits of the batch move architecture is the ability to use a comma-separated value (CSV) to specify the mailboxes to move. The information that's required in the CSV file depends on the type of move. For more information, see CSV Files for Mailbox Migration.

Migration endpoints for cross-forest and remote mailbox moves

You use migration endpoints for cross-forest mailbox moves, and remote mailbox moves between Exchange and Microsoft 365 or Office 365 in hybrid deployments. You don't use migration endpoints for local mailbox moves.

Migration endpoints specify the remote server information, source throttling settings, and the required credentials for migrating the mailboxes.

- Cross-forest mailbox moves require an ExchangeRemoteMove migration endpoint.
- Onboarding mailbox move migrations in hybrid organizations (from Exchange to Microsoft 365 or Office 365) require an ExchangeRemoteMove migration endpoint as the *source* of the migration batch.
- Offboarding mailbox move migrations in hybrid organizations (from Microsoft 365 or Office 365 to Exchange) require an ExchangeRemoteMove migration endpoint as the *target* of the migration batch.

You can create migration endpoints in the EAC or by using the New-MigrationEndpoint cmdlet in the Exchange Management Shell.

MRS Proxy endpoints for cross-forest and remote mailbox moves

The Mailbox Replication Service Proxy (MRS Proxy) facilitates cross-forest mailbox moves and remote move migrations. By default, the Client Access services on Mailbox servers aren't configured to accept incoming move requests, so you'll need to enable the MRS Proxy endpoint.

- For cross-forest moves from the target forest (pull moves), you need to enable the MRS Proxy endpoint in the Client Access services on Mailbox servers in the source forest.

- For cross-forest moves from the source forest (push moves), you need to enable the MRS Proxy endpoint in the Client Access services on Mailbox servers in the target forest.

- For both onboarding and offboarding remote move migrations in hybrid deployments, you need to enable the MRS Proxy endpoint in the Client Access services on Mailbox servers in the on-premises Exchange organization.

For more information, see Enable the MRS Proxy endpoint for remote moves.

Mailbox imports and exports in Exchange Server

8/3/2020 • 5 minutes to read • Edit Online

Exchange Server uses the Microsoft Exchange Mailbox Replication service (MRS) to import .pst files to mailboxes, and export mailboxes to .pst files. The advantages of using MRS instead of Outlook to import and export mailboxes are:

- Import and export requests are asynchronous (you can import and export multiple .pst files at the same time).
- Imports and exports take advantage of the queuing and throttling that's provided by the MRS.
- You can import a .pst file directly to a user's archive mailbox.
- The source or destination .pst files can reside on any network share that's accessible by your Exchange servers.

This feature was introduced in Exchange 2010 Service Pack 1 (SP1). In Exchange 2010, the MRS runs on Client Access servers. In Exchange 2013 or later, the MRS runs in the backend services on Mailbox servers (not in the frontend Client Access services).

> **NOTE**
> Mailbox imports and exports are available only in the Mailbox Import Export role, and by default, that role isn't assigned to a role group. To use these features, you need to add the Mailbox Import Export role to a role group that you belong to (for example, the Organization Management role group). For more information, see Add a role to a role group.

Reasons to import or export mailboxes

As an administrator, you might need to import .pst files to mailboxes or export mailboxes to .pst files. For example:

- **Compliance requirements**: You can export a mailbox to a .pst file for legal discovery purposes. After the export is complete, you can import the .pst file to a mailbox that's specifically used for compliance purposes.
- **Create a point-in-time snapshot of a mailbox**: Suppose you're keeping a backup of an entire mailbox database for just a few mailboxes. By exporting those mailboxes to .pst files, you can eliminate the mailbox database backup.
- **Get content out of .pst files and into mailboxes**: Typically, Outlook users can save their email messages locally in .pst files. You can import users' .pst files to their primary mailboxes or archive mailboxes. This is an easy method for transferring email from a user's local computer to an Exchange server.

Considerations

Before you import .pst files to mailboxes, or export mailboxes to .pst files, consider these issues:

- You need to use a UNC network share (\ *<Server>*\ *<Share>*\ or \ *<LocalServerName>*\c$). The Exchange Trusted Subsystem security group requires permissions to the network share (Read for imports, Read/Write for exports). If the share doesn't have these permissions, you'll get errors when you try to import or export .pst files.
- We recommend that you don't try to import or export .pst files that are larger than 50 gigabytes (GB), because 50 GB is the maximum .pst file size that's supported by current versions of Outlook. You can export

mailboxes that are larger than 50 GB to .pst files by using multiple export requests that include or exclude specific folders, or by using a content filter.

- The operations may take several hours depending on the size of the .pst files or mailboxes, the available network bandwidth, and MRS throttling.
- You can't import .pst files to public folders.

Import .pst files to mailboxes

Here are some things to consider when you import .pst files to mailboxes:

- You can create new mailbox import requests in the EAC or the Exchange Management Shell. To view, modify, suspend, resume, or remove mailbox import requests, you need to use the Exchange Management Shell.
- You can import the .pst file to a different mailbox. For example, you can export data from john@contoso.com and import it to legaldiscovery@contoso.com.
- You can import the .pst file directly to the user's personal archive instead of their primary mailbox.
- By default, associated messages are imported if they exist in the .pst file. Associated messages are special messages that contain hidden data with information about rules, views, and forms. You can change this setting in the Exchange Management Shell (the *AssociatedMessagesCopyOption* parameter).
- By default, the Recoverable Items folder is imported if it exists in the .pst file. You can change this setting in the Exchange Management Shell (the *ExcludeDumpster* switch).
- In the Exchange Management Shell, you can include or exclude specific folders to import (the *IncludeFolders*, *ExcludeFolders*, or *SourceRootFolder* parameters).
- In the Exchange Management Shell, you can specify the destination folder for imported items in the target mailbox (the *TargetRootFolder* parameter).
- In the Exchange Management Shell, you can increase or decrease the priority value for mailbox import requests (the *Priority* parameter).

For mailbox import procedures, see Procedures for mailbox imports from .pst files in Exchange Server.

Export mailboxes to .pst files

Here are some things to consider when you export mailboxes to .pst files:

- You can create new mailbox export requests in the EAC or the Exchange Management Shell. To view, modify, suspend, resume, or remove mailbox export requests, you need to use the Exchange Management Shell.
- You can export a mailbox or a user's archive mailbox to a .pst file.
- By default, associated messages are exported from the mailbox. Associated messages are special messages that contain hidden data with information about rules, views, and forms. You can change this setting in the Exchange Management Shell (the *AssociatedMessagesCopyOption* parameter).
- By default, the Recoverable Items folder is exported from the mailbox. You can change this setting in the Exchange Management Shell (the *ExcludeDumpster* switch).
- In the Exchange Management Shell, you can filter the messages to export from the mailbox (the *ContentFilter* parameter). You can filter by message content, attachment, senders, recipients, Inbox category, importance, message type, message size, and when the message was sent, received, or expired.
- In the Exchange Management Shell, you can include or exclude specific folders to export (the *IncludeFolders*, *ExcludeFolders*, or *SourceRootFolder* parameters).

- In the Exchange Management Shell, you can specify the destination folder for exported items in the target .pst file (the *TargetRootFolder* parameter).

- In the Exchange Management Shell, you can increase or decrease the priority value for mailbox export requests (the *Priority* parameter).

For mailbox export procedures, see Procedures for mailbox exports to .pst files in Exchange Server.

Procedures for mailbox imports from .pst files in Exchange Server

8/3/2020 • 9 minutes to read • Edit Online

Mailbox import requests use the Microsoft Exchange Mailbox Replication service (MRS) to import the contents of .pst files into mailboxes. For more information, see Mailbox imports and exports in Exchange Server.

This topic shows you how to:

- Create mailbox import requests
- View mailbox import requests.
- Modify mailbox import requests that haven't completed.
- Suspend mailbox import requests that haven't completed or failed.
- Resume suspended or failed mailbox import requests
- Remove mailbox import requests.

What do you need to know before you begin?

IMPORTANT

The procedures in this topic require the Mailbox Import Export role, which isn't assigned to any role groups by default. To assign the role to a role group that you belong to, see Add a role to a role group. Note that changes in permission require you to log off and log on for the changes to take effect.

- Estimated time to complete each procedure: 5 minutes
- You need to import the .pst files from a UNC network share (\ *<Server>*\ *<Share>*\ or \ *<LocalServerName>*\c$). The Exchange Trusted Subsystem security group requires the Read permission to the network share. If the share doesn't have this permission, you'll get errors when you try to import .pst files to mailboxes.
- You can create mailbox import requests in the Exchange admin center (EAC) or in the Exchange Management Shell. All other procedures can only be done in the Exchange Management Shell. For more information about accessing and using the EAC, see Exchange admin center in Exchange Server. To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

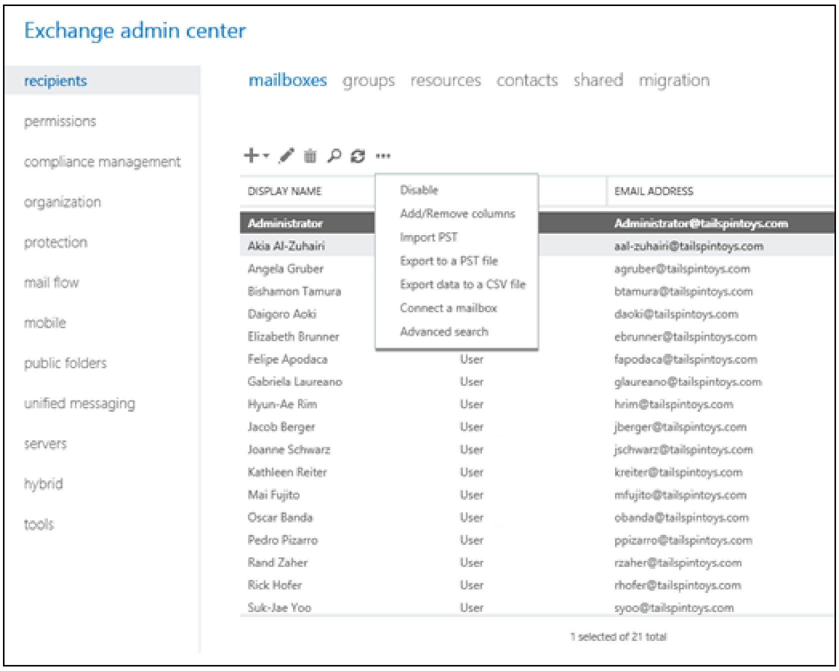
TIP

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Create mailbox import requests

Use the EAC to create a mailbox import request

1. In the EAC, go to **Recipients** > **Mailboxes** > click **More options** •••, and select **Import PST**.



DISPLAY NAME		EMAIL ADDRESS

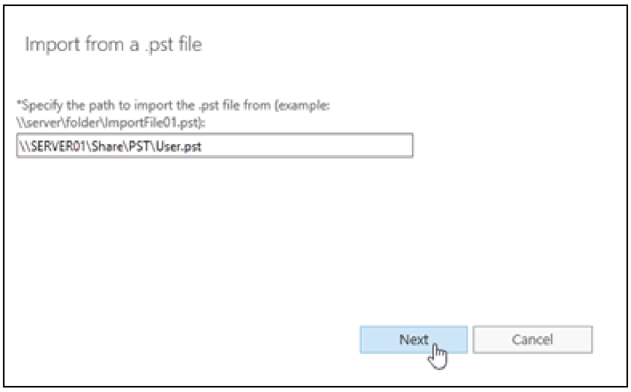
1 selected of 21 total

2. The **Import from a .pst** wizard opens. On the first page, enter the UNC path and filename of the source .pst file.



Import from a .pst file

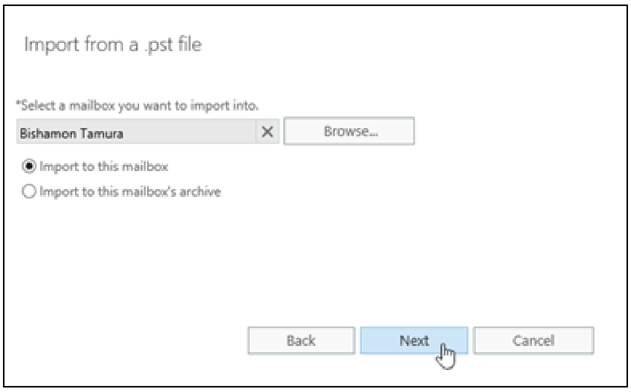
*Specify the path to import the .pst file from (example: \\server\folder\ImportFile01.pst):

\\SERVER01\Share\PST\User.pst

When you're finished, click **Next**.

3. On the next page, select the target mailbox, and then select one of these options:

- **Import to this mailbox**
- **Import to this mailbox's archive**



Import from a .pst file

*Select a mailbox you want to import into.

Bishamon Tamura

◉ Import to this mailbox

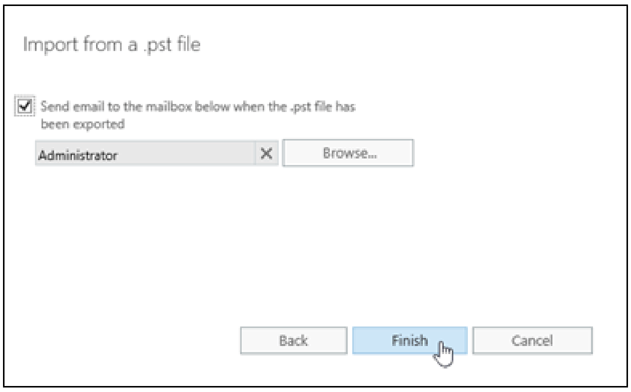
○ Import to this mailbox's archive

When you're finished, click **Next**.

4. On the last page, configure one of these settings:

- Leave the **Send email to the mailbox below when the .pst file has been exported** check box selected. Click **Browse** to add or remove notification recipients.

- Clear the **Send email to the mailbox below when the .pst file has been exported** check box.



Import from a .pst file

☑ Send email to the mailbox below when the .pst file has been exported

Administrator

When you're finished, click **Finish**.

Use the Exchange Management Shell to create a mailbox import request

To create a mailbox import request, use this syntax:

```
New-MailboxImportRequest  [-Name <UniqueName>] -FilePath <UNCPathToPST> -Mailbox <TargetMailboxIdentity> [-IsArchive] [-SourceRootFolder <PSTFolder>] [-TargetRootFolder <MailboxFolder>] [-IncludeFolders <MailboxFolder1>,<MailboxFolder2>...] [-ExcludeFolders <MailboxFolder1>,<MailboxFolder2>...] [-Priority <PriorityValue>]
```

This example creates a new mailbox import request with these settings:

- **Mailbox import request name**: The default value `MailboxImport` is used, because we aren't using the *Name* parameter. The unique identity of the mailbox import request is `<MailboxIdentity>\MailboxImportX` (*X* is either not present, or has the value 0 to 9).

- **Source .pst file**: \\SERVER01\PSTFiles\Archives\Vbarrios.pst

- **Target mailbox**: Valeria Barrios

- **Content and folders**: Content in all folder paths in the .pst file is replicated in the target mailbox. Content is merged under existing folders and new folders are created if they don't already exist.

- **Priority**: `Normal`, because we aren't using the *Priority* parameter.

```
New-MailboxImportRequest -FilePath \\SERVER01\PSTFiles\Archives\Vbarrios.pst -Mailbox "Valeria Barrios"
```

This example creates a new mailbox import request with these settings:

- **Mailbox import request name**: The custom name Kathleen Reiter Import is specified by the *Name* parameter. Specifying a custom name allows more than 10 mailbox import requests for the mailbox. The unique identity value of the mailbox import request is `<MailboxIdentity>\<MailboxImportRequestName>` (for example, `kreiter\Kathleen Reiter Import`).

- **Source .pst file**: \\SERVER01\PSTFiles\Archives\Recovered.pst

- **Target mailbox**: The archive mailbox for Kathleen Reiter (Kathleen's primary mailbox alias is kreiter).

- **Content and folders**: Only content in the Inbox folder of the .pst file is imported (regardless of the localized name of the folder), and it's imported to the Recovered Files folder in the target mailbox.

- **Priority**: `High`

```
New-MailboxImportRequest -Name "Kathleen Reiter Import" -FilePath \\SERVER01\PSTFiles\Recovered.pst -Mailbox
kreiter -IsArchive -IncludeFolders "#Inbox#" -TargetRootFolder "Recovered Files" -Priority High
```

For detailed syntax and parameter information, see New-MailboxImportRequest.

How do you know this worked?

To verify that you've successfully created a mailbox import request, do any of these steps:

- In the EAC, click the notification viewer 🔔 to view the status of the request.
- If you created the mailbox import request in the EAC, and selected the option to send notification email messages, check the notification messages. The sender is Microsoft Exchange. The first message has the subject `Your Import PST request has been received`. If the import request completed successfully, you'll receive another message with the subject `Import PST has finished`.
- Replace *<MailboxIdentity>* with the name, email address, or alias of the target mailbox, and run this command in the Exchange Management Shell to verify the basic property values:

  ```
  Get-MailboxImportRequest -Mailbox "<MailboxIdentity>" | Format-List Name,FilePath,Mailbox,Status
  ```

- Replace *<MailboxIdentity>* and *<MailboxImportRequestName>* with the appropriate values, and run this command in the Exchange Management Shell to verify the details:

  ```
  Get-MailboxImportRequestStatistics -Identity "<MailboxIdentity>\<MailboxImportRequestName>"
  ```

Use the Exchange Management Shell to view mailbox import requests

By default, the **Get-MailboxImportRequest** cmdlet returns the name, target mailbox, and status of mailbox import requests. If you pipeline the command to the **Format-List** cmdlet, you'll only get a limited number of additional useful details:

- **FilePath**: The source .pst file.
- **RequestGUID**: The unique GUID value of the mailbox import request.
- **RequestQueue**: The mailbox database that the import request is being run on.
- **BatchName**: The optional batch name for the mailbox import request.
- **Identity**: The unique identity value of the mailbox import request (*<MailboxIdentity>*\ *<MailboxImportRequestName>*).

By default, the **Get-MailboxImportRequestStatistics** cmdlet returns the name, status, alias of the target mailbox, and the completion percentage of mailbox import requests. If you pipeline the command to the **Format-List** cmdlet, you'll see detailed information about the mailbox import request.

This example returns the summary list of all mailbox import requests.

```
Get-MailboxImportRequest
```

This example returns additional information for mailbox import requests to the mailbox Akia Al-Zuhairi.

```
Get-MailboxImportRequest -Mailbox "Akia Al-Zuhairi" | Format-List
```

This example returns the summary list of in-progress mailbox import requests for mailboxes that reside on the mailbox database named DB01.

```
Get-MailboxImportRequest -Status InProgress -Database DB01
```

This example returns the summary list of completed mailbox import requests in the batch named Import DB01 PSTs.

```
Get-MailboxImportRequest -Status Completed -BatchName "Import DB01 PSTs"
```

For detailed syntax and parameter information, see Get-MailboxImportRequest.

To view detailed information about a mailbox import request, use this syntax:

```
Get-MailboxImportRequestStatistics -Identity <MailboxImportRequestIdentity> [-IncludeReport] | Format-List
```

Where *<MailboxImportRequestIdentity>* is the identity value of the mailbox import request (*<MailboxIdentity>*\ *<MailboxImportRequestName>* or *<RequestGUID>*).

This example returns detailed information for the mailbox import request named MailboxImport for Akia Al-Zuhairi's mailbox, including the log of actions in the **Report** property.

```
Get-MailboxImportRequestStatistics -Identity "aal-zuhairi\MailboxImport" -IncludeReport | Format-List
```

For detailed syntax and parameter information, see Get-MailboxImportRequestStatistics.

Use the Exchange Management Shell to modify mailbox import requests

You can modify mailbox import requests that haven't completed. You can't modify the fundamental settings of an existing request (for example, the source .pst file, target mailbox, the source content in the .pst file, or the destination in the target mailbox).

To modify a mailbox import request, use this syntax:

```
Set-MailboxImportRequest -Identity <MailboxIdentity>\<MailboxImportRequestName> [-BadItemLimit <value>] [-LargeItemLimit <value>] [-AcceptLargeDataLoss]
```

This example modifies the failed mailbox import request for the mailbox of Valeria Barrios to accept up to five corrupted mailbox items.

```
Set-MailboxImportRequest -Identity "Valeria Barrios\MailboxImport" -BadItemLimit 5
```

For detailed syntax and parameter information, see Set-MailboxImportRequest.

Note: After you modify a suspended or failed mailbox import request, you need to resume it by using the **Resume-MailboxImportRequest** cmdlet.

How do you know this worked?

To verify that you've successfully modified a mailbox import request, replace *<MailboxIdentity>* and *<MailboxImportRequestName>* with the appropriate values, and run this command in the Exchange Management Shell to verify the details:

```
Get-MailboxImportRequestStatistics -Identity "<MailboxIdentity>\<MailboxImportRequestName>" | Format-List
```

Use the Exchange Management Shell to suspend mailbox import requests

You can suspend mailbox import requests that are in progress. You can't suspend completed or failed mailbox import requests.

To suspend a mailbox import request, use this syntax:

```
Suspend-MailboxImportRequest -Identity <MailboxIdentity>\<MailboxImportRequestName> [-SuspendComment "
<Descriptive Comment>"]
```

This example suspends the mailbox import request to Kathleen Reiter's mailbox that's named Kathleen Reiter Import.

```
Suspend-MailboxImportRequest -Identity "kreiter@contoso.com\Kathleen Reiter Import"
```

This example suspends all in-progress mailbox import requests with the comment "OK to resume after 10 P.M. on Monday 6/19"

```
Get-MailboxImportRequest -Status InProgress | Suspend-MailboxImportRequest -SuspendComment "OK to resume after
10 P.M. on Monday 6/19"
```

For detailed syntax and parameter information, see Suspend-MailboxImportRequest.

Notes:

- You can also use the **New-MailboxImportRequest** cmdlet with the *Suspend* switch to create a suspended mailbox import request.

- You use the **Resume-MailboxImportRequest** parameter to resume suspended mailbox import requests.

How do you know this worked?

To verify that you've successfully suspended a mailbox import request, do any of these steps:

- Replace *<MailboxIdentity>* with the name, email address, or alias of the target mailbox, run this command in the Exchange Management Shell, and verify that the **Status** property has the value `Suspended`:

  ```
  Get-MailboxImportRequest -Mailbox "<MailboxIdentity>" | Format-List Name,FilePath,Mailbox,Status
  ```

- Run this command in the Exchange Management Shell, and verify that the suspended mailbox import request is listed:

  ```
  Get-MailboxImportRequest -Status Suspended
  ```

Use the Exchange Management Shell to resume mailbox import requests

You can resume suspended or failed mailbox import requests.

To resume a mailbox import request, use this syntax:

```
Resume-MailboxImportRequest -Identity <MailboxIdentity>\<MailboxImportRequestName>
```

This example resumes the failed mailbox import request for Valeria Barrios' mailbox.

```
Resume-MailboxImportRequest -Identity vbarrios\MailboxImport
```

This example resumes all suspended mailbox import requests.

```
Get-MailboxImportRequest -Status Suspended | Resume-MailboxImportRequest
```

For detailed syntax and parameter information, see Resume-MailboxImportRequest.

How do you know this worked?

To verify that you've successfully resumed a mailbox import request, replace *<MailboxIdentity>* with the name, email address, or alias of the target mailbox, run this command in the Exchange Management Shell, and verify that the **Status** property doesn't have the value `Suspended`:

```
Get-MailboxImportRequest -Mailbox <MailboxIdentity> | Format-List Name,FilePath,Mailbox,Status
```

Use the Exchange Management Shell to remove mailbox import requests

You can remove fully or partially completed mailbox import requests.

- If you remove a partially completed mailbox import request, the request is removed from the MRS job queue. Any content that's already been imported from the .pst file isn't removed from the target mailbox.
- By default, completed mailbox import request are removed after 30 days (you can override this value with the *CompletedRequestAgeLimit* parameter), and failed requests aren't automatically removed. But, if you use the *RequestExpiryInterval* parameter when you create or modify a mailbox import request, these results are available:
  - **RequestExpiryInterval with a timespan value**: Completed and failed requests are automatically removed after the specified timespan.
  - **RequestExpiryInterval with the value unlimited**: Completed and failed requests aren't automatically removed.

This example removes the mailbox import request named MailboxImport for Akia Al-Zuhairi's mailbox.

```
Remove-MailboxImportRequest -Identity "aal-zuhairi\MailboxImport"
```

This example removes all completed mailbox import requests.

```
Get-MailboxImportRequest -Status Completed | Remove-MailboxImportRequest
```

For detailed syntax and parameter information, see Remove-MailboxImportRequest.

How do you know this worked?

To verify that you've successfully removed a mailbox import request, replace *<MailboxIdentity>* with the name, email address, or alias of the target mailbox, run this command in the Exchange Management Shell, and verify that the mailbox import request isn't listed:

```
Get-MailboxImportRequest -Mailbox <MailboxIdentity> | Format-List Name,FilePath,Mailbox,Status
```

Procedures for mailbox exports to .pst files in Exchange Server

8/3/2020 • 9 minutes to read • Edit Online

Mailbox export requests use the Microsoft Exchange Mailbox Replication service (MRS) to export the contents of mailboxes to .pst files. For more information, see Mailbox imports and exports in Exchange Server.

This topic shows you how to:

- Create mailbox export requests.
- View mailbox export requests.
- Modify mailbox export requests that haven't completed.
- Suspend mailbox export requests that haven't completed or failed.
- Resume suspended or failed mailbox export requests
- Remove mailbox export requests.

What do you need to know before you begin?

IMPORTANT

The procedures in this topic require the Mailbox Import Export role, which isn't assigned to any role groups by default. To assign the role to a role group that you belong to, see Add a role to a role group. Note that changes in permission require you to log off and log on for the changes to take effect.

- Estimated time to complete each procedure: 5 minutes
- You need to export mailboxes to .pst files on a UNC network share (\ *<Server>*\ *<Share>*\ or \ *<LocalServerName>*\c$). The Exchange Trusted Subsystem security group requires the Read/Write permission to the network share. If the share doesn't have this permission, you'll get errors when you try to export mailboxes to .pst files.
- You can create mailbox export requests in the Exchange admin center (EAC) or in the Exchange Management Shell. All other procedures can only be done in the Exchange Management Shell. For more information about accessing and using the EAC, see Exchange admin center in Exchange Server. To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

TIP

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Create mailbox export requests

Use the EAC to create a mailbox export request

1. In the EAC, go to **Recipients** > **Mailboxes** > click **More options** ***, and select **Export to a PST file**.

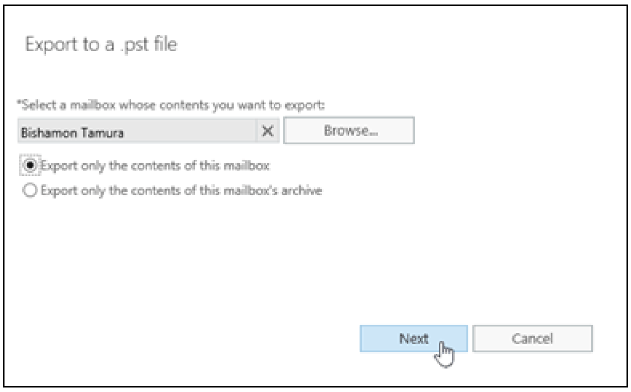
2. The **Export to a .pst file** wizard opens. On the first page, select the source mailbox, and then select one of these options:

   - **Export only the contents of this mailbox**

   - **Export only the contents of this mailbox's archive**



Export to a .pst file

*Select a mailbox whose contents you want to export:

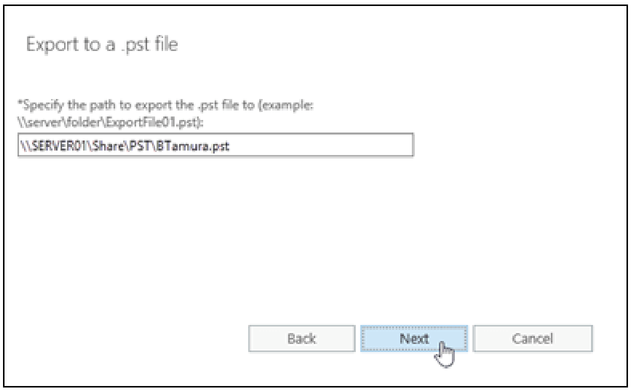
Bishamon Tamura

● Export only the contents of this mailbox

○ Export only the contents of this mailbox's archive

When you're finished, click **Next**.

3. On the next page, enter the UNC path and filename of the target .pst file.



Export to a .pst file

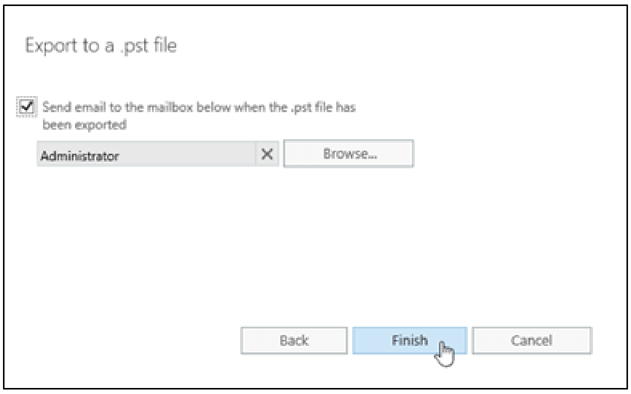
*Specify the path to export the .pst file to (example: \\server\folder\ExportFile01.pst):

\\SERVER01\Share\PST\BTamura.pst

When you're finished, click **Next**.

4. On the last page, configure one of these settings:

- Leave the **Send email to the mailbox below when the .pst file has been exported** check box selected. Click **Browse** to add or remove notification recipients.
- Clear the **Send email to the mailbox below when the .pst file has been exported** check box.



Export to a .pst file

☑ Send email to the mailbox below when the .pst file has been exported

Administrator

When you're finished, click **Finish**.

Use the Exchange Management Shell to create a mailbox export request

To create a mailbox export request, use this syntax:

```
New-MailboxExportRequest  [-Name <UniqueName>] -Mailbox <TargetMailboxIdentity> -FilePath <UNCPathToPST> [-IsArchive] [-SourceRootFolder <MailboxFolder>] [-TargetRootFolder <PSTFolder>] [-IncludeFolders <MailboxFolder1>,<MailboxFolder2>...] [-ExcludeFolders <MailboxFolder1>,<MailboxFolder2>...] [-ContentFilter <Filter>] [-Priority <PriorityValue>]
```

This example creates a new mailbox export request with these settings:

- **Mailbox export request name**: The default value `MailboxExport` is used, because we aren't using the *Name* parameter. The unique identity of the mailbox export request is `<MailboxIdentity>\MailboxExportX` (*X* is either not present, or has the value 0 to 9).
- **Source mailbox**: Valeria Barrios
- **Target .pst file**: \SERVER01\PSTFiles\Vbarrios.pst
- **Content and folders**: Content in all folder paths in the source mailbox is replicated in the target .pst file.
- **Priority**: `Normal`, because we aren't using the *Priority* parameter.

```
New-MailboxExportRequest -Mailbox "Valeria Barrios" -FilePath \\SERVER01\PSTFiles\Vbarrios.pst
```

This example creates a new mailbox export request with these settings:

- **Mailbox export request name**: The custom name Kathleen Reiter Export is specified by the *Name* parameter. Specifying a custom name allows more than 10 mailbox export requests for the mailbox. The unique identity value of the mailbox export request is `<MailboxIdentity>\<MailboxExportRequestName>` (for example, `kreiter\Kathleen Reiter Export`).
- **Source mailbox**: The archive mailbox for Kathleen Reiter (Kathleen's primary mailbox alias is kreiter).
- **Target .pst file**: \SERVER01\PSTFiles\Archives\Kathleen Reiter.pst
- **Content and folders**: Only content in the Inbox folder of the mailbox is exported (regardless of the localized name of the folder).
- **Priority**: `High`

```
New-MailboxExportRequest -Name "Kathleen Reiter Export" -Mailbox kreiter -FilePath
"\\SERVER01\PSTFiles\Kathleen Reiter.pst" -IsArchive -IncludeFolders "#Inbox#" -Priority Hight
```

For detailed syntax and parameter information, see New-MailboxExportRequest.

How do you know this worked?

To verify that you've successfully created a mailbox export request, do any of these steps:

- In the EAC, click the notification viewer 🔔 to view the status of the request.
- If you created the mailbox export request in the EAC, and selected the option to send notification email messages, check the notification messages. The sender is Microsoft Exchange. The first message has the subject `Your Export PST request has been received`. If the export request completed successfully, you'll receive another message with the subject `Export PST has finished`.
- Replace *<MailboxIdentity>* with the name, email address, or alias of the source mailbox, and run this command in the Exchange Management Shell to verify the basic property values:

  ```
  Get-MailboxExportRequest -Mailbox "<MailboxIdentity>" | Format-List Name,FilePath,Mailbox,Status
  ```

- Replace *<MailboxIdentity>* and *<MailboxExportRequestName>* with the appropriate values, and run this command in the Exchange Management Shell to verify the details:

  ```
  Get-MailboxExportRequestStatistics -Identity "<MailboxIdentity>\<MailboxExportRequestName>"
  ```

Use the Exchange Management Shell to view mailbox export requests

By default, the **Get-MailboxExportRequest** cmdlet returns the name, source mailbox, and status of mailbox export requests. If you pipeline the command to the **Format-List** cmdlet, you'll only get a limited number of additional useful details:

- **FilePath**: The target .pst file.
- **RequestGUID**: The unique GUID value of the mailbox export request.
- **RequestQueue**: The mailbox database that the export request is being run on.
- **BatchName**: The optional batch name for the mailbox export request.
- **Identity**: The unique identity value of the mailbox export request (*<MailboxIdentity>*\ *<MailboxExportRequestName>*).

By default, the **Get-MailboxExportRequestStatistics** cmdlet returns the name, status, alias of the source mailbox, and the completion percentage of mailbox export requests. If you pipeline the command to the **Format-List** cmdlet, you'll see detailed information about the mailbox export request.

This example returns the summary list of all mailbox export requests.

```
Get-MailboxExportRequest
```

This example returns additional information for mailbox export requests from the mailbox Akia Al-Zuhairi.

```
Get-MailboxExportRequest -Mailbox "Akia Al-Zuhairi" | Format-List
```

This example returns the summary list of in-progress mailbox export requests for mailboxes that reside on the mailbox database named DB01.

```
Get-MailboxExportRequest -Status InProgress -Database DB01
```

This example returns the summary list of completed mailbox export requests in the batch named Export DB01 PSTs.

```
Get-MailboxExportRequest -Status Completed -BatchName "Export DB01 PSTs"
```

For detailed syntax and parameter information, see Get-MailboxExportRequest.

To view detailed information about a mailbox export request, use this syntax:

```
Get-MailboxExportRequestStatistics -Identity <MailboxExportRequestIdentity> [-IncludeReport] | Format-List
```

Where *<MailboxExportRequestIdentity>* is the identity value of the mailbox export request (*<MailboxIdentity>\<MailboxExportRequestName>* or *<RequestGUID>*).

This example returns detailed information for the mailbox export request named MailboxExport for Akia Al-Zuhairi's mailbox, including the log of actions in the **Report** property.

```
Get-MailboxExportRequestStatistics -Identity "aal-zuhairi\MailboxExport" -IncludeReport | Format-List
```

For detailed syntax and parameter information, see Get-MailboxExportRequestStatistics.

Use the Exchange Management Shell to modify mailbox export requests

You can modify mailbox export requests that haven't completed. You can't modify the fundamental settings of an existing request (for example, the source mailbox, target .pst file, the source content in the mailbox, or the destination in the target .pst file).

To modify a mailbox export request, use this syntax:

```
Set-MailboxExportRequest -Identity <MailboxIdentity>\<MailboxExportRequestName> [-BadItemLimit <value>] [-
LargeItemLimit <value>] [-AcceptLargeDataLoss]
```

This example modifies the failed mailbox export request for the mailbox of Valeria Barrios to accept up to five corrupted mailbox items.

```
Set-MailboxExportRequest -Identity "Valeria Barrios\MailboxExport" -BadItemLimit 5
```

For detailed syntax and parameter information, see Set-MailboxExportRequest.

Note: After you modify a suspended or failed mailbox export request, you need to resume it by using the **Resume-MailboxExportRequest** cmdlet.

How do you know this worked?

To verify that you've successfully modified a mailbox export request, replace *<MailboxIdentity>* and *<MailboxExportRequestName>* with the appropriate values, and run this command in the Exchange Management Shell to verify the details:

```
Get-MailboxExportRequestStatistics -Identity "<MailboxIdentity>\<MailboxExportRequestName>" | Format-List
```

Use theExchange Management Shell to suspend mailbox export requests

You can suspend mailbox export requests that are in progress. You can't suspend completed or failed mailbox export requests.

To suspend a mailbox export request, use this syntax:

```
Suspend-MailboxExportRequest -Identity <MailboxIdentity>\<MailboxExportRequestName> [-SuspendComment "
<Descriptive Comment>"]
```

This example suspends the mailbox export request from Kathleen Reiter's mailbox that's named Kathleen Reiter Export.

```
Suspend-MailboxExportRequest -Identity "kreiter@contoso.com\Kathleen Reiter Export"
```

This example suspends all in-progress mailbox export requests with the comment "OK to resume after 10 P.M. on Monday 6/19"

```
Get-MailboxExportRequest -Status InProgress | Suspend-MailboxExportRequest -SuspendComment "OK to resume after
10 P.M. on Monday 6/19"
```

For detailed syntax and parameter information, see Suspend-MailboxExportRequest.

Notes:

- You can also use the **New-MailboxExportRequest** cmdlet with the *Suspend* switch to create a suspended mailbox export request.
- You use the **Resume-MailboxExportRequest** parameter to resume suspended mailbox export requests.

How do you know this worked?

To verify that you've successfully suspended a mailbox export request, do any of these steps:

- Replace *<MailboxIdentity>* with the name, email address, or alias of the source mailbox, run this command in the Exchange Management Shell, and verify that the **Status** property has the value `Suspended`:

  ```
  Get-MailboxExportRequest -Mailbox "<MailboxIdentity>" | Format-List Name,FilePath,Mailbox,Status
  ```

- Run this command in the Exchange Management Shell, and verify that the suspended mailbox export request is listed:

  ```
  Get-MailboxExportRequest -Status Suspended
  ```

Use the Exchange Management Shell to resume mailbox export requests

You can resume suspended or failed mailbox export requests.

To resume a mailbox export request, use this syntax:

```
Resume-MailboxExportRequest -Identity <MailboxIdentity>\<MailboxExportRequestName>
```

This example resumes the failed mailbox export request for Valeria Barrios' mailbox.

```
Resume-MailboxExportRequest -Identity vbarrios\MailboxExport
```

This example resumes all suspended mailbox export requests.

```
Get-MailboxExportRequest -Status Suspended | Resume-MailboxExportRequest
```

For detailed syntax and parameter information, see Resume-MailboxExportRequest.

How do you know this worked?

To verify that you've successfully resumed a mailbox export request, replace *<MailboxIdentity>* with the name, email address, or alias of the source mailbox, run this command in the Exchange Management Shell, and verify that the **Status** property doesn't have the value `Suspended`:

```
Get-MailboxExportRequest -Mailbox <MailboxIdentity> | Format-List Name,FilePath,Mailbox,Status
```

Use the Exchange Management Shell to remove mailbox export requests

You can remove fully or partially completed mailbox export requests.

- If you remove a partially completed mailbox export request, the request is removed from the MRS job queue. Any content that's already been exported from the source mailbox isn't removed from the target .pst file.
- By default, completed mailbox export request are removed after 30 days (you can override this value with the *CompletedRequestAgeLimit* parameter), and failed requests aren't automatically removed. But, if you use the *RequestExpiryInterval* parameter when you create or modify a mailbox export request, these results are available:
    - **RequestExpiryInterval with a timespan value**: Completed and failed requests are automatically removed after the specified timespan.
    - **RequestExpiryInterval with the value unlimited**: Completed and failed requests aren't automatically removed.

This example removes the mailbox export request named MailboxExport for Akia Al-Zuhairi's mailbox.

```
Remove-MailboxExportRequest -Identity "aal-zuhairi\MailboxExport"
```

This example removes all completed mailbox export requests.

```
Get-MailboxExportRequest -Status Completed | Remove-MailboxExportRequest
```

For detailed syntax and parameter information, see Remove-MailboxExportRequest.

How do you know this worked?

To verify that you've successfully removed a mailbox export request, replace *<MailboxIdentity>* with the name, email address, or alias of the source mailbox, run this command in the Exchange Management Shell, and verify that the mailbox export request isn't listed:

```
Get-MailboxExportRequest -Mailbox <MailboxIdentity> | Format-List Name,FilePath,Mailbox,Status
```

Clients and mobile in Exchange Server

8/3/2020 • 2 minutes to read • Edit Online

There are many different clients that you can use to access information in an Exchange mailbox. These clients include desktop programs such as Outlook, Outlook on the web (formerly known as Outlook Web App), and mobile clients such as mobile phones, tablets, and other mobile devices. Each of these clients offers a variety of features.

The following table contains links to topics that will help you learn about and manage some of the clients and client access methods that you can use to access your Exchange mailbox.

TOPIC	DESCRIPTION
MAPI over HTTP in Exchange Server	Learn about the latest client access method that provides connectivity to Outlook.
Outlook Anywhere	Learn about the earlier client access method that provides connectivity to Outlook. (This feature was formerly known as RPC/HTTP.)
Exchange ActiveSync	Learn about the protocol that provides connectivity to a wide variety of mobile phones and tablets. Using Exchange ActiveSync, users can access email, calendar, contact, and task information.
POP3 and IMAP4 in Exchange Server	Learn about how users can access their Exchange mailbox by using email programs that use POP3 or IMAP4.
Outlook for iOS and Android	Learn about the Outlook for iOS and Android app and how it allows your users to securely access their mailbox data remotely with their iOS and Android devices.
Install Office Online Server in an Exchange organization	Learn about how the integration of Office Online Server helps provide rich attachment preview functionality in Outlook on the web.
Outlook on the web in Exchange Server	Learn about Outlook on the web, which provides users access to their Exchange mailbox through a web browser.
MailTips in Exchange	Learn about MailTips, the informative messages displayed to users while they're composing a message.

MAPI over HTTP in Exchange Server

8/3/2020 • 3 minutes to read • Edit Online

Messaging Application Programming Interface (MAPI) over HTTP is a transport protocol that improves the reliability and stability of the Outlook and Exchange connections by moving the transport layer to the industry-standard HTTP model. This allows a higher level of visibility of transport errors and enhanced recoverability. Additional functionality includes support for an explicit pause-and-resume function. This enables supported clients to change networks or resume from hibernation while maintaining the same server context.

Implementing MAPI over HTTP does not mean that it is the only protocol that can be used for Outlook to access Exchange. Outlook clients that are not MAPI over HTTP capable can still use Outlook Anywhere (RPC over HTTP) to access Exchange through a MAPI-enabled Client Access server.

In Exchange 2016 and Exchange 2019, MAPI over HTTP can be applied across your entire organization, or at the individual mailbox level.

Benefits of MAPI over HTTP

MAPI over HTTP offers the following benefits to the clients that support it:

- Enables future innovation in authentication by using an HTTP based protocol.
- Provides faster reconnection times after a communications break because only TCP connections (not RPC connections) need to be rebuilt. Examples of a communication break include:
  - Device hibernation
  - Changing from a wired network to a wireless or cellular network
- Offers a session context that is not dependent on the connection. The server maintains the session context for a configurable period of time, even if the user changes networks.

MAPI over HTTP when upgrading Exchange

In Exchange 2016 or later, MAPI over HTTP is enabled by default at the organization level, although you still need to configure the virtual directories as described in Configure MAPI over HTTP for users to take advantage of it.

The scenarios where MAPI over HTTP is enabled or disabled by default at the organization level are described in the following table:

	EXCHANGE 2019	EXCHANGE 2016
Upgrading from an Exchange 2016 environment	MAPI over HTTP is enabled by default	n/a
Upgrading from an environment that contains any Exchange 2013 servers	MAPI over HTTP is disabled by default	MAPI over HTTP is disabled by default
Upgrading from an Exchange 2010 environment	n/a	MAPI over HTTP is enabled by default

During the upgrade from an organization that contains Exchange 2013 servers, administrators will receive the

MAPI over HTTP isn't enabled [WarnMapiHttpNotEnabled] readiness check warning, and enabling MAPI over HTTP post-installation is recommended. In any organization that contains Exchange 2013 servers, MAPI over HTTP won't be enabled by default, and administrators will need to follow the steps in Configure MAPI over HTTP to enable it.

Supportability and Prerequisites

Consider the following requirements to enable MAPI over HTTP.

Supportability

Use the following matrix to verify that your clients and servers support MAPI over HTTP.

PRODUCT	EXCHANGE 2019	EXCHANGE 2016	EXCHANGE 2013 SP1	EXCHANGE 2013 RTM	EXCHANGE 2010 SP3
Outlook 2013 SP1 and all later versions of Outlook	MAPI over HTTP Outlook Anywhere	MAPI over HTTP Outlook Anywhere	MAPI over HTTP Outlook Anywhere	Outlook Anywhere	RPC Outlook Anywhere
Outlook 2010 SP2 with updates KB2956191 and KB2965295 (April 14, 2015)	MAPI over HTTP Outlook Anywhere	MAPI over HTTP Outlook Anywhere	MAPI over HTTP Outlook Anywhere	Outlook Anywhere	RPC Outlook Anywhere
Outlook 2013 RTM	Outlook Anywhere	Outlook Anywhere	Outlook Anywhere	Outlook Anywhere	RPC Outlook Anywhere
All earlier versions of Outlook	Outlook Anywhere	Outlook Anywhere	Outlook Anywhere	Outlook Anywhere	RPC Outlook Anywhere

Prerequisites

The following conditions are required for clients and servers to support MAPI over HTTP with Exchange Server. Once the following prerequisites are in place, see Configure MAPI over HTTP to enable it in your organization.

- Supported Outlook clients (see the table in the previous section).
- .NET Framework 4.5.2 or later. Note that this is no longer an issue for Exchange 2016 CU5 or later. For more information about the .NET Framework requirements for Exchange 2016, see Supported .NET Framework versions for Exchange 2016.

Configure MAPI over HTTP in Exchange Server

8/3/2020 • 5 minutes to read • Edit Online

In Exchange 2016 and Exchange 2019, you can configure MAPI over HTTP at the organization level or at the individual mailbox level. Mailbox-level settings always take precedence over organization-wide settings.

The scenarios where MAPI over HTTP is enabled or disabled by default at the organization level are described in the following table:

	EXCHANGE 2019	EXCHANGE 2016
Upgrading from an Exchange 2016 environment	MAPI over HTTP is enabled by default	n/a
Upgrading from an environment that contains any Exchange 2013 servers	MAPI over HTTP is disabled by default	MAPI over HTTP is disabled by default
Upgrading from an Exchange 2010 environment	n/a	MAPI over HTTP is enabled by default

> **NOTE**
> When MAPI over HTTP is enabled at the organization level, the *MapiHttpEnabled* property value that's returned by the **Get-OrganizationConfig** cmdlet is `True`.

This topic describes how to configure and then enable MAPI over HTTP for Exchange organizations that contain Exchange 2013 servers, or for any topology where MAPI over HTTP has been previously disabled. You can also use the procedures in this article to disable MAPI over HTTP at the organization level.

This topic also describes how to enable or disable MAPI over HTTP for an individual mailbox. At the mailbox level, you have the ability to allow or block MAPI over HTTP connections internally, externally, or both. In all cases, when MAPI over HTTP is disabled, connections will be made with Outlook Anywhere.

Configure MAPI over HTTP

Complete the following steps to configure MAPI over HTTP for your organization. These steps assume you have already configured the prerequisites described in MAPI over HTTP in Exchange Server. Once configured (steps 1-3), use step 4 to enable or disable specific permission scenarios at the organization level, at the mailbox level, or both.

1. **Virtual directory configuration**: By default, Exchange creates a virtual directory for MAPI over HTTP. You use the **Set-MapiVirtualDirectory** cmdlet to configure the virtual directory. You need to configure an internal URL, an external URL, or both. For more information see, Set-MapiVirtualDirectory.

   For example, to configure the default MAPI virtual directory on the local Exchange server by setting the internal URL value to https://contoso.com/mapi, and the authentication method to `Negotiate`, run the following command:

```
Set-MapiVirtualDirectory -Identity "Contoso\mapi (Default Web Site)" -InternalUrl
https://Contoso.com/mapi -IISAuthenticationMethods Negotiate
```

2. **Certificate configuration**: The digital certificate used by your Exchange environment must include the same *InternalURL* and *ExternalURL* values that are defined on the MAPI virtual directory. For more information on Exchange certificate management, see Digital certificates and encryption in Exchange Server. Make sure the Exchange certificate is trusted on the Outlook client workstation and that there are no certificate errors, especially when you access the URLs configured on the MAPI virtual directory.

3. **Update server rules**: Verify that your load balancers, reverse proxies, and firewalls are configured to allow access to the MAPI over HTTP virtual directory.

4. Use the following steps to enable MAPI over HTTP in your entire Exchange organization, or enable MAPI over HTTP for one or more individual mailboxes.

   > **NOTE**
   >
   > After you run the commands below, Outlook clients with MAPI over HTTP enabled will see a message to restart Outlook to use MAPI over HTTP.

   #### Enable MAPI over HTTP in your Exchange organization

   To enable or disable MAPI over HTTP at the organizational level, use the **Set-OrganizationConfig** cmdlet with the *MapiHttpEnabled* parameter. Valid values are:

   - **$true**: MAPI over HTTP connections are allowed for all mailboxes in the organization (unless MAPI over HTTP is disabled on a specific mailbox).

   - **$false**: MAPI over HTTP connections aren't allowed for all mailboxes in the organization (unless MAPI over HTTP is enabled on a specific mailbox).

   The following example enables MAPI over HTTP connections for the entire organization:

   ```
   Set-OrganizationConfig -MapiHttpEnabled $true
   ```

   #### Enable MAPI over HTTP for an individual mailbox

   To enable or disable MAPI over HTTP at the mailbox level, use the **Set-CasMailbox** cmdlet with the *MapiHttpEnabled* parameter. Valid values are:

   - **$null**: The mailbox follows organization-level settings. This is the default value.

   - **$true**: Enable MAPI over HTTP for the mailbox. If MAPI over HTTP is disabled at the organizational level, it's enabled for the mailbox.

   - **$false**: Disable MAPI over HTTP for the mailbox. If MAPI over HTTP is enabled at the organizational level, it's disabled for the mailbox, so the mailbox will use Outlook Anywhere connections.

   The following example enables MAPI over HTTP connections for a single mailbox:

   ```
   Set-CasMailbox <user or mailbox ID> -MapiHttpEnabled $true
   ```

Test MAPI over HTTP connections

You can test the end-to-end MAPI over HTTP connection by using the **Test-OutlookConnectivity** cmdlet. To use the **Test-OutlookConnectivity** cmdlet, the Microsoft Exchange Health Manager (MSExchangeHM) service must be started.

The following example tests the MAPI over HTTP connection from the Exchange server named ContosoMail.

```
Test-OutlookConnectivity -RunFromServerId ContosoMail -ProbeIdentity OutlookMapiHttpSelfTestProbe
```

A successful test returns output that's similar to the following example:

```
MonitorIdentity                                          StartTime              EndTime                Result
Error     Exception
---------------                                          ---------              -------                ------
-----     ---------
OutlookMapiHttp.Protocol\OutlookMapiHttpSelfTestProbe    2/14/2018 7:15:00 AM   2/14/2018 7:15:10 AM
Succeeded
```

For more information, see Test-OutlookConnectivity.

Logs for MAPI over HTTP activity are at the following locations:

- %ExchangeInstallPath%Logging\MAPI Address Book Service\
- %ExchangeInstallPath%Logging\MAPI Client Access\
- %ExchangeInstallPath%Logging\HttpProxy\Mapi\

Combining MAPI over HTTP configurations and internal or external connections

In addition to the organization and mailbox settings described earlier in this topic, you can use the *MapiBlockOutlookExternalConnectivity* parameter on the **Set-CasMailbox** cmdlet to allow or deny external Outlook Anywhere or MAPI over HTTP connections to a specific mailbox. Valid values are:

- **True**: Only internal connections are allowed to the mailbox.
- **False**: Internal and external connections are allowed to the mailbox. This is the default value.

The following table summarizes the results of the different setting combinations at the organization level and on individual mailboxes.

MAPIHTTPENABLED VALUE ON SET-ORGANIZATIONCONFIG	MAPIHTTPENABLED VALUE ON SET-CASMAILBOX	MAPIBLOCKOUTLOOKEXTERNALCONNECTIVITY VALUE ON SET-CASMAILBOX	AUTODISCOVER RESULT
$true	$null	$false	MAPI over HTTP, internal and external
$true	$null	$true	MAPI over HTTP, internal only
$true	$true	$false	MAPI over HTTP, internal and external
$true	$true	$true	MAPI over HTTP, internal only
$true	$false	$false	Outlook Anywhere, internal and external

MAPIHTTPENABLED VALUE ON SET-ORGANIZATIONCONFIG	MAPIHTTPENABLED VALUE ON SET-CASMAILBOX	MAPIBLOCKOUTLOOKEXTERNALCONNECTIVITY VALUE ON SET-CASMAILBOX	AUTODISCOVER RESULT
$true	$false	$true	Outlook Anywhere, internal only
$false	$null	$false	Outlook Anywhere, internal and external
$false	$null	$true	Outlook Anywhere, internal only
$false	$true	$false	MAPI over HTTP, internal and external
$false	$true	$true	MAPI over HTTP, internal only
$false	$false	$false	Outlook Anywhere, internal and external
$false	$false	$true	Outlook Anywhere, internal only

Manage MAPI over HTTP

You can manage the configuration of MAPI over HTTP by using the following cmdlets:

- Set-MapiVirtualDirectory
- Get-MapiVirtualDirectory
- New-MapiVirtualDirectory
- Remove-MapiVirtualDirectory

Enable or disable MAPI access to mailboxes in Exchange Server

8/3/2020 • 4 minutes to read • Edit Online

MAPI is a client protocol that lets users access their mailbox by using Outlook or other MAPI email clients. By default, MAPI access to a user mailbox is enabled. Disabling MAPI access to a mailbox prevents the user from using Outlook to access their mailbox in Exchange mode. It doesn't prevent the user from using Outlook on the web or Outlook using other protocols (for example, POP3, IMAP4, or Exchange ActiveSync) to access their mailbox.

Administrators can use the Exchange admin center (EAC) or the Exchange Management Shell to enable or disable MAPI access to user mailbox.

For additional management tasks related to user access to mailboxes, see these topics:

- Enable or disable Outlook on the web access to mailboxes in Exchange Server
- Enable or disable Exchange ActiveSync access to mailboxes in Exchange Server
- Enable or disable POP3 or IMAP4 access to mailboxes in Exchange Server

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- For more information about accessing and using the EAC, see Exchange admin center in Exchange Server.
- To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Client Access user settings" entry in the Clients and mobile devices permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Enable or disable MAPI access to a single mailbox

Use the EAC to Enable or disable MAPI access to a single mailbox

1. In the EAC, go to **Recipients** > **Mailboxes**.
2. In the list of mailboxes, find the mailbox that you want to modify. You can:
   - Scroll through the list of mailboxes.
   - Click **Search** 🔍 and enter part of the user's name, email address, or alias.
   - Click **More options** ••• > **Advanced search** to find the mailbox.

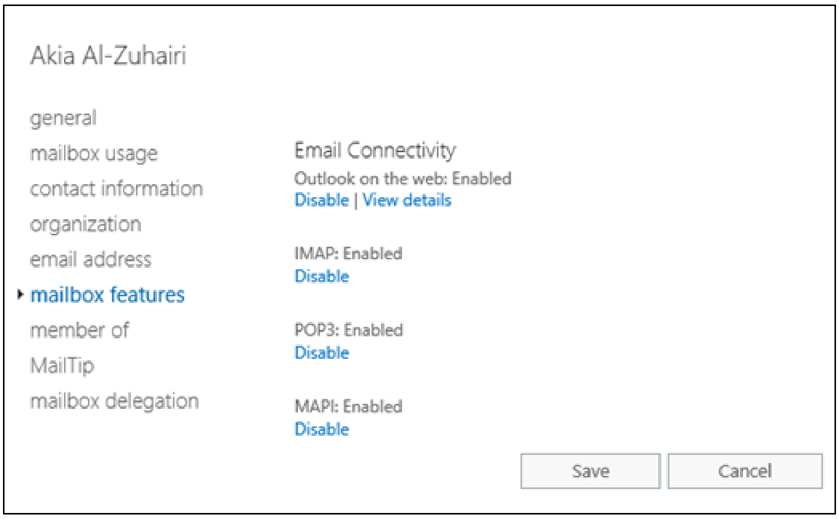
Once you've found the mailbox that you want to modify, select it, and then click **Edit** ✎.

3. On the mailbox properties page that opens, click **Mailbox features**.

4. In the **Email Connectivity** section, configure one of these settings:

   - If you see **MAPI: Enabled**, click **Disable** to disable it, and then click **Yes** in the warning message that appears.

   - If you see **MAPI: Disabled**, click **Enable** to enable it.



Akia Al-Zuhairi

Email Connectivity

Outlook on the web: Enabled
Disable | View details

IMAP: Enabled
Disable

POP3: Enabled
Disable

MAPI: Enabled
Disable

When you're finished, click **Save**.

Use the Exchange Management Shell to enable or disable MAPI access to a mailbox

To enable or disable MAPI access to a single mailbox, use this syntax:

```
Set-CasMailbox -Identity <MailboxIdentity> -MAPIEnabled <$true | $false>
```

This example disables MAPI access to the mailbox named Ken Sanchez.

```
Set-CasMailbox -Identity "Ken Sanchez" -MAPIEnabled $false
```

This example enables MAPI access to the mailbox named Esther Valle.

```
Set-CasMailbox -Identity "Esther Valle" -MAPIEnabled $true
```

For detailed syntax and parameter information, see Set-CASMailbox.

Enable or disable MAPI access to multiple mailboxes

Use the EAC to enable or disable MAPI access to multiple mailboxes

1. In the EAC, go to **Recipients** > **Mailboxes**.

2. In the list of mailboxes, find the mailboxes that you want to modify. You can:

   - Scroll through the list of mailboxes.

   - Click **Search** 🔎 and enter part of the user's name, email address, or alias.

   - Click **More options** ••• > **Advanced search** to find the mailbox.

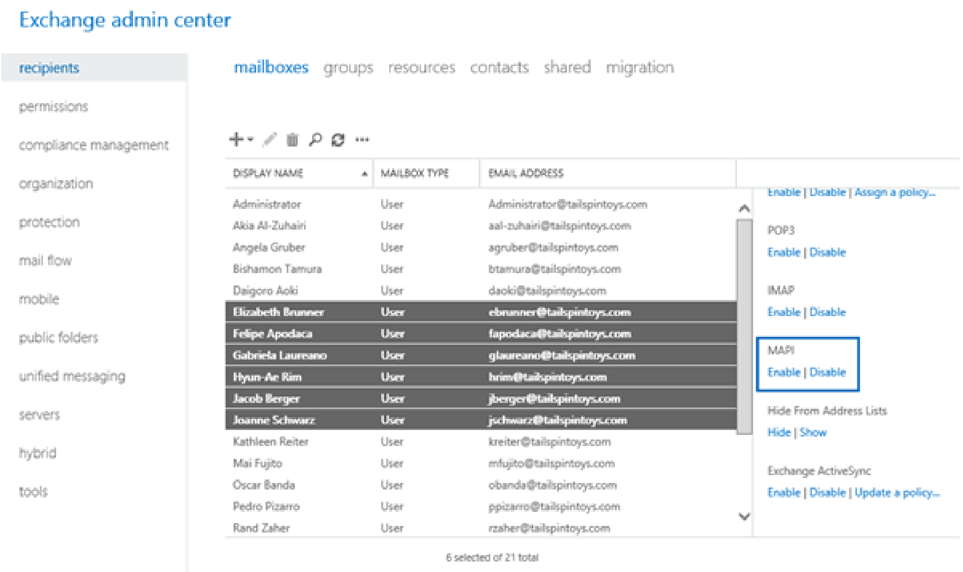
3. In the list of mailboxes, select multiple mailboxes of the same type (for example, **User**) from the list. For

example:

- Select a mailbox, hold down the Shift key, and select another mailbox that's farther down in the list.
- Hold down the CTRL key as you select each mailbox.

After you select multiple mailboxes of the same type, the title of the details pane changes to **Bulk Edit**.

4. In the details pane, scroll down to **MAPI**, click **Enable** or **Disable**, and then click **OK** in the warning message that appears.



DISPLAY NAME	MAILBOX TYPE	EMAIL ADDRESS
Administrator	User	Administrator@tailspintoys.com

Use the Exchange Management Shell to enable or disable MAPI access to multiple mailboxes

You can use the **Get-Mailbox**, **Get-User** or **Get-Content** cmdlets to identify the mailboxes that you want to modify. For example:

- Use the *OrganizationalUnit* parameter to filter the mailboxes by organizational unit (OU).
- Use the *Filter* parameter to create OPATH filters that identify the mailboxes. For more information, see Filterable Properties for the -Filter Parameter.
- Use a text file to specify the mailboxes. The text file contains one mailbox (email address, name, or other unique identifier) on each line like this:

  > ebrunner@tailspintoys.com
  > fapodaca@tailspintoys.com
  > glaureano@tailspintoys.com
  > hrim@tailspintoys.com

This example disables MAPI access to all user mailboxes in the North America\Finance OU.

```
$NAFinance = Get-Mailbox -OrganizationalUnit "OU=Marketing,OU=North America,DC=contoso,DC=com" -Filter
"RecipientTypeDetails -eq 'UserMailbox'" -ResultSize Unlimited; $NAFinance | foreach {Set-CasMailbox
$_.Identity -MAPIEnabled $false}
```

This example disables MAPI access to all user mailboxes in the Engineering department in Washington state.

```
Get-User -Filter "RecipientType -eq 'UserMailbox' -and Department -like 'Engineering*' -and StateOrProvince -
eq 'WA'" | Set-CasMailbox -MAPIEnabled $false
```

This example uses the text file C:\My Documents\Accounts.txt to disable MAPI access to the specified mailboxes.

```
Get-Content "C:\My Documents\Accounts.txt" | foreach {Set-CasMailbox $_ -MAPIEnabled $false}
```

For detailed syntax and parameter information, see Get-Mailbox and Get-User.

How do you know this worked?

To verify that you've successfully enabled or disabled MAPI access to a mailbox, do any of these steps:

- In the EAC, go to **Recipients** > **Mailboxes** > select the mailbox > click **Edit** ✎ > **Mailbox features** and verify the **MAPI** value in the **Email Connectivity** section.

  
  Email Connectivity
  Outlook on the web: Enabled
  IMAP: Enabled
  POP3: Enabled
  MAPI: Enabled

- In the Exchange Management Shell, replace *<MailboxIdentity>* with the identity of the mailbox (for example, name, alias, or email address), and run this command:

  ```
  Get-CasMailbox -Identity "<MailboxIdentity>"
  ```

- Use the same filter that you used to identify the mailboxes, but use the **Get-CasMailbox** cmdlet instead of **Set-CasMailbox**. For example:

  ```
  Get-User -Filter "RecipientType -eq 'UserMailbox' -and Department -like 'Engineering*' -and
  StateOrProvince -eq 'WA'" | Get-CasMailbox
  ```

- In the Exchange Management Shell, run this command to show all mailboxes where Outlook on the web access is disabled:

  ```
  Get-CasMailbox -ResultSize unlimited -Filter "MAPIEnabled -eq `$false"
  ```

Exchange ActiveSync

8/3/2020 • 3 minutes to read • Edit Online

Exchange ActiveSync is an Exchange synchronization protocol that's optimized to work together with high-latency and low-bandwidth networks. The protocol, based on HTTP and XML, lets mobile phones access an organization's information on a server that's running Microsoft Exchange.

Overview of Exchange ActiveSync

Exchange ActiveSync lets mobile phone users access their email, calendar, contacts, and tasks, and lets them continue to access this information when they're working offline.

Standard encryption services add security to mobile communication with the server. You can configure Exchange ActiveSync to use Secure Sockets Layer (SSL) encryption for communications between the Exchange server and the mobile device.

Features in Exchange ActiveSync

Exchange ActiveSync provides the following:

- Support for HTML messages
- Support for follow-up flags
- Conversation grouping of email messages
- Ability to synchronize or not synchronize an entire conversation
- Synchronization of Short Message Service (SMS) messages with a user's Exchange mailbox
- Support for viewing message reply status
- Support for fast message retrieval
- Meeting attendee information
- Enhanced Exchange Search
- PIN reset
- Enhanced device security through password policies
- Autodiscover for over-the-air provisioning
- Support for setting automatic replies when users are away, on vacation, or out of the office
- Support for task synchronization
- Direct Push
- Support for availability information for contacts

Managing Exchange ActiveSync

By default, Exchange ActiveSync is enabled. All users who have an Exchange mailbox can synchronize their mobile device with the Microsoft Exchange server.

You can perform the following Exchange ActiveSync tasks:

- Enable and disable Exchange ActiveSync for users
- Set policies such as minimum password length, device locking, and maximum failed password attempts
- Initiate a remote wipe to clear all data from a lost or stolen mobile phone
- Run a variety of reports for viewing or exporting into a variety of formats
- Control which types of mobile devices can synchronize with your organization through device access rules

Managing mobile device access in Exchange ActiveSync

You can control which mobile devices can synchronize with Exchange Server. You do this by monitoring new mobile devices as they connect to your organization or by setting up rules that determine which types of mobile devices are allowed to connect. Regardless of the method you choose to specify which mobile devices can synchronize, you can approve or deny access for any specific mobile device for a specific user at any time.

Device security features in Exchange ActiveSync

In addition to the ability to configure security options for communications between the Exchange server and your mobile devices, Exchange ActiveSync offers the following features to enhance the security of mobile devices:

- **Remote wipe**: If a mobile device is lost, stolen, or otherwise compromised, you can issue a remote wipe command from the Exchange Server computer or from any Web browser by using Outlook Web App. This command erases all data from the mobile device.
- **Device password policies**: Exchange ActiveSync lets you configure several options for device passwords. The device password options include the following:
  - **Minimum password length (characters)**: This option specifies the length of the password for the mobile device. The default length is 4 characters, but as many as 18 can be included.
  - **Minimum number of character sets**: Use this text box to specify the complexity of the alphanumeric password and force users to use a number of different sets of characters from among the following: lowercase letters, uppercase letters, symbols, and numbers.
  - **Require alphanumeric password**: This option determines password strength. You can enforce the usage of a character or symbol in the password in addition to numbers.
  - **Inactivity time (seconds)**: This option determines how long the mobile device must be inactive before the user is prompted for a password to unlock the mobile device.
  - **Enforce password history**: Select this check box to force the mobile phone to prevent the user from reusing their previous passwords. The number that you set determines the number of past passwords that the user won't be allowed to reuse.
  - **Enable password recovery**: Select this check box to enable password recovery for the mobile device. Administrators can use the **Get-ActiveSyncDeviceStatistics** cmdlet to look up the user's recovery password.
  - **Wipe device after failed (attempts)**: This option lets you specify whether you want the phone's memory to be wiped after multiple failed password attempts.
- **Device encryption policies**: There are a number of mobile device encryption policies that you can enforce for a group of users. These policies include the following:
  - **Require encryption on device**: Select this check box to require encryption on the mobile device. This increases security by encrypting all information on the mobile device.
  - **Require encryption on storage cards**: Select this check box to require encryption on the mobile

device's removable storage card. This increases security by encrypting all information on the storage cards for the mobile device.

Enable or disable Exchange ActiveSync access to mailboxes in Exchange Server

8/3/2020 • 5 minutes to read • Edit Online

ActiveSync is a client protocol that lets users synchronize their Exchange mailbox with a mobile device. By default, ActiveSync is enabled on new user mailboxes. Disabling ActiveSync on a mailbox prevents the user from synchronizing their mailbox with a mobile device (by using ActiveSync).

Administrators can use the Exchange admin center (EAC) or the Exchange Management Shell to enable or disable Exchange ActiveSync access to a mailbox.

For more information about ActiveSync, see Exchange ActiveSync.

For information about setting up email on your mobile device, see these topics:

- Set up Office apps and email on iOS devices
- Set up Office apps and email on Android

For additional management tasks related to user access to mailboxes, see these topics:

- Enable or disable Outlook on the web access to mailboxes in Exchange Server
- Enable or disable POP3 or IMAP4 access to mailboxes in Exchange Server
- Enable or disable MAPI access to mailboxes in Exchange Server

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- For more information about accessing and using the EAC, see Exchange admin center in Exchange Server.
- To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Exchange ActiveSync settings" entry in the Clients and mobile devices permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Enable or disable Exchange ActiveSync access to a single mailbox

Use the EAC to enable or disable Exchange ActiveSync access to a mailbox

1. In the EAC, go to **Recipients** > **Mailboxes**.

2. In the list of mailboxes, find the mailbox that you want to modify. You can:

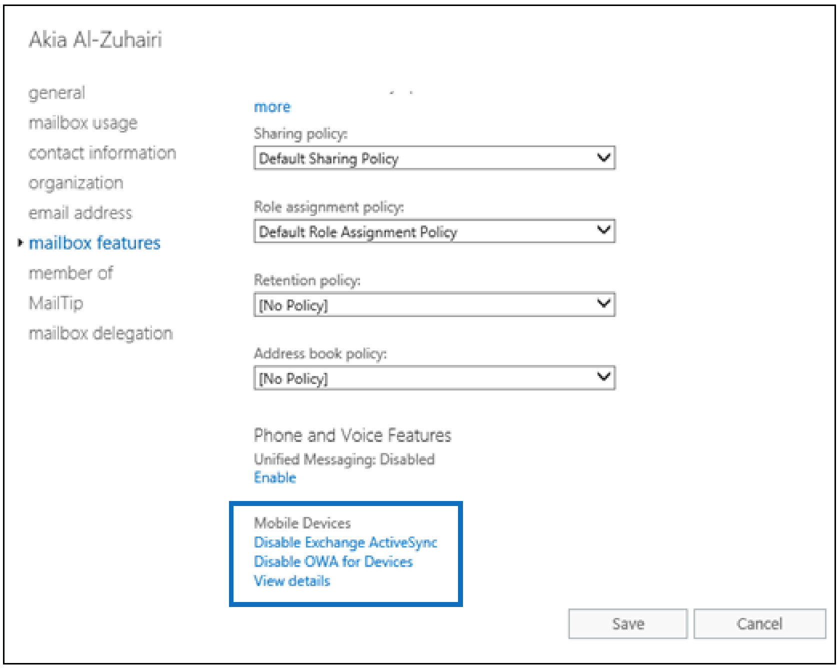
   - Scroll through the list of mailboxes.
   - Click **Search** and enter part of the user's name, email address, or alias.
   - Click **More options** ••• > **Advanced search** to find the mailbox.

   Once you've found the mailbox that you want to modify, select it, and then click **Edit** .

3. On the mailbox properties page that opens, click **Mailbox features**.

4. In the **Mobile Devices** section, configure one of these settings:

   - If ActiveSync is enabled on the mailbox, you'll see a **Disable Exchange ActiveSync** link. Click the link to disable ActiveSync, and then click **Yes** in the warning message that appears.
   - If ActiveSync is disabled on the mailbox, you'll see a **Enable Exchange ActiveSync** link. Click the link to enable ActiveSync.



Akia Al-Zuhairi

Sharing policy: Default Sharing Policy

Role assignment policy: Default Role Assignment Policy

Retention policy: [No Policy]

Address book policy: [No Policy]

Phone and Voice Features
Unified Messaging: Disabled
Enable

Mobile Devices
Disable Exchange ActiveSync
Disable OWA for Devices
View details

   When you're finished, click **Save**.

Use the Exchange Management Shell to enable or disable Exchange ActiveSync access to a mailbox

To enable or disable ActiveSync access to a single mailbox, use this syntax:

```
Set-CasMailbox -Identity <MailboxIdentity> -ActiveSyncEnabled <$true | $false>
```

This example disables ActiveSync access to the mailbox named Yan Li.

```
Set-CasMailbox -Identity "Yan Li" -ActiveSyncEnabled $false
```

This example enables ActiveSync access to the mailbox named Elly Nkya.

```
Set-CasMailbox -Identity "Elly Nkya" -ActiveSyncEnabled $true
```

For detailed syntax and parameter information, see Set-CASMailbox.

Enable or disable Exchange ActiveSync access to multiple mailboxes

Use the EAC to enable or disable Exchange ActiveSync access to multiple mailboxes

1. In the EAC, go to **Recipients** > **Mailboxes**.

2. In the list of mailboxes, find the mailboxes that you want to modify. You can:

   - Scroll through the list of mailboxes.

   - Click **Search** 🔎 and enter part of the user's name, email address, or alias.

   - Click **More options** ••• > **Advanced search** to find the mailbox.

3. In the list of mailboxes, select multiple mailboxes of the same type (for example, **User**) from the list. For example:

   - Select a mailbox, hold down the Shift key, and select another mailbox that's farther down in the list.

   - Hold down the CTRL key as you select each mailbox.

   After you select multiple mailboxes of the same type, the title of the details pane changes to **Bulk Edit**.

4. In the details pane, scroll down to **Exchange ActiveSync**, click **Enable** or **Disable**, and then click **OK** in the warning message that appears.

   Bulk select mailboxes in the EAC to enable or disable Exchange ActiveSync

Use the Exchange Management Shell to enable or disable Exchange ActiveSync access to multiple mailboxes

You can use the **Get-Mailbox**, **Get-User** or **Get-Content** cmdlets to identify the mailboxes that you want to modify. For example:

- Use the *OrganizationalUnit* parameter to filter the mailboxes by organizational unit (OU).

- Use the *Filter* parameter to create OPATH filters that identify the mailboxes. For more information, see Filterable Properties for the -Filter Parameter.

- Use a text file to specify the mailboxes. The text file contains one mailbox (email address, name, or other unique identifier) on each line like this:

  ```
  ebrunner@tailspintoys.com
  fapodaca@tailspintoys.com
  glaureano@tailspintoys.com
  hrim@tailspintoys.com
  ```

This example disables ActiveSync access to all user mailboxes in the North America\Finance OU.

```
$NAFinance = Get-Mailbox -OrganizationalUnit "OU=Marketing,OU=North America,DC=contoso,DC=com" -Filter
"RecipientTypeDetails -eq 'UserMailbox'" -ResultSize Unlimited; $NAFinance | foreach {Set-CasMailbox
$_.Identity -ActiveSyncEnabled $false}
```

This example disables ActiveSync access to all user mailboxes in the Engineering department in Washington state.

```
Get-User -Filter "RecipientType -eq 'UserMailbox' -and Department -like 'Engineering*' -and StateOrProvince -
eq 'WA'" | Set-CasMailbox -ActiveSyncEnabled $false
```

This example uses the text file C:\My Documents\Accounts.txt to disable ActiveSync access to the specified mailboxes.

```
Get-Content "C:\My Documents\Accounts.txt" | foreach {Set-CasMailbox $_ -ActiveSyncEnabled $false}
```

For detailed syntax and parameter information, see Get-Mailbox and Get-User.

How do you know this worked?

To verify that you've successfully enabled or disabled Exchange ActiveSync access to a mailbox, do any of these steps:

- In the EAC, go to **Recipients** > **Mailboxes** > select the mailbox > click **Edit** ✎ > **Mailbox features** > and verify the Exchange ActiveSync value in the **Mobile Devices** section.
    - If ActiveSync access is enabled for the mailbox, you'll see **Disable Exchange ActiveSync**.
    - If ActiveSync access is disabled for the mailbox, you'll see **Enable Exchange ActiveSync**.

- In the Exchange Management Shell, replace *<MailboxIdentity>* with the identity of the mailbox (for example, name, alias, or email address), and run this command:

```
Get-CasMailbox -Identity "<MailboxIdentity>"
```

- Use the same filter that you used to identify the mailboxes, but use the **Get-CasMailbox** cmdlet instead of **Set-CasMailbox**. For example:

```
Get-User -Filter "RecipientType -eq 'UserMailbox' -and Department -like 'Engineering*' -and
StateOrProvince -eq 'WA'" | Get-CasMailbox
```

- In the Exchange Management Shell, run this command to show all mailboxes where ActiveSync access is disabled:

```
Get-CasMailbox -ResultSize unlimited -Filter "ActiveSyncEnabled -eq `$false"
```

Mobile device mailbox policies

8/3/2020 • 9 minutes to read • Edit Online

In Exchange Server, you can create mobile device mailbox policies to apply a common set of policies or security settings to a collection of users. After you deploy Exchange ActiveSync in your Exchange Server organization, you can create new mobile device mailbox policies or modify existing policies. When you install Exchange Server, a default mobile device mailbox policy is created. All users are automatically assigned this default mobile device mailbox policy.

Overview of mobile device mailbox policies

You can use mobile device mailbox policies to manage many different settings. These include the following:

- Require a password
- Specify the minimum password length
- Require a number or special character in the password
- Designate how long a device can be inactive before requiring the user to re-enter a password
- Wipe a device after a specific number of failed password attempts

For more information about all the settings you can configure, see Mobile device policy settings.

Exchange mobile device mailbox policies

Exchange ActiveSync is a client protocol that lets you synchronize a mobile device with your Exchange mailbox. Exchange ActiveSync is enabled by default when you install Exchange Server.

You can create mobile device mailbox policies in the Exchange admin center (EAC) or the Exchange Management Shell. If you create a policy in the EAC, you can configure only a subset of the available settings. You can configure the rest of the settings using the Exchange Management Shell.

Mobile device password settings and biometrics

Many mobile devices support biometrics such as Apple Touch ID or Face ID. Exchange mobile device mailbox policies do not control whether biometrics can be used instead of typing the device PIN. Mobile device mailbox policies can be configured to require a device PIN, but then the users control whether they use biometrics after complying with the device PIN requirement.

Mobile device password settings and Android

Android 9.0 and earlier versions utilize Android's device admin functionality to manage device password settings defined in a mobile device mailbox policy.

With Android 10.0 and later, Android has removed device admin functionality. Instead, apps that require a screen lock query the device's (or the work profile's) screen lock complexity. Apps that require a stronger screen lock direct the user to the system screen lock settings, allowing the user to update the security settings to become compliant. At no time is the app aware of the user's password; the app is only aware of the password complexity level. Android supports the following four password complexity levels:

PASSWORD COMPLEXITY LEVEL	PASSWORD REQUIREMENTS
None	No password requirements are configured
Low	Password can be a pattern or a PIN with either repeating (4444) or ordered (1234, 4321, 2468) sequences
Medium	Passwords that meet one of the following criteria: - PIN with no repeating (4444) or ordered (1234, 4321, 2468) sequences with a minimum length of 4 characters - Alphabetic passwords with a minimum length of 4 characters - Alphanumeric passwords with a minimum length of 4 characters
High	Passwords that meet one of the following criteria: - PIN with no repeating (4444) or ordered (1234, 4321, 2468) sequences with a minimum length of 8 characters - Alphabetic passwords with a minimum length of 6 characters - Alphanumeric passwords with a minimum length of 6 characters

From the perspective of an Exchange mobile device mailbox policy, Android's password complexity levels are mapped to the following policy settings:

MOBILE DEVICE MAILBOX POLICY SETTING	ANDROID PASSWORD COMPLEXITY LEVEL
Password enabled = false	None
Allow simple password = true Min password length < 4	Low
Allow simple password = true Min password length < 6	Medium
Allow simple password = false Alphanumeric password required = true Min password length < 6	Medium
Allow simple password = true Min password length > 6	High
Allow simple password = false Alphanumeric password required = true Min password length >= 6	High

Mobile device mailbox policy settings

The following table summarizes the settings you can specify using mobile device mailbox policies.

SETTING	DESCRIPTION
Allow Bluetooth	This setting specifies whether a mobile device allows Bluetooth connections. The available options are Disable, HandsFree Only, and Allow. The default value is Allow.

SETTING	DESCRIPTION
Allow Browser	This setting specifies whether Pocket Internet Explorer is allowed on the mobile device. This setting doesn't affect third-party browsers installed on the mobile device. The default value is `$true`.
Allow Camera	This setting specifies whether the mobile device camera can be used. The default value is `$true`.
Allow Consumer EMail	This setting specifies whether the mobile device user can configure a personal email account (either POP3 or IMAP4) on the mobile device. The default value is `$true`. This setting doesn't control access to email accounts that are using third-party mobile device email programs.
Allow Desktop Sync	This setting specifies whether the mobile device can synchronize with a computer through a cable, Bluetooth, or IrDA connection. The default value is `$true`.
Allow External Device Management	This setting specifies whether an external device management program is allowed to manage the mobile device.
Allow HTML Email	This setting specifies whether email synchronized to the mobile device can be in HTML format. If this setting is set to `$false`, all email is converted to plain text.
Allow Internet Sharing	This setting specifies whether the mobile device can be used as a modem for a desktop or a portable computer. The default value is `$true`.
AllowIrDA	This setting specifies whether infrared connections are allowed to and from the mobile device.
Allow Mobile OTA Update	This setting specifies whether the mobile device mailbox policy settings can be sent to the mobile device over a cellular data connection. The default value is `$true`.
Allow non-provisionable devices	This setting specifies whether mobile devices that may not support application of all policy settings are allowed to connect to Exchange Server by using Exchange ActiveSync. Allowing non-provisionable mobile devices has security implications. For example, some non-provisionable devices may not be able to implement an organization's password requirements.
Allow POPIMAPEmail	This setting specifies whether the user can configure a POP3 or an IMAP4 email account on the mobile device. The default value is `$true`. This setting doesn't control access by third-party email programs.
Allow Remote Desktop	This setting specifies whether the mobile device can initiate a remote desktop connection. The default value is `true`.
Allow simple password	This setting enables or disables the ability to use a simple password such as 1111 or 1234. The default value is `$true`.

SETTING	DESCRIPTION
Allow S/MIME encryption algorithm negotiation	This setting specifies whether the messaging application on the mobile device can negotiate the encryption algorithm if a recipient's certificate doesn't support the specified encryption algorithm.
Allow S/MIME software certificates	This setting specifies whether S/MIME software certificates are allowed on the mobile device.
Allow storage card	This setting specifies whether the mobile device can access information that's stored on a storage card.
Allow text messaging	This setting specifies whether text messaging is allowed from the mobile device. The default value is `$true`.
Allow unsigned applications	This setting specifies whether unsigned applications can be installed on the mobile device. The default value is `$true`.
Allow unsigned installation packages	This setting specifies whether an unsigned installation package can be run on the mobile device. The default value is `$true`.
Allow Wi-Fi	This setting specifies whether wireless Internet access is allowed on the mobile device. The default value is `$true`.
Alphanumeric password required	This setting requires that a password contains numeric and non-numeric characters. The default value is `$true`.
Approved Application List	This setting stores a list of approved applications that can be run on the mobile device.
Attachments enabled	This setting enables attachments to be downloaded to the mobile device. The default value is `$true`.
Device encryption enabled	This setting enables encryption on the mobile device. Not all mobile devices can enforce encryption. For more information, see the device and mobile operating system documentation.
Device policy refresh interval	This setting specifies how often the mobile device mailbox policy is sent from the server to the mobile device.
IRM enabled	This setting specifies whether Information Rights Management (IRM) is enabled on the mobile device.
Max attachment size	This setting controls the maximum size of attachments that can be downloaded to the mobile device. The default value is Unlimited.

SETTING	DESCRIPTION
Max calendar age filter	This setting specifies the maximum range of calendar days that can be synchronized to the mobile device. The following values are accepted: 1: All 2: OneDay 3: ThreeDays 4: OneWeek 5: TwoWeeks 6: OneMonth
Max email age filter	This setting specifies the maximum number of days of email items to synchronize to the mobile device. The following values are accepted: 1: All 2: OneDay 3: ThreeDays 4: OneWeek 5: TwoWeeks 6: OneMonth
Max email body truncation size	This setting specifies the maximum size at which email messages are truncated when synchronized to the mobile device. The value is in kilobytes (KB).
Max email HTML body truncation size	This setting specifies the maximum size at which HTML email messages are truncated when synchronized to the mobile device. The value is in kilobytes (KB).
Max inactivity time lock	This value specifies the length of time that the mobile device can be inactive before a password is required to reactivate it. You can enter any interval between 30 seconds and 1 hour. The default value is 15 minutes.
Max password failed attempts	This setting specifies the number of attempts a user can make to enter the correct password for the mobile device. You can enter any number from 4 through 16. The default value is 8.
Min password complex characters	This setting specifies the number of character sets that are required in the password of the mobile device. The character sets are: * Lower case letters. * Upper case letters. * Digits 0 through 9. * Special characters (for example, exclamation marks). You can enter any number from 1 through 4. The default value is 1.
Min password length	This setting specifies the minimum number of characters in the mobile device password. You can enter any number from 1 through 16. The default value is 4.
Password enabled	This setting enables the mobile device password.
Password expiration	This setting enables the administrator to configure a length of time after which a mobile device password must be changed.

SETTING	DESCRIPTION
Password history	This setting specifies the number of past passwords that can be stored in a user's mailbox. A user can't reuse a stored password.
Password recovery enabled	When this setting is enabled, the mobile device generates a recovery password that's sent to the server. If the user forgets their mobile device password, the recovery password can be used to unlock the mobile device and enable the user to create a new mobile device password.
Require device encryption	This setting specifies whether device encryption is required. If set to `$true`, the mobile device must be able to support and implement encryption to synchronize with the server.
Require encrypted S/MIME messages	This setting specifies whether S/MIME messages must be encrypted. The default value is `$false`.
Require encryption S/MIME algorithm	This setting specifies what required algorithm must be used when encrypting S/MIME messages.
Require manual synchronization while roaming	This setting specifies whether the mobile device must synchronize manually while roaming. Allowing automatic synchronization while roaming will frequently lead to larger-than-expected data costs for the mobile device data plan.
Require signed S/MIME algorithm	This setting specifies what required algorithm must be used when signing a message.
Require signed S/MIME messages	This setting specifies whether the mobile device must send signed S/MIME messages.
Require storage card encryption	This setting specifies whether the storage card must be encrypted. Not all mobile device operating systems support storage card encryption. For more information, see your mobile device and mobile operating system documentation.
Unapproved InROM application list	This setting specifies a list of applications that cannot be run in ROM.

Mobile devices

8/3/2020 • 2 minutes to read • Edit Online

There are many different mobile phones and devices enabled for Exchange ActiveSync. These include Android phones and tablets, as well as the Apple iPhone, iPod, and iPad.

Both phone and non-phone mobile devices support Exchange ActiveSync, and in most Exchange ActiveSync documentation, we use the term *mobile device*. Unless the feature or features we're discussing require a cellular telephone signal, such as SMS message notification, the term mobile device applies to both mobile phones and other mobile devices such as tablets.

What Exchange ActiveSync does

Exchange ActiveSync is a communications protocol that enables over-the-air mobile access to email messages, scheduling data, contacts, and tasks. Exchange ActiveSync is available on third-party phones that are enabled for Exchange ActiveSync.

Exchange ActiveSync offers Direct Push technology. Direct Push uses an encrypted HTTPS connection that's established and maintained between the mobile device and the server to push new email messages and other Exchange data to the phone.

To use Direct Push with Microsoft Exchange Server 2013, your users must have a mobile device that's designed to support Direct Push.

Exchange ActiveSync features

Exchange ActiveSync provides access to many different features that enable you to enforce security policies on mobile devices. By using Exchange 2013, you can configure multiple mobile device mailbox policies and control which mobile devices can synchronize with your Exchange server. Exchange ActiveSync enables you to send a remote device wipe command that wipes all data from a mobile device in case that mobile device is lost or stolen. Users can also initiate a remote device wipe from Outlook Web App.

Exchange ActiveSync lets users generate a recovery password. This recovery password is saved on the mobile device and is used when a user forgets their password. The user generates the recovery password at the same time that they generate the device password or PIN. This recovery password can be used to unlock the mobile device. Immediately after this recovery password is used, the user will be required to create a new PIN.

POP3 and IMAP4 limitations

If your mobile device doesn't support Exchange ActiveSync, or you don't need the rich feature set that Exchange ActiveSync provides, you can use POP3 or IMAP4 to access your email on your mobile device. For more information about POP3 and IMAP4 access to your mailbox, see POP3 and IMAP4 in Exchange Server.

Configure mobile phones to access email

8/3/2020 • 2 minutes to read • Edit Online

This article is about enabling users in your organization to access their Exchange 2016 or Exchange 2019 mailboxes with their mobile devices using Exchange ActiveSync.

Prerequisites

- You've reviewed the manufacturer's documentation for the mobile phone you want to configure.
- Exchange ActiveSync is enabled in your organization.

> **NOTE**
>
> For device-specific information about setting up Exchange-based email on a phone or tablet, see Set up Office apps and email on a mobile device.

Configure a mobile phone or device to use Exchange ActiveSync

Most mobile phones and devices are capable of using Autodiscover in Exchange to configure the mobile email client to use Exchange ActiveSync. To configure an email account on most mobile devices, you'll need two pieces of information.

- The user's email address
- The user's password

If the mobile phone is unable to contact the Exchange server automatically through the Autodiscover service, you'll need to set up the mobile phone manually. Manual setup requires the user's email address and password, as well as the Exchange ActiveSync server name. In most organizations, the Exchange ActiveSync server name is the same as the Outlook on the web server name without the /owa, for example, mail.contoso.com.

Perform a remote wipe on a mobile phone

8/3/2020 • 5 minutes to read • Edit Online

Your users carry sensitive corporate information in their pockets every day. If one of them loses their mobile phone, your data can end up in the hands of another person. If one of your users loses their mobile phone, you can use the Exchange admin center (EAC) or the Exchange Management Shell to wipe their phone clean of all corporate and user information.

> **NOTE**
>
> This topic also provides instructions for how to use Outlook on the web to perform a remote wipe on a phone. The user must be signed in to Outlook on the web to perform a remote wipe.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mobile devices" entry in the Clients and mobile devices permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **NOTE**
>
> Prior to EAS v16.1, remote wipe would perform a device-level wipe, restoring the device to factory conditions. With EAS v16.1 and later, EAS also supports account-only remote wipe. In order for this to work, the client must support the EAS v16.1 protocol. If the client doesn’t support v16.1, the wipe will fail and an error will be given.

Caution

Exchange ActiveSync v16.1 supports two different remote wipe processes: A **Wipe Data** remote wipe and also an **Account Only Remote Wipe Device** remote wipe. There are important differences between how Outlook responds and how native mail apps on iOS and Android respond to these different wipe commands.

Outlook for iOS and Outlook for Android support only the **Wipe Data** command, which wipes only data within Outlook. The Outlook app will reset and all Outlook email, calendar, contacts, and file data will be removed, but no other data is wiped from the device. The **Account Only Remote Wipe Device** command is therefore redundant and is not supported by Outlook for iOS or Android.

However, if a native iOS or Android mail app is connected to Exchange and receives a **Wipe Data** command from Exchange ActiveSync, all data on the device will be wiped, including photos, personal files, and so on.

If a native iOS or Android mail app is connected to Exchange and receives an **Account Only Remote Wipe Device** command from Exchange ActiveSync, only the native mail app's Exchange ActiveSync mail, calendar, and account data are wiped.

These commands are designed to destroy data. Exercise caution when using them.

After the remote wipe command is requested by the administrator, the wipe happens within seconds of the Outlook app's next connection to Exchange.

Since Outlook for iOS and Android appears as a single mobile device association under a user's mobile devices in

Exchange, a remote wipe command will remove data and delete sync relationships from all devices running Outlook (iPhone, iPad, Android) associated with that user.

A remote wipe action deletes the synchronization profile, so when the user adds his or her account to Outlook for iOS and Android, a new Device ID is generated and reported to Exchange on-premises.

> **NOTE**
>
> If you are using Intune, you should be using Intune to trigger data removal, not Exchange. Depending on the scenario, it could be accomplished via App Protection Policy selective wipe, or Device enrollment retire/wipe commands.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the EAC to wipe a user's phone

You can use the EAC to wipe a user's phone or cancel a remote wipe that has not yet completed.

1. In the EAC, navigate to **Recipients** > **Mailboxes**.

2. Select the user, and under **Mobile Devices**, choose **View details**.

3. On the **Mobile Device Details** page, select the lost mobile device, and then select **Wipe Data** (or **Account Only Remote Wipe Device** if desired).

4. Select **Save**.

Use the Exchange Management Shell to wipe a user's phone

You can use the **Clear-MobileDevice** cmdlet in the Exchange Management Shell to wipe a user's phone.

The following command wipes the device named WM_TonySmith and sends a confirmation message to admin@contoso.com.

```
Clear-MobileDevice -Identity WM_TonySmith -NotificationEmailAddresses "admin@contoso.com"
```

If the device connects to Exchange using a mail app other than Outlook, you can use the following command to wipe only the mail app's Exchange ActiveSync mail, calendar, and account data and leave all other data on the device intact:

```
Clear-MobileDevice -AccountOnly -Identity WM_TonySmith -NotificationEmailAddresses "admin@contoso.com"
```

The **-AccountOnly** switch has no effect on Outlook devices because an account-only remote wipe is the only type of wipe that is supported by Outlook. See Clear-MobileDevice for more information.

Use Outlook on the web to wipe a user's phone

Your users can use Outlook on the web to wipe their own phones.

1. In Outlook on the web, select the **Settings** icon.

2. Under **Your app settings**, select **Mail**.

3. Under **Options**, click to expand **General** if necessary, and then select **Mobile devices**.

4. Select the mobile phone.

5. Click or tap the **Wipe Device** icon (or the **Account Only Remote Wipe Device** icon if desired).

Use the New Outlook on the web to wipe a user's phone

1. In Outlook on the web, select the **Settings** icon.

2. Click on **View All Outlook settings**.

3. Click **General**, and then select **Mobile devices**.

4. Select the mobile phone.

5. Click or tap the **Wipe Device** icon (or the **Account Only Remote Wipe Device** icon if desired).

How do you know this worked?

There are several ways to verify that the remote wipe completed.

- Run the **Clear-MobileDevice** cmdlet with the *-NotificationEmailAddresses* parameter configured. A message will be sent to the supplied email address when the remote wipe has completed.

- In the EAC, check the status of the mobile device. The status will change from **Wipe Pending** to **Wipe Successful**.

- In Outlook on the web, check the status of the mobile device. The status will change from **Wipe Pending** to **Wipe Successful**.

> **NOTE**
>
> In a Microsoft 365 or Office 365-based environment, the result of a remote device wipe is not reported back to Exchange. Even when the wipe is successful, the status will display as **Pending**.

POP3 and IMAP4 in Exchange Server

8/3/2020 • 5 minutes to read • Edit Online

Although users typically access their Exchange mailboxes by using Outlook (MAPI), Outlook on the web (formerly known as Outlook Web App), and Exchange ActiveSync, POP3 and IMAP4 are available in Exchange Server 2016 and Exchange Server 2019. To support clients that still rely on these protocols, you need to start the services, and configure the settings for POP3 and IMAP4. For detailed instructions, see the following topics:

- Enable and configure POP3 on an Exchange server
- Enable and configure IMAP4 on an Exchange server
- Configure authenticated SMTP settings for POP3 and IMAP4 clients in Exchange Server

After you enable and configure POP3 or IMAP4 on the Exchange server, you can enable or disable POP3 or IMAP4 access to specific mailboxes. For more information, see Enable or disable POP3 or IMAP4 access to mailboxes in Exchange Server.

Note: Clients connect to the POP3 and IMAP4 services in the Client Access (frontend) services on the Mailbox server. They never connect directly to the POP3 and IMAP4 backend services. For more information, see Client access protocol architecture.

POP3 and IMAP4 improvements in Exchange Server

POP3 and IMAP4 functionality in Exchange 2016 and Exchange 2019 is basically unchanged from Exchange 2013. These are the improvements in POP3 and IMAP4 as compared to Exchange 2010:

- By default, the Client Access (frontend) services in Exchange 2016 and 2019 automatically proxy POP3 and IMAP4 client connections from one Active Directory site to the correct Mailbox server in a different Active Directory site. In previous versions of Exchange, you had to perform a manual configuration step to allow POP3 and IMAP4 clients to connect to their mailboxes from one site to another.
- You can't use the Anonymous or Guest accounts to access an Exchange 2016 or Exchange 2019 mailbox by using POP3 or IMAP4. Access is blocked to prevent security vulnerabilities when you use non-standard accounts for POP3 and IMAP4 access.
- You can't connect to the Administrator mailbox by using POP3 or IMAP4 (you can use Outlook or Outlook Web App). This limitation was intentionally included in Exchange 2016 to enhance security for the Administrator mailbox.

Overview of POP3 and IMAP4 functionality

The POP3 and IMAP4 protocols have the following benefits and limitations:

- **POP3**
  - Designed for offline message processing.
  - Can only download messages from a single folder (usually the Inbox) in the mailbox to a single folder in the POP3 application on the client computer or device.
  - By default, downloaded messages are removed from the email server, and are stored only on the local computer or device. Therefore, users can't access the same email messages from multiple computers or devices (although many POP3 applications can be configured to keep copies of

downloaded messages in the mailbox on the email server).

  - Doesn't offer advanced collaboration features such as calendaring, contacts, and tasks.

- IMAP4
  - Offers offline and online message processing.
  - Can synchronize messages from multiple folders in the mailbox with the client computer or device. For example, most IMAP4 applications can be configured to keep a copy of sent messages in the mailbox on the email server.
  - By default, copies of downloaded messages remain on the email server. Therefore, users can access the same messages from multiple computers.
  - Supports additional features. For example, you can download the message headers (the message's sender and subject) before you decide to download the complete message.
  - Doesn't offer advanced collaboration features such as calendaring, contacts, and tasks.

Note: POP3 and IMAP4 clients have limited access to Exchange calendar information. For more information, see Configure Calendar Options for POP3 and Configure Calendar Options for IMAP4.

POP3 and IMAP4 applications and settings

After you've enabled and configured the required services, users can connect to their Exchange mailboxes by using any application that support POP3 and IMAP4. For example, Outlook, Windows Mail, and Mozilla Thunderbird. POP3 and IMAP4 feature support varies by application, so check the application's documentation.

Verify the POP3 or IMAP4 email program is configured to keep a copy of all messages on the server. This allows the users to access their messages from different computers or applications.

Another important setting is how frequently the email program contacts the server to send and receive mail. There are three basic settings:

- **Send and receive messages when the application is started**
- **Send and receive messages manually**: Messages are only sent and received when the user clicks a "send and receive" option in the application. This is a good setting for computers that aren't always connected to the Internet (for example, dial-up or metered Internet connections).
- **Send and receive messages every set number of minutes**: The application connects to the email server periodically to send messages and to download any new messages. This is a good setting for computers that are always connected to the Internet, because the application is kept up-to-date with the most current messages from the mailbox.

Note: If the application and server both support the IMAP4 **IDLE** command, users can send and receive messages in near real time (Exchange supports the IMAP4 **IDLE** command). In most cases, users don't need to configure any settings in their IMAP4 application to use this connection method.

To configure a POP3 or IMAP4 client to connect to a mailbox, users need specific information about the POP3 or IMAP4 settings. By default, Exchange uses the following settings for **internal** POP3 connections:

- **POP3 server FQDN**: `<ServerFQDN>`. For example, `mailbox01.contoso.com`.
- **TCP port and encryption method**: 995 for always SSL/TLS encrypted connections, and 110 for unencrypted connections, or for opportunistic TLS (**STARTTLS**) that results in an encrypted connection after the initial plain text protocol handshake.

To allow **external** POP3 clients to connect to mailboxes, you need to configure these settings for external connections. For more information, see Enable and configure POP3 on an Exchange server.

By default, Exchange uses the following settings for **internal** IMAP4 connections:

- **IMAP4 server FQDN**: `<ServerFQDN>`. For example, `mailbox01.contoso.com`.
- **TCP port and encryption method**: 993 for always SSL/TLS encrypted connections, and 143 for unencrypted connections, or for opportunistic TLS (**STARTTLS**) that results in an encrypted connection after the initial plain text protocol handshake.

To allow **external** IMAP4 clients to connect to mailboxes, you need to configure these settings for external connections. For more information, see Enable and configure IMAP4 on an Exchange server.

Enable and configure POP3 on an Exchange server

8/3/2020 • 8 minutes to read • Edit Online

By default, POP3 client connectivity isn't enabled in Exchange. To enable POP3 client connectivity, you need to perform the following steps:

1. Start the POP3 services, and configure the services to start automatically:

   - **Microsoft Exchange POP3**: This is the Client Access (frontend) service that POP3 clients connect to.

   - **Microsoft Exchange POP3 Backend**: POP3 client connections from the Client Access service are proxied to the backend service on the server that hold the active copy of the user's mailbox. For more information, see Client Access protocol architecture.

2. Configure the POP3 settings for external clients.

   By default, Exchange uses the following settings for **internal** POP3 connections:

   - **POP3 server FQDN**: `<ServerFQDN>`. For example, `mailbox01.contoso.com`.

   - **TCP port and encryption method**: 995 for always TLS encrypted connections, and 110 for unencrypted connections, or for opportunistic TLS (**STARTTLS**) that results in an encrypted connection after the initial plain text protocol handshake.

   To allow **external** POP3 clients to connect to mailboxes, you need to configure the POP3 server FQDN, TCP port, and encryption method for external connections. This step causes the external POP3 settings to be displayed in Outlook on the web (formerly known as Outlook Web App) at **Settings** > **Options** > **Mail** > **Accounts** > **POP and IMAP**.

   
   POP and IMAP settings

   Use the information on this page if you need to use POP or IMAP to connect your mailbox.

   POP setting
   Server name: mail.contoso.com
   Port: 995
   Encryption method: SSL

   IMAP setting
   Not available

   SMTP setting
   Not available

3. Restart the POP3 services to save the changes.

4. Configure the authenticated SMTP settings for internal and external clients. For more information, see Configure authenticated SMTP settings for POP3 and IMAP4 clients in Exchange Server.

For more information about POP3, see POP3 and IMAP4 in Exchange Server.

What do you need to know before you begin?

- Estimated time to complete each procedure: 5 minutes.

- Secure Sockets Layer (SSL) is being replaced by Transport Layer Security (TLS) as the protocol that's used to encrypt data sent between computer systems. They're so closely related that the terms "SSL" and "TLS" (without versions) are often used interchangeably. Because of this similarity, references to "SSL" in Exchange topics, the Exchange admin center, and the Exchange Management Shell have often been used to encompass both the SSL and TLS protocols. Typically, "SSL" refers to the actual SSL protocol only when a version is also provided (for example, SSL 3.0). To find out why you should disable the SSL protocol and switch to TLS, check out Protecting you against the SSL 3.0 vulnerability.

- To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.

- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "POP3 and IMAP4 Permissions" section in the Clients and mobile devices permissions topic.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Step 1: Start the POP3 services, and configure the services to start automatically

You can perform this step by using the Windows Services console, or the Exchange Management Shell.

Use the Windows Services console to start the POP3 services, and configure the services to start automatically

1. On the Exchange server, open the Windows Services console. For example:

   - Run the command `services.msc` from the **Run** dialog, a Command Prompt window, or the Exchange Management Shell.

   - Open Server Manager, and then click **Tools** > **Services**.

2. In the list of services, select **Microsoft Exchange POP3**, and then click **Action** > **Properties**.

3. The **Microsoft Exchange POP3 Properties** window opens. On the **General** tab, configure the following settings:

   - **Startup type**: Select **Automatic**.

   - **Service status**: Click **Start**.

   When you're finished, click **OK**.

4. In the list of services, select **Microsoft Exchange POP3 Backend**, and then click **Action** > **Properties**.

5. The **Microsoft Exchange POP3 Backend Properties** window opens. On the **General** tab, configure the following settings:

   - **Startup type**: Select **Automatic**.

   - **Service status**: Click **Start**.

   When you're finished, click **OK**.

Use the Exchange Management Shell to start the POP3 services, and configure the services to start automatically

1. Run the following command to start the POP3 services:

```
Start-Service MSExchangePOP3; Start-Service MSExchangePOP3BE
```

2. Run the following command to configure the POP3 services to start automatically:

```
Set-Service MSExchangePOP3 -StartupType Automatic; Set-Service MSExchangePOP3BE -StartupType Automatic
```

For more information about these cmdlets, see Start-Service and Set-Service.

How do you know this step worked?

To verify that you've successfully started the POP3 services, use either of the following procedures:

- On the Exchange server, open Windows Task Manager. On the **Services** tab, verify that the **Status** value for the **MSExchangePOP3** and **MSExchangePOP3BE** services is **Running**.

- In the Exchange Management Shell, run the following command to verify that the POP3 services are running:

```
Get-Service MSExchangePOP3; Get-Service MSExchangePOP3BE
```

Step 2: Use the Exchange Management Shell to configure the POP3 settings for external clients

To configure the POP3 settings for external clients, use the following syntax:

```
Set-PopSettings -ExternalConnectionSettings "<FQDN1>:<TCPPort1>:<SSL | TLS | blank>", "<FQDN2>:<TCPPort2>:<SSL
| TLS | blank>"...  -X509CertificateName <FQDN> [-SSLBindings "<IPv4Orv6Address1>:<TCPPort1>","
<IPv4Orv6Address2>:<TCPPort2>"...] [-UnencryptedOrTLSBindings "<IPv4Orv6Address1>:<TCPPort1>","
<IPv4Orv6Address2>:<TCPPort2>"...]
```

This example allows configures the following settings for external POP3 connections:

- **POP3 server FQDN**: mail.contoso.com

- **TCP port**: 995 for always TLS encrypted connections, and 110 for unencrypted connections or opportunistic TLS (STARTTLS) encrypted connections.

- **Internal Exchange server IP address and TCP port for always TLS encrypted connections**: All available IPv4 and IPv6 addresses on the server on port 995 (we aren't using the *SSLBindings* parameter, and the default value is `[::]:995,0.0.0.0:995`).

- **Internal Exchange server IP address and TCP port for unencrypted or opportunistic TLS (STARTTLS) encrypted connections**: All available IPv4 and IPv6 addresses on the server on port 110 (we aren't using the *UnencryptedOrTLSBindings* parameter, and the default value is `[::]:110,0.0.0.0:110`).

- **FQDN used for encryption**: mail.contoso.com. This value identifies the certificate that matches or contains the POP3 server FQDN.

```
Set-PopSettings -ExternalConnectionSettings "mail.contoso.com:995:SSL","mail.contoso.com:110:TLS" -
X509CertificateName mail.contoso.com
```

Notes:

- For detailed syntax and parameter information, see Set-PopSettings.

- The external POP3 server FQDN that you configure needs to have a corresponding record in your public DNS, and the TCP port (110 or 995) needs to be allowed through your firewall to the Exchange server.

- The combination of encryption methods and TCP ports that you use for the *ExternalConnectionSettings* parameter need to match the corresponding TCP ports and encryption methods that you use for the *SSLBindings* or *UnencryptedOrTLSBindings* parameters.

- Although you can use a separate certificate for POP3, we recommend that you use the same certificate as the other Exchange IIS (HTTP) services, which is likely a wildcard certificate or a subject alternative name (SAN) certificate from a commercial certification authority that's automatically trusted by all clients. For more information, see Certificate requirements for Exchange services.

- If you use a single subject certificate, or a SAN certificate, you also need to assign the certificate to the Exchange POP service. You don't need to assign a wildcard certificate to the Exchange POP service. For more information, see Assign certificates to Exchange Server services.

How you do know this step worked?

To verify that you've successfully configured the POP3 settings for external clients, run the following command in the Exchange Management Shell and verify the settings:

```
Get-PopSettings | Format-List *ConnectionSettings,*Bindings,X509CertificateName
```

For more information, see Get-POPSettings.

Step 3: Restart the POP3 services

After you enable and configure POP3, you need to restart the POP3 services on the server by using the Windows Services console, or the Exchange Management Shell.

Use the Windows Services console to restart the POP3 services

1. On the Exchange server, open the Windows Services console.

2. In the list of services, select **Microsoft Exchange POP3**, and then click **Action** > **Restart**.

3. In the list of services, select **Microsoft Exchange POP3 Backend**, and then click **Action** > **Restart**.

Use the Exchange Management Shell to restart the POP3 services

Run the following command to restart the POP3 services.

```
Restart-Service MSExchangePOP3; Restart-Service MSExchangePOP3BE
```

For more information about this cmdlet, see Restart-Service.

To verify that you've successfully restarted the POP3 services, run the following command:

```
Get-Service MSExchangePOP3; Get-Service MSExchangePOP3BE
```

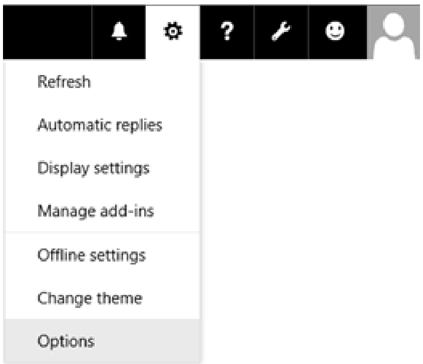
Step 4: Configure the authenticated SMTP settings for POP3 clients

Because POP3 isn't used to send email messages, you need to configure the authenticated SMTP settings that are used by internal and external POP3 clients. For more information, see POP3 and IMAP4 in Exchange Server.

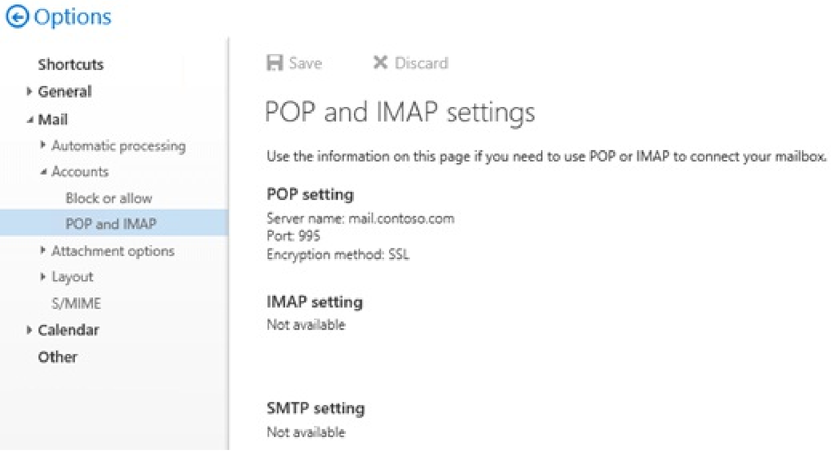
How do you know this task worked?

To verify that you have enabled and configured POP3 on the Exchange server, perform the following procedures:

1. Open a mailbox in Outlook on the web, and then click **Settings** > **Options**.



2. Click **Mail** > **Accounts** > **POP and IMAP** and verify the correct POP3 settings are displayed.



POP and IMAP settings

Use the information on this page if you need to use POP or IMAP to connect your mailbox.

POP setting
Server name: mail.contoso.com
Port: 995
Encryption method: SSL

IMAP setting
Not available

SMTP setting
Not available

Note: If you configured 995/SSL **and** 110/TLS values for the *ExternalConnectionSettings* parameter on the **Set-PopSettings** cmdlet, only the 995/SSL value is displayed in Outlook on the web. Also, if the external POP3 settings that you configured don't appear as expected in Outlook on the web after you restart the POP3 services, run the commands `net stop w3svc /y` and `net start w3svc` to restart Internet Information Services (IIS).

3. You can test POP3 client connectivity to the Exchange server by using the following methods:

- **Internal clients**: Use the **Test-PopConnectivity** cmdlet. For example,

```
Test-PopConnectivity -ClientAccessServer <ServerName> -Lightmode -MailboxCredential (Get-Credential)
```

. For more information, see Test-PopConnectivity.

Note: The *Lightmode* switch tells the command test POP3 logons to the server. To test sending (SMTP) and receiving (POP3) a message, you need to configure the authenticated SMTP settings as described in POP3 and IMAP4 in Exchange Server.

- **External clients**: Use the **POP Email** test in the Microsoft Remote Connectivity Analyzer.

Note: You can't use POP3 to connect to the Administrator mailbox. This limitation was intentionally included in Exchange 2016 and Exchange 2019 to enhance the security of the Administrator mailbox.

Next steps

To enabled or disable POP3 access to individual mailboxes, see Enable or disable POP3 or IMAP4 access to mailboxes in Exchange Server.

Enable and configure IMAP4 on an Exchange server

8/3/2020 • 8 minutes to read • Edit Online

By default, IMAP4 client connectivity isn't enabled in Exchange. To enable IMAP4 client connectivity, you need to perform the following steps:

1. Start the IMAP4 services, and configure the services to start automatically:

   - **Microsoft Exchange IMAP4**: This is the Client Access (frontend) service that IMAP4 clients connect to.

   - **Microsoft Exchange IMAP4 Backend**: IMAP4 client connections from the Client Access service are proxied to the backend service on the server that hold the active copy of the user's mailbox. For more information, see Exchange architecture.

2. Configure the IMAP4 settings for external clients.

   By default, Exchange uses the following settings for **internal** IMAP4 connections:

   - **IMAP4 server FQDN**: `<ServerFQDN>`. For example, `mailbox01.contoso.com`.

   - **TCP port and encryption method**: 993 for always TLS encrypted connections, and 143 for unencrypted connections, or for opportunistic TLS (**STARTTLS**) that results in an encrypted connection after the initial plain text protocol handshake.

   To allow **external** IMAP4 clients to connect to mailboxes, you need to configure the IMAP4 server FQDN, TCP port, and encryption method for external connections. This step causes the external IMAP4 settings to be displayed in Outlook on the web (formerly known as Outlook Web App) at **Settings** > **Options** > **Mail** > **Accounts** > **POP and IMAP**.

   
   POP and IMAP settings

   Use the information on this page if you need to use POP or IMAP to connect your mailbox.

   POP setting
   Not available

   IMAP setting
   Server name: mail.contoso.com
   Port: 993
   Encryption method: SSL

   SMTP setting
   Not available

3. Restart the IMAP4 services to save the changes.

4. Configure the authenticated SMTP settings for internal and external clients. For more information, see Configure authenticated SMTP settings for POP3 and IMAP4 clients in Exchange.

For more information about IMAP4, see POP3 and IMAP4 in Exchange Server.

What do you need to know before you begin?

- Estimated time to complete each procedure: 5 minutes.

- Secure Sockets Layer (SSL) is being replaced by Transport Layer Security (TLS) as the protocol that's used to encrypt data sent between computer systems. They're so closely related that the terms "SSL" and "TLS" (without versions) are often used interchangeably. Because of this similarity, references to "SSL" in Exchange topics, the Exchange admin center, and the Exchange Management Shell have often been used to encompass both the SSL and TLS protocols. Typically, "SSL" refers to the actual SSL protocol only when a version is also provided (for example, SSL 3.0). To find out why you should disable the SSL protocol and switch to TLS, check out Protecting you against the SSL 3.0 vulnerability.

- To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "POP3 and IMAP4 Permissions" section in the Clients and mobile devices permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

TIP

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Step 1: Start the IMAP4 services, and configure the services to start automatically

You can perform this step by using the Windows Services console, or the Exchange Management Shell.

Use the Windows Services console to start the IMAP4 services, and configure the services to start automatically

1. On the Exchange server, open the Windows Services console. For example:
   - Run the command `services.msc` from the **Run** dialog, a Command Prompt window, or the Exchange Management Shell.
   - Open Server Manager, and then click **Tools** > **Services**.
2. In the list of services, select **Microsoft Exchange IMAP4**, and then click **Action** > **Properties**.
3. The **Microsoft Exchange IMAP4 Properties** window opens. On the **General** tab, configure the following settings:
   - **Startup type**: Select **Automatic**.
   - **Service status**: Click **Start**.

   When you're finished, click **OK**.
4. In the list of services, select **Microsoft Exchange IMAP4 Backend**, and then click **Action** > **Properties**.
5. The **Microsoft Exchange IMAP4 Backend Properties** window opens. On the **General** tab, configure the following settings:
   - **Startup type**: Select **Automatic**.
   - **Service status**: Click **Start**.

   When you're finished, click **OK**.

Use the Exchange Management Shell to start the IMAP4 services, and configure the services to start

automatically

1. Run the following command to start the IMAP4 services:

   ```
   Start-Service MSExchangeIMAP4; Start-Service MSExchangeIMAP4BE
   ```

2. Run the following command to configure the IMAP4 services to start automatically:

   ```
   Set-Service MSExchangeIMAP4 -StartupType Automatic; Set-Service MSExchangeIMAP4BE -StartupType
   Automatic
   ```

For more information about these cmdlets, see Start-Service and Set-Service.

How do you know this step worked?

To verify that you've successfully started the IMAP4 services, use either of the following procedures:

- On the Exchange server, open Windows Task Manager. On the **Services** tab, verify that the **Status** value for the **MSExchangeIMAP4** and **MSExchangeIMAP4BE** services is **Running**.

- In the Exchange Management Shell, run the following command to verify that the IMAP4 services are running:

  ```
  Get-Service MSExchangeIMAP4; Get-Service MSExchangeIMAP4BE
  ```

Step 2: Use the Exchange Management Shell to configure the IMAP4 settings for external clients

To configure the IMAP4 settings for external clients, use the following syntax:

```
Set-ImapSettings -ExternalConnectionSettings "<FQDN1>:<TCPPort1>:<SSL | TLS | blank>", "<FQDN2>:<TCPPort2>:
<SSL | TLS | blank>"...  -X509CertificateName <FQDN> [-SSLBindings "<IPv4Orv6Address1>:<TCPPort1>","
<IPv4Orv6Address2>:<TCPPort2>"...] [-UnencryptedOrTLSBindings "<IPv4Orv6Address1>:<TCPPort1>","
<IPv4Orv6Address2>:<TCPPort2>"...]
```

This example allows configures the following settings for external IMAP4 connections:

- **IMAP4 server FQDN**: mail.contoso.com

- **TCP port**: 993 for always TLS encrypted connections, and 143 for unencrypted connections or opportunistic TLS (STARTTLS) encrypted connections.

- **Internal Exchange server IP address and TCP port for always TLS encrypted connections**: All available IPv4 and IPv6 addresses on the server on port 993 (we aren't using the *SSLBindings* parameter, and the default value is `[::]:993,0.0.0.0:993`).

- **Internal Exchange server IP address and TCP port for unencrypted or opportunistic TLS (STARTTLS) encrypted connections**: All available IPv4 and IPv6 addresses on the server on port 143 (we aren't using the *UnencryptedOrTLSBindings* parameter, and the default value is `[::]:143,0.0.0.0:143`).

- **FQDN used for encryption**: mail.contoso.com. This value identifies the certificate that matches or contains the IMAP4 server FQDN.

```
Set-ImapSettings -ExternalConnectionSettings "mail.contoso.com:993:SSL","mail.contoso.com:143:TLS" -
X509CertificateName mail.contoso.com
```

Notes:

- For detailed syntax and parameter information, see Set-IMAPSettings.
- The external IMAP4 server FQDN that you configure needs to have a corresponding record in your public DNS, and the TCP port (143 or 993) needs to be allowed through your firewall to the Exchange server.
- The combination of encryption methods and TCP ports that you use for the *ExternalConnectionSettings* parameter need to match the corresponding TCP ports and encryption methods that you use for the *SSLBindings* or *UnencryptedOrTLSBindings* parameters.
- Although you can use a separate certificate for IMAP4, we recommend that you use the same certificate as the other Exchange IIS (HTTP) services, which is likely a wildcard certificate or a subject alternative name (SAN) certificate from a commercial certification authority that's automatically trusted by all clients. For more information, see Certificate requirements for Exchange services.
- If you use a single subject certificate, or a SAN certificate, you also need to assign the certificate to the Exchange IMAP service. You don't need to assign a wildcard certificate to the Exchange IMAP service. For more information, see Assign certificates to Exchange Server services.

How you do know this step worked?

To verify that you've successfully configured the IMAP4 settings for external clients, run the following command in the Exchange Management Shell and verify the settings:

```
Get-ImapSettings | Format-List *ConnectionSettings,*Bindings,X509CertificateName
```

For more information, see Get-IMAPSettings.

Step 3: Restart the IMAP4 services

After you enable and configure IMAP4, you need to restart the IMAP4 services on the server by using the Windows Services console, or the Exchange Management Shell.

Use the Windows Services console to restart the IMAP4 services

1. On the Exchange server, open the Windows Services console.
2. In the list of services, select **Microsoft Exchange IMAP4**, and then click **Action** > **Restart**.
3. In the list of services, select **Microsoft Exchange IMAP4 Backend**, and then click **Action** > **Restart**.

Use the Exchange Management Shell to restart the IMAP4 services

Run the following command to restart the IMAP4 services.

```
Restart-Service MSExchangeIMAP4; Restart-Service MSExchangeIMAP4BE
```

For more information about this cmdlet, see Restart-Service.

To verify that you've successfully restarted the IMAP4 services, run the following command:

```
Get-Service MSExchangeIMAP4; Get-Service MSExchangeIMAP4BE
```

Step 4: Configure the authenticated SMTP settings for IMAP4 clients

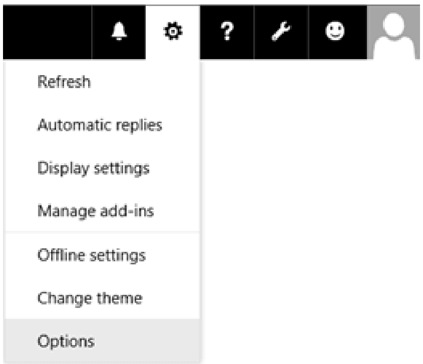
Because IMAP4 isn't used to send email messages, you need to configure the authenticated SMTP settings that are used by internal and external IMAP4 clients. For more information, see Configure authenticated SMTP settings for

POP3 and IMAP4 clients in Exchange Server.

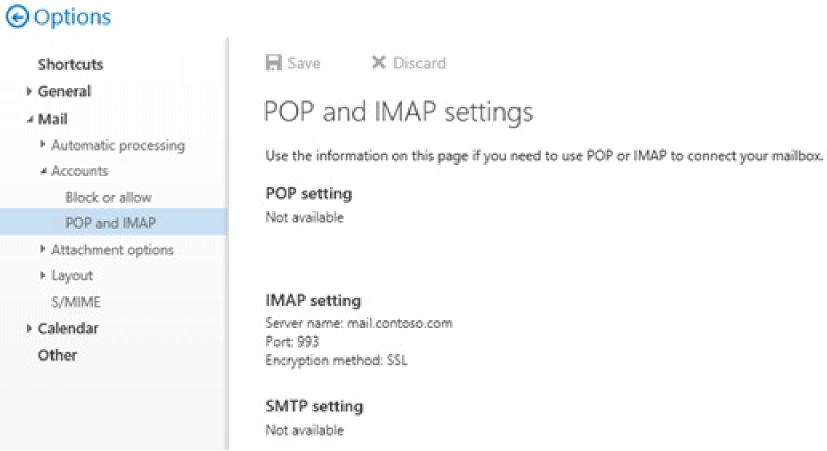
How do you know this task worked?

To verify that you have enabled and configured IMAP4 on the Exchange server, perform the following procedures:

1. Open a mailbox in Outlook on the web, and then click **Settings** > **Options**.



2. Click **Mail** > **Accounts** > **POP and IMAP** and verify the correct IMAP4 settings are displayed.



POP and IMAP settings

Use the information on this page if you need to use POP or IMAP to connect your mailbox.

POP setting
Not available

IMAP setting
Server name: mail.contoso.com
Port: 993
Encryption method: SSL

SMTP setting
Not available

Note: If you configured 993/SSL **and** 143/TLS values for the *ExternalConnectionSettings* parameter on the **Set-ImapSettings** cmdlet, only the 993/SSL value is displayed in Outlook on the web. Also, if the external IMAP4 settings that you configured don't appear as expected in Outlook on the web after you restart the IMAP4 services, run the commands `net stop w3svc /y` and `net start w3svc` to restart Internet Information Services (IIS).

3. You can test IMAP4 client connectivity to the Exchange server by using the following methods:

   - **Internal clients**: Use the **Test-ImapConnectivity** cmdlet. For example, `Test-ImapConnectivity -ClientAccessServer <ServerName> -Lightmode -MailboxCredential (Get-Credential)`. For more information, see Test-ImapConnectivity.

   Note: The *Lightmode* switch tells the command test IMAP4 logons to the server. To test sending (SMTP) and receiving (IMAP4) a message, you need to configure the authenticated SMTP settings as described in Configure authenticated SMTP settings for POP3 and IMAP4 clients in Exchange Server.

   - **External clients**: Use the **Imap Email** test in the Microsoft Remote Connectivity Analyzer.

   Note: You can't use IMAP4 to connect to the Administrator mailbox. This limitation was intentionally included in Exchange 2016 and Exchange 2019 to enhance the security of the Administrator mailbox.

Next steps

To enabled or disable IMAP4 access to individual mailboxes, see Enable or disable POP3 or IMAP4 access to mailboxes in Exchange Server.

Enable or disable POP3 or IMAP4 access to mailboxes in Exchange Server

8/3/2020 • 6 minutes to read • Edit Online

After you enable and configure POP3 or IMAP4 on an Exchange server as described in Enable and configure POP3 on an Exchange server and Enable and configure IMAP4 on an Exchange server, all user mailboxes (with the exception of the Administrator mailbox) can be accessed by using POP3 or IMAP4. You can use the procedures in this topic to disable POP3 and IMAP4 access to specific mailboxes.

For more information about POP3 and IMAP4, see POP3 and IMAP4 in Exchange Server.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.

- To open the Exchange admin center (EAC), see Exchange admin center in Exchange Server. To open the Exchange Management Shell, see Open the Exchange Management Shell.

- The procedures in this topic don't apply to the Administrator mailbox, because you can't use POP3 or IMAP4 to connect to the Administrator mailbox. This limitation was intentionally included in Exchange 2016 and Exchange 2019 to enhance the security of the Administrator mailbox.

- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Recipient provisioning permissions" section in the Recipients Permissions topic.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at Exchange Server.

Enable or disable POP3 or IMAP4 access to a single mailbox

Use the EAC to enable or disable POP3 or IMAP4 access to a mailbox

1. In the EAC, go to **Recipients** > **Mailboxes**.

2. In the list of mailboxes, find the mailbox that you want to modify. You can:

   - Scroll through the list of mailboxes.

   - Click **Search** (🔎) and enter part of the user's name, email address, or alias.

   - Click **More options** (•••) > **Advanced search** to find the mailbox.

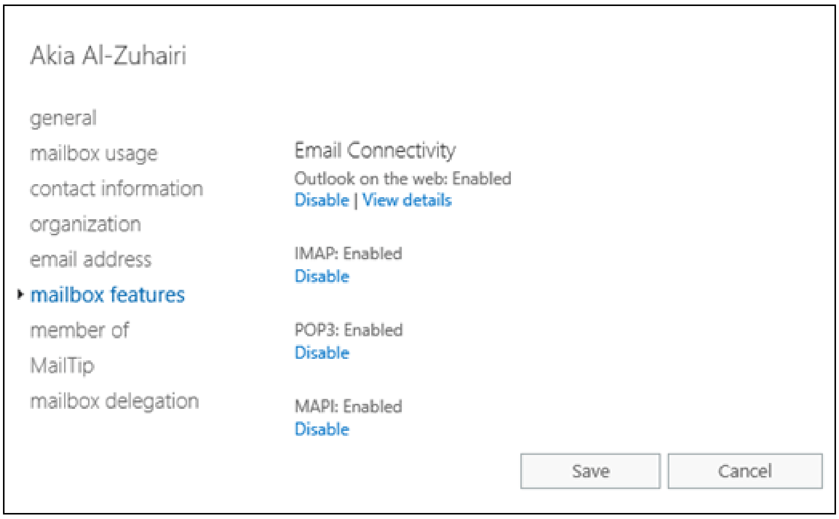
   Once you've found the mailbox that you want to modify, select it, and then click **Edit** (✎).

3. In the mailbox properties window that opens, click **Mailbox Features**.

   In the **Email connectivity** section, configure one or more of the following settings:

   - **POP3**: To disable POP3 access to the mailbox, click **Disable**, and then click **Yes** in the warning message that appears. If POP3 is already disabled, click **Enable** to enable it.

- **IMAP**: To disable IMAP4 access to the mailbox, click **Disable**, and then click **Yes** in the warning message that appears. If IMAP4 is already disabled, click **Enable** to enable it.



Akia Al-Zuhairi

Email Connectivity
Outlook on the web: Enabled

IMAP: Enabled

POP3: Enabled

MAPI: Enabled

When you're finished, click **Save**.

Use the Exchange Management Shell to enable or disable POP3 or IMAP4 access to a mailbox

To enable or disable POP3 or IMAP4 access to a single mailbox use the following syntax:

```
Set-CasMailbox -Identity <MailboxIdentity> -PopEnabled <$true | $false> -ImapEnabled <$true | $false>
```

This example disables POP3 and IMAP4 access to the mailbox named Rand Zaher.

```
Set-CasMailbox -Identity "Rand Zaher" -PopEnabled $false -ImapEnabled $false
```

This example enables POP3 and IMAP4 access to the mailbox named Rand Zaher.

```
Set-CasMailbox -Identity "Rand Zaher" -POPEnabled $true -ImapEnabled $true
```

For more information, see Set-CASMailbox.

Enable or disable POP3 or IMAP4 access to multiple mailboxes

Use the EAC to enable or disable POP3 or IMAP4 access to multiple mailboxes

1. In the EAC, go to **Recipients** > **Mailboxes**.

2. In the list of mailboxes, find the mailboxes that you want to modify. You can:

   - Scroll through the list of mailboxes.

   - Click **Search** (🔎) and enter part of the user's name, email address, or alias.

   - Click **More options** (•••) > **Advanced search** to find the mailbox.

3. In the list of mailboxes, select multiple mailboxes of the same type (for example, **User**) from the list. For example:

   - Select a mailbox, hold down the Shift key, and select another mailbox that's farther down in the list.

   - Hold down the CTRL key as you select each mailbox.

After you select multiple mailboxes of the same type, the title of the details pane changes to **Bulk Edit**.

4. In the details pane, go to **POP3** or **IMAP**, click **Enable** or **Disable**, and then click **OK** in the warning message that appears.

Use the Exchange Management Shell to enable or disable POP3 or IMAP4 access to multiple mailboxes

You can use the **Get-Mailbox**, **Get-User**, or **Get-Content** cmdlets to identify the mailboxes that you want to modify. For example:

- Use the *OrganizationalUnit* parameter to filter the mailboxes by organizational unit (OU).

- Use the *Filter* parameter to create OPATH filters that identify the mailboxes. For more information, see Filterable Properties for the -Filter Parameter.

- Use a text file to specify the mailboxes. The text file contains one mailbox (email address, name, or other unique identifier) on each line like this:

> ebrunner@tailspintoys.com
> fapodaca@tailspintoys.com
> glaureano@tailspintoys.com
> hrim@tailspintoys.com

This example disables POP3 and IMAP4 access to all user mailboxes in the North America\Finance OU.

```
$NAFinance = Get-Mailbox -OrganizationalUnit "OU=Marketing,OU=North America,DC=contoso,DC=com" -Filter
"RecipientTypeDetails -eq 'UserMailbox'" -ResultSize Unlimited; $NAFinance | foreach {Set-CasMailbox
$_.Identity -PopEnabled $false -ImapEnabled $false}
```

This example disables POP3 and IMAP4 access to all mailboxes in the Engineering department in Washington state.

```
Get-User -Filter "RecipientType -eq 'UserMailbox' -and Department -like 'Engineering*' -and StateOrProvince -
eq 'WA'" | Set-CasMailbox -PopEnabled $false -ImapEnabled $false
```

This example uses the text file C:\My Documents\Accounts.txt to disable POP3 or IMAP4 access to the specified mailboxes.

```
Get-Content "C:\My Documents\Accounts.txt" | foreach {Set-CASMailbox $_ -PopEnabled $false -ImapEnabled $false}
```

For more information, see Get-Mailbox and Get-User.

Restart the POP3 or IMAP4 services

After you change the POP3 or IMAP4 access settings on a mailbox, you need to restart the POP3 and IMAP4 services on the server. You can do this by using the Windows Services console, or the Exchange Management Shell.

Use the Windows Services console to restart the POP3 or IMAP4 services

1. On the Exchange server, open the Windows Services console. For example:

   - Run the command `services.msc` from the **Run** dialog, a Command Prompt window, or the Exchange Management Shell.

   - Open Server Manager, and then click **Tools** > **Services**.

2. In the list of services, do one or both of the following actions:

   - **POP3**:

     a. Select **Microsoft Exchange POP3**, and then click **Action** > **Restart**.

     b. Select **Microsoft Exchange POP3 Backend**, and then click **Action** > **Restart**.

   - **IMAP4**:

     a. Select **Microsoft Exchange IMAP4**, and then click **Action** > **Restart**.

     b. Select **Microsoft Exchange IMAP4 Backend**, and then click **Action** > **Restart**.

Use the Exchange Management Shell to restart the POP3 or IMAP4 services

To restart the POP3 services, run the following command:

```
Restart-Service MSExchangePOP3; Restart-Service MSExchangePOP3BE
```

To restart the IMAP4 services, run the following command:

```
Restart-Service MSExchangeIMAP4; Restart-Service MSExchangeIMAP4BE
```

For more information about this cmdlet, see Restart-Service.

To verify that you've successfully restarted the POP3 or IMAP4 services, run the following command:

```
Get-Service MSExchangePOP3; Get-Service MSExchangePOP3BE; Get-Service MSExchangeIMAP4; Get-Service MSExchangeIMAP4BE
```

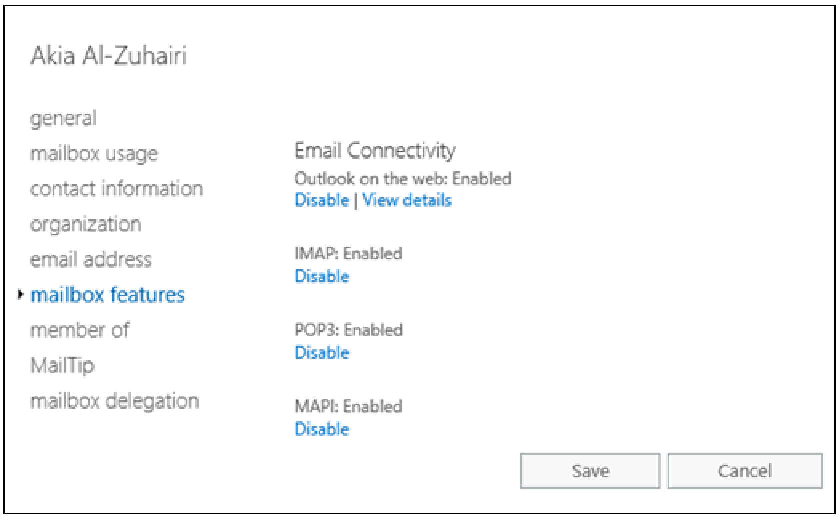
How do you know this worked?

To verify that you've enabled or disabled POP3 or IMAP4 access to a mailbox, use any of the following procedures:

- In the EAC, go to **Recipients** > **Mailboxes** > select the mailbox > click **Edit** ✎ > **Mailbox features** > **Email connectivity**.

- If POP3 access is enabled for the mailbox, you'll see **POP3: Enabled** and the **Disable** link. If POP3 access is disabled, you'll see **POP3: Disabled** and the **Enable** link.

- If IMAP4 access is enabled for the mailbox, you'll see **IMAP4: Enabled** and a **Disable** link. If IMAP4 access is disabled, you'll see **IMAP4: Disabled** and the **Enable** link.



Akia Al-Zuhairi

Email Connectivity

Outlook on the web: Enabled
Disable | View details

IMAP: Enabled
Disable

POP3: Enabled
Disable

MAPI: Enabled
Disable

- In the Exchange Management Shell, replace *<MailboxIdentity>* with the identity of the mailbox (for example, name, alias, or email address), and run the following command:

```
Get-CasMailbox - Identity <MailboxIdentity>
```

- Use the same filter that you used to identify the mailboxes, but use the **Get-CasMailbox** cmdlet instead of **Set-CasMailbox**. For example:

```
Get-User -Filter "RecipientType -eq 'UserMailbox' -and Department -like 'Engineering*' -and
StateOrProvince -eq 'WA'" | Get-CasMailbox
```

- In the Exchange Management Shell, run this command to show all mailboxes where POP3 and IMAP4 access is disabled:

```
Get-CasMailbox -ResultSize unlimited -Filter "PopEnabled -eq `$false -and ImapEnabled -eq `$false"
```

Configure authenticated SMTP settings for POP3 and IMAP4 clients in Exchange Server

8/3/2020 • 6 minutes to read • Edit Online

After you enable and configure POP3 or IMAP4 on an Exchange server as described in Enable and configure POP3 on an Exchange server and Enable and configure IMAP4 on an Exchange server, you need to configure the authenticated SMTP settings for POP3 and IMAP4 clients so they can send email messages.

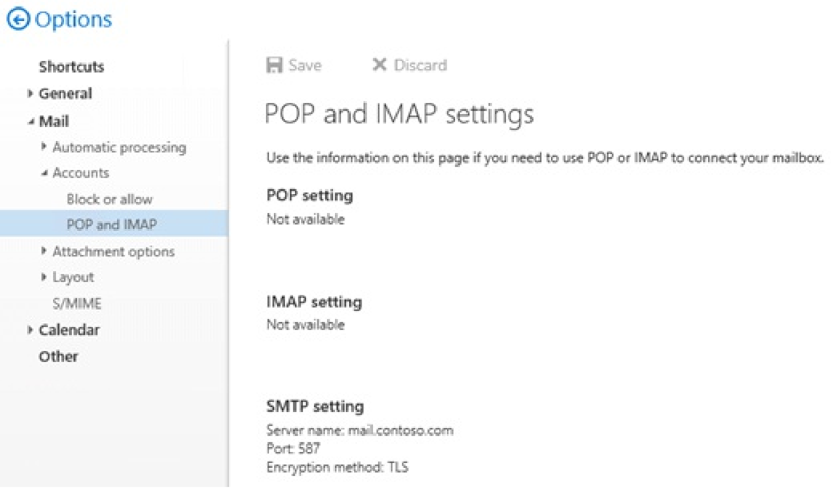
The default Receive connector named "Client Frontend *<Server name>*" in the Client Access services on the Mailbox server listens for authenticated SMTP client submissions on port 587. By default, this connector uses the following settings for **internal and external** client (authenticated) SMTP connections:

- **SMTP server**: `<ServerFQDN>`. For example, `mailbox01.contoso.com`.
- **TCP port**: 587
- **Encryption method**: TLS. Note that this is opportunistic TLS (**STARTTLS**) that results in an encrypted connection after the initial plain text protocol handshake.

For more information, see Default Receive connectors created during setup and Client access protocol architecture.

To configure the authenticated SMTP settings that are used by POP3 and IMAP4 clients, perform the following steps:

1. Configure the FQDN on the "Client Frontend *<Server name>*" Receive connector.
2. Specify the certificate that's used to encrypt authenticated SMTP client connections.
3. Configure Outlook on the web (formerly known as Outlook Web App) to display the SMTP settings for authenticated SMTP clients at **Settings** > **Options** > **Mail** > **Accounts** > **POP and IMAP**.



POP and IMAP settings

Use the information on this page if you need to use POP or IMAP to connect your mailbox.

POP setting
Not available

IMAP setting
Not available

SMTP setting
Server name: mail.contoso.com
Port: 587
Encryption method: TLS

For more information about POP3 and IMAP4, see POP3 and IMAP4 in Exchange Server.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- Secure Sockets Layer (SSL) is being replaced by Transport Layer Security (TLS) as the protocol that's used

to encrypt data sent between computer systems. They're so closely related that the terms "SSL" and "TLS" (without versions) are often used interchangeably. Because of this similarity, references to "SSL" in Exchange topics, the Exchange admin center, and the Exchange Management Shell have often been used to encompass both the SSL and TLS protocols. Typically, "SSL" refers to the actual SSL protocol only when a version is also provided (for example, SSL 3.0). To find out why you should disable the SSL protocol and switch to TLS, check out Protecting you against the SSL 3.0 vulnerability.

- If you have POP3 or IMAP4 clients that can only send SMTP email on port 25, you can configure port 25 on the "Client Frontend *<Server name>*" Receive connector to allow clients to send authenticated SMTP email. However, because port 25 is also configured on the "Client Frontend *<Server name>*" Receive connector for email from external SMTP servers, you'll need to modify the local IP addresses that are used to listen on port 25 on one or both of the connectors. For more information, see Receive connector local address bindings.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Receive connectors" entry in the Mail flow permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Step 1: Configure the FQDN on the "Client Frontend <Server name>" Receive connector

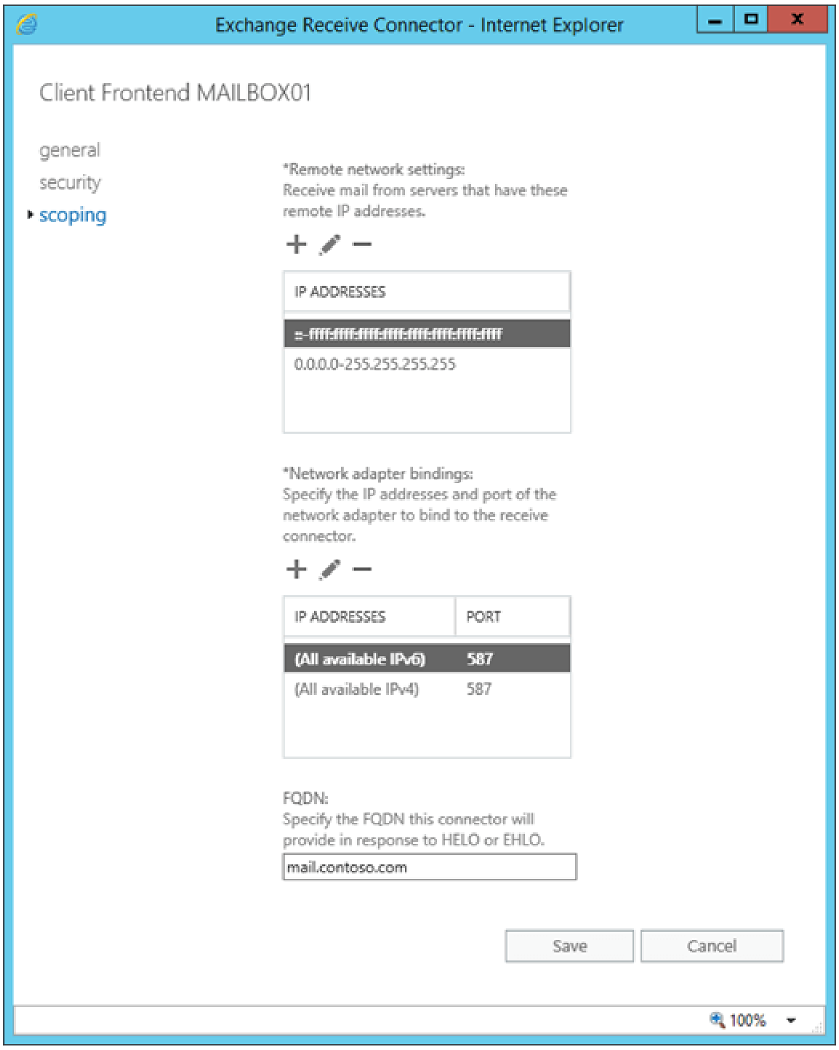
You can skip this step if you want to keep the default server FQDN value (for example, mailbox01.contoso.com). Or, you can specify an FQDN value that's more compatible with your Internet naming convention or a TLS certificate that you want to use.

If you change the FQDN value, and you want internal POP3 or IMAP4 clients to use this connector to send email, the new FQDN needs to have a corresponding record in your internal DNS.

Regardless of the FQDN value, if you want external POP3 or IMAP4 clients to use this connector to send email, the FQDN needs to have a corresponding record in your public DNS, and the TCP port (587) needs to be allowed through your firewall to the Exchange server.

Use the EAC to configure the FQDN for authenticated SMTP clients

1. In the EAC, go to **Mail flow** > **Receive connectors**.
2. In the list of Receive connectors, select **Client Frontend <Server name>**, and then click **Edit** (✏).
3. In the **Exchange Receive Connector** page that opens, click **Scoping**.
4. In the **FQDN** field, enter the SMTP server FQDN that you want to use for authenticated SMTP client connections (for example, mail.contoso.com) and then click **Save**.



Client Frontend MAILBOX01

*Remote network settings:
Receive mail from servers that have these remote IP addresses.

IP ADDRESSES
::-ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff
0.0.0.0-255.255.255.255

*Network adapter bindings:
Specify the IP addresses and port of the network adapter to bind to the receive connector.

IP ADDRESSES	PORT
(All available IPv6)	587
(All available IPv4)	587

FQDN:
Specify the FQDN this connector will provide in response to HELO or EHLO.
mail.contoso.com

Use the Exchange Management Shell to configure the FQDN for authenticated SMTP clients

To configure the FQDN for authenticated SMTP clients, use the following syntax:

```
Get-ReceiveConnector -Identity "Client Frontend*" | Set-ReceiveConnector -Fqdn <FQDN>
```

This example configures the FQDN value mail.contoso.com.

```
Get-ReceiveConnector -Identity "Client Frontend*" | Set-ReceiveConnector -Fqdn mail.contoso.com
```

How do you know this step worked?

To verify that you've successfully the FQDN on the "Client Frontend *<Server name>* " Receive connector, use either of the following procedures:

- the EAC, go to **Mail flow** > **Receive connectors** > select **Client Frontend <Server name>**, click **Edit** (✎) > **Scoping**, and verify the value in the **FQDN** field.

- In the Exchange Management Shell, run the following command:

```
Get-ReceiveConnector -Identity "Client Frontend*" | Format-List Name,Fqdn
```

Step 2: Use the Exchange Management Shell to specify the certificate that's used to encrypt authenticated SMTP client connections

The certificate needs to match or contain the FQDN value that you specified in the previous step, and the POP3 and SMTP clients need to trust the certificate, which likely means a certificate from a commercial certification authority. For more information, see Certificate requirements for Exchange services.

Also, you need to assign the certificate to the Exchange SMTP service. For more information, see Assign certificates to Exchange Server services.

To specify the certificate that's used for authenticated SMTP client connections, use the following syntax:

```
$TLSCert = Get-ExchangeCertificate -Thumbprint <ThumbprintValue>
```

```
$TLSCertName = "<I>$($TLSCert.Issuer)<S>$($TLSCert.Subject)"
```

```
Get-ReceiveConnector -Identity "Client Frontend*" | Set-ReceiveConnector -TlsCertificateName $TLSCertName
```

This example uses the certificate that has the thumbprint value 434AC224C8459924B26521298CE8834C514856AB.

```
$TLSCert = Get-ExchangeCertificate -Thumbprint 434AC224C8459924B26521298CE8834C514856AB
```

```
$TLSCertName = "<I>$($TLSCert.Issuer)<S>$($TLSCert.Subject)"
```

```
Get-ReceiveConnector -Identity "Client Frontend*" | Set-ReceiveConnector -TlsCertificateName $TLSCertName
```

How do you know this step worked?

To verify that you've specified the certificate that's used to encrypt authenticated SMTP client connections, perform the following steps:

1. Run the following command in the Exchange Management Shell:

```
Get-ReceiveConnector -Identity "Client Frontend*" | Format-List Name,Fqdn,TlsCertificateName
```

2. Run the following command in the Exchange Management Shell:

```
Get-ExchangeCertificate | Format-List Thumbprint,Issuer,Subject,CertificateDomains,Services
```

3. Verify the **Subject** or **CertificateDomains** field of the certificate that you specified on the Receive connector contains the **Fqdn** value of the Receive connector (exact match or wildcard match).

Step 3: Use the Exchange Management Shell to configure Outlook on the web to display the SMTP settings for authenticated SMTP clients

To configure Outlook on the web to display the SMTP settings server for authenticated SMTP clients, run the following command:

```
Get-ReceiveConnector -Identity "Client Frontend*" | Set-ReceiveConnector -AdvertiseClientSettings $true
```

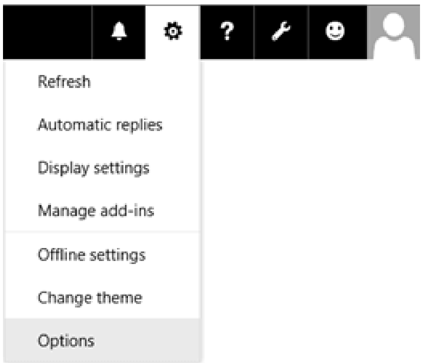
Note: To prevent the SMTP settings from being displayed in Outlook on the web, change the value from `$true` to

`$false`.

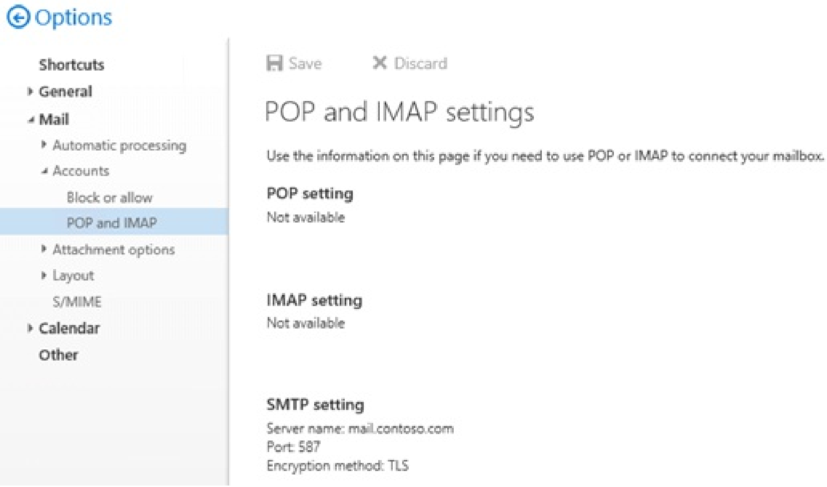
How do you know this step worked?

To verify that you've configured Outlook on the web to display the SMTP settings for authenticated SMTP clients, perform the following steps:

1. Open a mailbox in Outlook on the web, and then click **Settings** > **Options**.



2. Click **Mail** > **Accounts** > **POP and IMAP** and verify the correct SMTP settings are displayed.



POP and IMAP settings

Use the information on this page if you need to use POP or IMAP to connect your mailbox.

POP setting
Not available

IMAP setting
Not available

SMTP setting
Server name: mail.contoso.com
Port: 587
Encryption method: TLS

Note: If the SMTP settings that you configured don't appear as expected in Outlook on the web, run the commands `net stop w3svc /y` and `net start w3svc` to restart Internet Information Services (IIS).

How do you know this task worked?

To verify that you've configured the authenticated SMTP settings on the Exchange server, perform one or more following procedures:

- Use the **Test-PopConnectivity** or **Test-ImapConnectivity** cmdlets, which use authenticated SMTP to send test messages. For more information, see Test-PopConnectivity and Test-ImapConnectivity.

- Enable protocol logging on the "Client Frontend *<Server name>*" Receive connector, configure a POP3 or IMAP4 client to connect to a mailbox, send a test message from an internal network connection and/or an external Internet connection, and view the results in the protocol log. For more information, see Protocol logging.

  Note: You can't use POP3 or IMAP4 to connect to the Administrator mailbox. This limitation was intentionally included in Exchange 2016 and Exchange 2019 to enhance the security of the Administrator mailbox.

Outlook for iOS and Android

8/3/2020 • 2 minutes to read • Edit Online

Outlook for iOS and Android supports two authentication types in Exchange on-premises environments: *Basic authentication* and *hybrid Modern Authentication*.

Outlook for iOS and Android uses Basic authentication with Exchange ActiveSync in the following environments:

- In Exchange Server 2010 environments
- When a hybrid relationship with Microsoft 365 or Office 365 has not been configured
- When hybrid Modern Authentication has not been enabled

For more information see Using Basic authentication with Outlook for iOS and Android.

For customers running Exchange Server 2013, Exchange Server 2016, or Exchange Server 2019 in a hybrid relationship with Microsoft 365 or Office 365, Outlook for iOS and Android can be configured to leverage hybrid Modern Authentication. For more information, see Using hybrid Modern Authentication with Outlook for iOS and Android.

> **NOTE**
>
> The Outlook for iOS and Android Help Center is available for users, including help for using the app on specific devices and troubleshooting information.

Using hybrid Modern Authentication with Outlook for iOS and Android

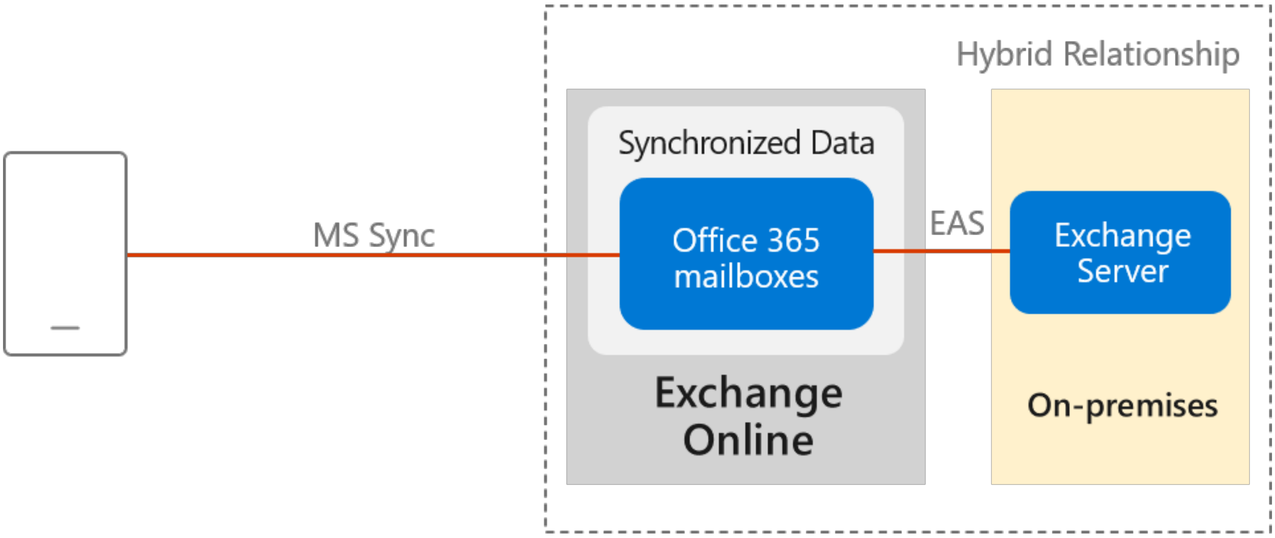
8/3/2020 • 25 minutes to read • Edit Online

The Outlook app for iOS and Android is designed as the best way to experience Microsoft 365 or Office 365 on your mobile device by leveraging Microsoft services to help find, plan, and prioritize your daily life and work. Outlook provides the security, privacy, and support you need while protecting corporate data via capabilities such as Azure Active Directory conditional access and Intune app protection policies. The following sections provide an overview of the hybrid Modern Authentication architecture, the required pre-requisites for its deployment, and how to securely deploy Outlook for iOS and Android for Exchange on-premises mailboxes.

Microsoft Cloud architecture for hybrid Exchange Server customers

Outlook for iOS and Android is a cloud-backed application. This means your experience consists of a locally installed app powered by a secure and scalable service running in the Microsoft Cloud.

For Exchange Server mailboxes, Outlook for iOS and Android's architecture is built directly into the Microsoft Cloud, providing customers the additional benefits of security, privacy, built-in compliance, and transparent operations that Microsoft commits to in the Microsoft Trust Center and Azure Trust Center.



Within the Microsoft 365 or Office 365-based architecture, Outlook for iOS and Android utilizes the native Microsoft sync technology for data synchronization which is protected by a TLS-secured connection end-to-end, between Microsoft 365 or Office 365 and the app.

The Exchange ActiveSync (EAS) connection between Exchange Online and the on-premises environment enables synchronization of the users' on-premises data and includes four weeks of email, all calendar data, all contact data, and out-of-office status in your Exchange Online tenant. This data will be removed automatically from Exchange Online after 30 days when the account is deleted in Azure Active Directory.

Data synchronization between the on-premises environment and Exchange Online happens independent of user behavior. This ensures that we can send new messages to the devices very quickly.

Processing information in the Microsoft Cloud enables advanced features and capabilities, such as the categorization of email for the Focused Inbox, customized experience for travel and calendar, and improved search speed. Relying on the cloud for intensive processing and minimizing the resources required from users' devices enhances the app's performance and stability. Lastly, it allows Outlook to build features that work across all email accounts, regardless of the technological capabilities of the underlying servers (such as different versions of Exchange Server, Microsoft 365, or Office 365).

Specifically, this new architecture has the following improvements:

1. **Enterprise Mobility + Security support**: Customers can take advantage of Microsoft Enterprise Mobility + Security (EMS) including Microsoft Intune and Azure Active Directory Premium, to enable conditional access and Intune app protection policies, which control and secure corporate messaging data on the mobile device.

2. **Fully powered by Microsoft Cloud**: The on-premises mailbox data is synchronized into Exchange Online, which provides the benefits of security, privacy, compliance and transparent operations that Microsoft commits to in the Microsoft Trust Center.

3. **OAuth protects users' passwords**: Outlook leverages hybrid Modern Authentication (OAuth) to protect users' credentials. Hybrid Modern Authentication provides Outlook with a secure mechanism to access the Exchange data without ever touching or storing a user's credentials. At sign in, the user authenticates directly against an identity platform (either Azure Active Directory or an on-premises identity provider like ADFS) and receives an access token in return, which grants Outlook access to the user's mailbox or files. At no time does the service have access to the user's password.

4. **Provides Unique Device IDs**: Each Outlook connection is uniquely registered in Microsoft Intune and can therefore be managed as a unique connection.

5. **Unlocks new features on iOS and Android**: This update enables the Outlook app to take advantage of native Microsoft 365 or Office 365 features that are not supported in Exchange on-premises today, such as leveraging full Exchange Online search and Focused Inbox. These features will only be available when using Outlook for iOS and Android.

> **NOTE**
>
> Device management through the on-premises Exchange admin center (EAC) is not possible. Intune is required to manage mobile devices.

Data security, access, and auditing controls

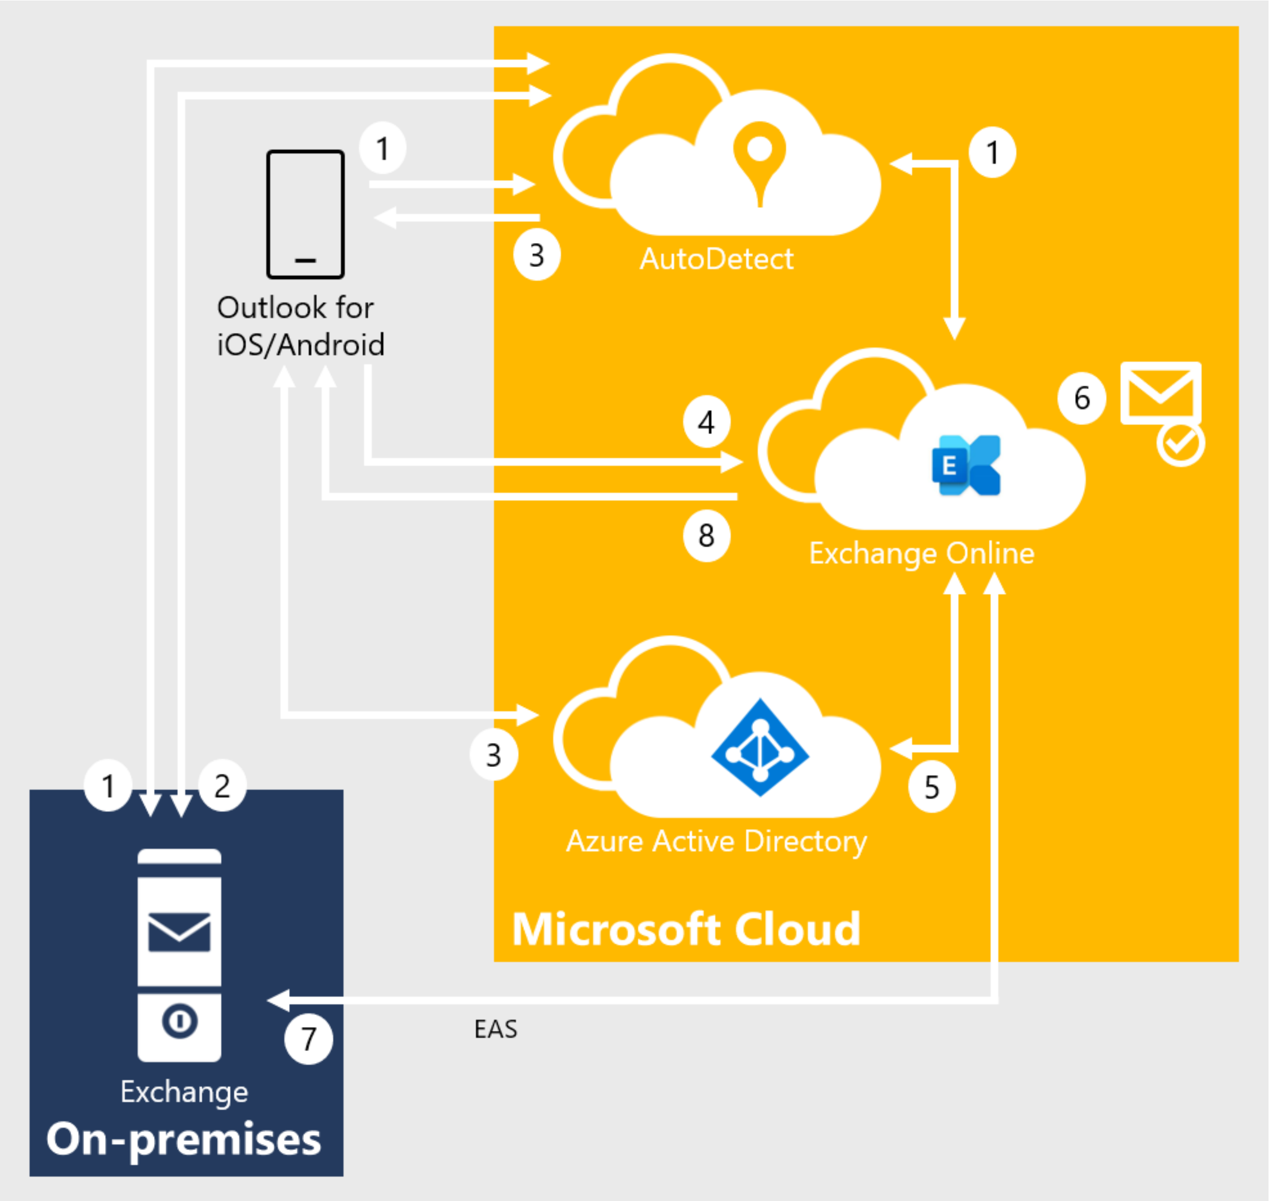
With on-premises data being synchronized with Exchange Online, customers have questions about how the data is protected in Exchange Online. Encryption in the Microsoft Cloud discusses how BitLocker is used for volume-level encryption. Service Encryption with Customer Key is supported in the Outlook for iOS and Android architecture, but note that the user must have an Office 365 Enterprise E5 license (or the corresponding versions of those plans for Government or Education) to have an encryption policy assigned using the set-mailuser cmdlet.

By default, Microsoft engineers have zero standing administrative privileges and zero standing access to customer content in Microsoft 365 or Office 365. Administrative Access Controls discusses personnel screening, background checks, Lockbox and Customer Lockbox, and more.

ISO Audited Controls on Service Assurance documentation provides the status of audited controls from global information security standards and regulations that Microsoft 365 and Office 365 have implemented.

Connection flow

When Outlook for iOS and Android is enabled with hybrid Modern Authentication, the connection flow is as follows.



1. After the user enters their email address, Outlook for iOS and Android connects to the AutoDetect service. AutoDetect determines the mailbox type by initiating an AutoDiscover query to Exchange Online. Exchange Online determines that the user's mailbox is on-premises and returns a 302-redirect to AutoDetect with the on-premises Autodiscover URL. AutoDetect initiates a query against the on-premises AutoDiscover service to determine the ActiveSync endpoint for the email address. The URL attempted on-premises is similar to this example: https://autodiscover.contoso.com/autodiscover/autodiscover.json?Email=test%40contoso.com&Protocol=activesync&RedirectCount=3.

2. AutoDetect initiates a connection to the on-premises ActiveSync URL returned in Step 1 above with an empty bearer challenge. The empty bearer challenge tells the on-premises ActiveSync that the client supports Modern Authentication. On-premises ActiveSync responds with a 401-challenge response and includes the *WWW-Authenticate: Bearer* header. Within the WWW-Authenticate: Bearer header is the authorization_uri value that identifies the Azure Active Directory (AAD) endpoint that should be used to obtain an OAuth token.

3. AutoDetect returns the AAD endpoint to the client. The client begins the log-in flow and the user is presented with a Web form (or redirected to the Microsoft Authenticator app) and can enter credentials. Depending on the identity configuration, this may or may not involve a federated endpoint redirect to an on-premises identity provider. Ultimately, the client obtains an access-and-refresh token pair, which is named AT1/RT1. This access token is scoped to the Outlook for iOS and Android client with an audience of the Exchange Online endpoint.

4. Outlook for iOS and Android establishes a connection to Exchange Online and issues a provisioning request which includes the user's access token (AT1) and the on-premises ActiveSync endpoint.

5. The MRS provisioning API within Exchange Online utilizes AT1 as input and obtains a second access-and-refresh token pair (named AT2/RT2) to access the on-premises mailbox via an on-behalf-of call to Active Directory. This second access token is scoped with the client being Exchange Online and an audience of the on-premises ActiveSync namespace endpoint.

6. If the mailbox is not provisioned, then the provisioning API creates a mailbox.

7. The MRS provisioning API establishes a secure connection to the on-premises ActiveSync endpoint and synchronizes the user's messaging data using the AT2 access token as the authentication mechanism. RT2 is used periodically to generate a new AT2 so that data can be synchronized in the background without user intervention.

8. Data is returned to the client.

Technical and licensing requirements

The hybrid Modern Authentication architecture has the following technical requirements:

> **NOTE**
>
> On-premises accounts leveraging hybrid Modern Authentication with Outlook mobile are not supported with Office 365 US Government Community and Defense tenants, Office 365 Germany tenants, and Office 365 China operated by 21Vianet tenants.

1. **Exchange on-premises setup**:

   - Exchange Server 2019 Cumulative Update 1 (CU1) or later, Exchange Server 2016 Cumulative Update 8 (CU8) or later, or Exchange Server 2013 CU19 or later on all Exchange servers. In hybrid deployments (on-premises Exchange and Exchange Online) or in organizations that use Exchange Online Archiving (EOA) with their on-premises Exchange deployment, you need to deploy the most current CU or one CU prior to the most current.

   - All Exchange 2007 or Exchange 2010 servers must be removed from the environment. These versions of Exchange are out of mainstream support and will not work with Intune-managed Outlook for iOS and Android. In this architecture, Outlook for iOS and Android uses OAuth as the authentication mechanism. One of the on-premises configuration changes that occurs enables the OAuth endpoint to the Microsoft Cloud as the default authorization endpoint. When this change is made, clients can start negotiating the use of OAuth. Because this is an organization-wide change, Exchange 2010 mailboxes fronted by either Exchange 2013 or 2016 will incorrectly think they can perform OAuth and will end up in a disconnected state, since Exchange 2010 does not support OAuth as an authentication mechanism.

2. **Active Directory Synchronization**. Active Directory synchronization of the entire on-premises mail recipient directory with Azure Active Directory, via Azure AD Connect. If you have **Azure AD app and attribute filtering** enabled in Azure AD Connect configuration, ensure that the following applications are selected:

   - Office 365 ProPlus

   - Exchange Online

   - Azure RMS

   - Intune

If you do not have **Azure AD app and attribute filtering** enabled in Azure AD Connect configuration, all required applications are already selected by default.

> **IMPORTANT**
>
> Outlook for iOS and Android uses the tenant's Exchange Online Global Address List for on-premises mailboxes that leverage hybrid Modern Authentication. If all mail recipients are not synchronized into Azure Active Directory, users will experience mail flow issues.

3. **Exchange hybrid setup**: Requires full hybrid relationship between Exchange on-premises with Exchange Online.

    - A hybrid Microsoft 365 or Office 365 organization is configured in full hybrid configuration using Exchange Classic Hybrid Topology mode and is set up as specified in the Exchange Deployment Assistant.

        > **NOTE**
        >
        > Hybrid Modern Authentication is not supported with the Hybrid Agent.

    - Requires a Microsoft 365 or Office 365 Enterprise, Business, or Education organization.
    - The on-premises mailbox data is synchronized in the same datacenter region where that Microsoft 365 or Office 365 organization is set up. For more information about where Microsoft 365 and Office 365 data is located, visit the Microsoft Trust Center.
    - The external URL host names for Exchange ActiveSync and AutoDiscover must be published as service principals to Azure Active Directory through the Hybrid Configuration Wizard.
    - AutoDiscover and Exchange ActiveSync namespaces must be accessible from the Internet and cannot be fronted by a pre-authentication solution.
    - Ensure SSL or TLS offloading is not being used between the load balancer and your Exchange servers, as this will affect the use of the OAuth token. SSL and TLS bridging (termination and re-encryption) is supported.

4. **Intune setup**: Both Intune standalone and Co-Management deployments are supported (Basic Mobility and Security for Microsoft 365 is not supported).

5. **Microsoft 365 and Office 365 licensing**:

    - Outlook for iOS and Android is free for consumer usage from the iOS App store and from Google Play. However, commercial users require a Microsoft 365 or Office 365 subscription that includes the Office desktop applications: Microsoft 365 Apps for Business, Microsoft 365 Business Standard, Microsoft 365 Apps for enterprise, Office 365 Enterprise E3, Office 365 Enterprise E5, or the corresponding versions of those plans for Government or Education. Commercial users with the following subscriptions are allowed to use the Outlook mobile app on devices with integrated screens 10.1" diagonally or less: Office 365 Enterprise E1, Office 365 F1, Office 365 A1, Microsoft 365 Business Basic, and if you only have an Exchange Online license (without Office). If you only have an Exchange on-premises (Exchange Server) license, you are not licensed to use the app.
    - Use of advanced Exchange Online features (e.g., Service Encryption with Customer Key or Multi-Geo Capabilities) require the on-premises user to be assigned the applicable Office 365 or Microsoft 365 subscription license within the Microsoft 365 Admin Center.

    For more information on how to assign a license, see [Add users individually or in bulk] (https://docs.microsoft.com/microsoft-365/admin/add-users/add-users.

6. **EMS licensing**: Each on-premises user must have one of the following licenses:

   - Intune standalone + Azure Active Directory Premium 1 or Azure Active Directory Premium 2
   - Enterprise Mobility + Security E3, Enterprise Mobility + Security E5

Implementation steps

Enabling support for hybrid Modern Authentication in your organization requires each of the following steps, which are detailed in the following sections:

1. Create a conditional access policy
2. Create an Intune app protection policy
3. Enable hybrid Modern Authentication

Create a conditional access policy

When an organization decides to standardize how users access Exchange data, using Outlook for iOS and Android as the only email app for end users, they can configure a conditional access policy that blocks other mobile access methods. Outlook for iOS and Android authenticates via the Azure Active Directory identity object and then connects to Exchange Online. Therefore, you will need to create Azure Active Directory conditional access policies to restrict mobile device connectivity to Exchange Online. To do this, you will need two conditional access policies, with each policy targeting all potential users. Details on creating these policies can be found in Require app protection policy for cloud app access with Conditional Access.

1. Follow "Step 1: Configure an Azure AD Conditional Access policy for Microsoft 365 or Office 365" in Scenario 1: Microsoft 365 and Office 365 apps require approved apps with app protection policies, which allows Outlook for iOS and Android, but blocks OAuth capable Exchange ActiveSync clients from connecting to Exchange Online.

   > **NOTE**
   >
   > This policy ensures mobile users can access all Office endpoints using the applicable apps.

2. Follow "Step 2: Configure an Azure AD Conditional Access policy for Exchange Online with ActiveSync (EAS)" in Scenario 1: Microsoft 365 and Office 365 apps require approved apps with app protection policies, which prevents Exchange ActiveSync clients leveraging basic authentication from connecting to Exchange Online.

   The above policies leverage the grant control Require app protection policy, which ensures that an Intune App Protection Policy is applied to the associated account within Outlook for iOS and Android prior to granting access. If the user isn't assigned to an Intune App Protection Policy, isn't licensed for Intune, or the app isn't included in the Intune App Protection Policy, then the policy prevents the user from obtaining an access token and gaining access to messaging data.

3. Finally, follow How to: Block legacy authentication to Azure AD with Conditional Access to block legacy authentication for other Exchange protocols on iOS and Android devices; this policy should target only Microsoft 365 or Office 365 Exchange Online cloud app and iOS and Android device platforms. This ensures mobile apps using Exchange Web Services, IMAP4, or POP3 protocols with basic authentication cannot connect to Exchange Online.

IMPORTANT

To leverage app-based conditional access policies, the Microsoft Authenticator app must be installed on iOS devices. For Android devices, the Intune Company Portal app is required. For more information, see App-based conditional access with Intune.

In order to block other mobile device clients (such as the native mail client included in the mobile operating system) from connecting to your on-premises environment (which authenticate via basic authentication against on-premises Active Directory), you have two options:

1. You can leverage the built-in Exchange mobile device access rules and block all mobile devices from connecting by setting the following in the Exchange Management Shell:

   ```
   Set-ActiveSyncOrganizationSettings -DefaultAccessLevel Block
   ```

2. You can leverage an on-premises conditional access policy within Intune after installing the on-premises Exchange connector. For more information, see Create a conditional access policy for Exchange on-premises and legacy Exchange Online Dedicated.

   NOTE

   When implementing either of the above on-premises options, be aware that it may impact users connecting to Exchange on their mobile devices.

Create an Intune app protection policy

After hybrid Modern Authentication is enabled, all on-premises mobile users are able to leverage Outlook for iOS and Android using the Microsoft 365 or Office 365-based architecture. Therefore, it's important to protect corporate data with an Intune app protection policy.

Create Intune app protection policies for both iOS and Android using the steps documented in How to create and assign app protection policies. At a minimum, each policy must include the following:

1. They include all Microsoft mobile applications, such as Word, Excel, or PowerPoint, as this will ensure that users can access and manipulate corporate data within any Microsoft app in a secure fashion.

2. They mimic the security features that Exchange provides for mobile devices, including:

   - Requiring a PIN for access (which includes Select Type, PIN length, Allow Simple PIN, Allow fingerprint)

   - Encrypting app data

   - Blocking managed apps from running on "jailbroken" and rooted devices

3. They are assigned to all users. This ensures that all users are protected, regardless of whether they use Outlook for iOS and Android.

In addition to the above minimum policy requirements, you should consider deploying advanced protection policy settings like **Restrict cut, copy and paste with other apps** to further prevent corporate data leakage. For more information on the available settings, see Android app protection policy settings in Microsoft Intune and iOS app protection policy settings.

> **IMPORTANT**
>
> To apply Intune app protection policies against apps on Android devices that are not enrolled in Intune, the user must also install the Intune Company Portal. For more information, see What to expect when your Android app is managed by app protection policies.

Enable hybrid Modern Authentication

1. If you haven't enabled hybrid Modern Authentication, review the prerequisites as outlined in Hybrid Modern Authentication overview and prerequisites for using it with on-premises Skype for Business and Exchange servers. After you've completed the prerequisites, do the steps in How to configure Exchange Server on-premises to use hybrid Modern Authentication.

2. Create an Exchange on-premises device access allow rule to allow Exchange Online to connect to your on-premises environment using the ActiveSync protocol:

   ```
   If ((Get-ActiveSyncOrganizationSettings).DefaultAccessLevel -ne "Allow") {New-
   ActiveSyncDeviceAccessRule -Characteristic DeviceType -QueryString "OutlookService" -AccessLevel Allow}
   ```

   > **NOTE**
   >
   > Device management through the on-premises Exchange admin center is not possible. Intune is required to manage mobile devices.

3. Create an Exchange on-premises device access rule that prevents users from connecting to the on-premises environment with Outlook for iOS and Android with basic authentication over the Exchange ActiveSync protocol:

   ```
   New-ActiveSyncDeviceAccessRule -Characteristic DeviceModel -QueryString "Outlook for iOS and Android" -
   AccessLevel Block
   ```

   > **NOTE**
   >
   > Once this rule is created, Outlook for iOS and Android with Basic authentication users will be blocked.

4. Ensure your on-premises Exchange ActiveSync maxRequestLength is configured to match your transport configuration's MaxSendSize/MaxReceiveSize:

   - Path: `%ExchangeInstallPath%\FrontEnd\HttpProxy\Sync\web.config`
   - Property: `maxRequestLength`
   - Value: set in KB size (10MB is 10240, for example)

Client features that aren't supported

The following features are not supported for on-premises mailboxes using hybrid Modern Authentication with Outlook for iOS and Android.

- Draft folder and Draft messages synchronization
- Shared calendar access and delegate calendar access
- Shared and delegate mailbox data access

- Cortana Time to Leave / Travel Time
- Calendar attachments
- Rich meeting locations
- Task management with Microsoft To-Do
- Add-ins
- Interesting Calendars
- Play My Emails
- Sensitivity labeling
- S/MIME

Connection Flow FAQ

Q: My organization has a security policy that requires Internet inbound connections to be restricted to approved IP addresses or FQDNs. Is that possible with this architecture?

A: Microsoft recommends that the on-premises endpoints for AutoDiscover and ActiveSync protocols be opened and accessible from the Internet without any restrictions. In certain situations that may not be possible. For example, if you're in a co-existence period with another MDM solution, you may want to place restrictions on the ActiveSync protocol to prevent users from bypassing the third-party MDM solution while you migrate to Intune and Outlook for iOS and Android. If you must place restrictions on your on-premises firewall or gateway edge devices, Microsoft recommends filtering based on FQDN endpoints. If FQDN endpoints cannot be used, then filter on IP addresses. Make sure the following IP subnets and FQDNs are whitelisted:

- All Exchange Online FQDNs and IP subnet ranges as defined in Additional endpoints not included in the Microsoft 365 or Office 365 IP Address and URL Web service.
- The AutoDetect FQDNs and IP subnet ranges defined in Additional endpoints not included in the Microsoft 365 or Office 365 IP Address and URL Web service. This is required because the AutoDetect service establishes connections to the on-premises infrastructure.
- All Outlook iOS and Android and Office mobile app FQDNs as defined in Microsoft 365 and Office 365 URLs and IP address ranges.

Q: My organization currently uses a third-party MDM solution to control mobile device connectivity. If I expose the Exchange ActiveSync namespace on the Internet, that introduces a way for users to bypass the third-party MDM solution during the co-existence period. How can I prevent this?

A: There are three potential solutions to resolving this issue:

1. Implement Exchange mobile device access rules to control which devices are approved to connect.
2. Some third-party MDM solutions integrate with Exchange mobile device access rules, blocking unapproved access, while adding approved devices in the user's ActiveSyncAllowedDeviceIDs property.
3. Implement IP restrictions on the Exchange ActiveSync namespace.

Q: Can I leverage Azure ExpressRoute for managing traffic between the Microsoft Cloud and my on-premises environment?

A: Connectivity to the Microsoft Cloud requires Internet connectivity. Microsoft recommends exposing AutoDiscover and Exchange ActiveSync directly to the Internet; for more information, see Microsoft 365 and Office 365 Network Connectivity Principles. However, Azure ExpressRoute is supported for Exchange hybrid scenarios.

For more information, see Azure ExpressRoute for Microsoft 365 and Office 365.

With ExpressRoute, there is no private IP space for ExpressRoute connections, nor can there be "private" DNS resolution. That means that any endpoint your company wants to use over ExpressRoute must resolve in public DNS. If that endpoint resolves to an IP that is contained in the advertised prefixes associated with the ExpressRoute circuit (your company must configure those prefixes in the Azure portal when you enable Microsoft peering on the ExpressRoute connection), then the outbound connection from Exchange Online to your on-premises environment will route through the ExpressRoute circuit. Your company will have to ensure that the return traffic associated with these connections goes through the ExpressRoute circuit (avoiding asymmetric routing).

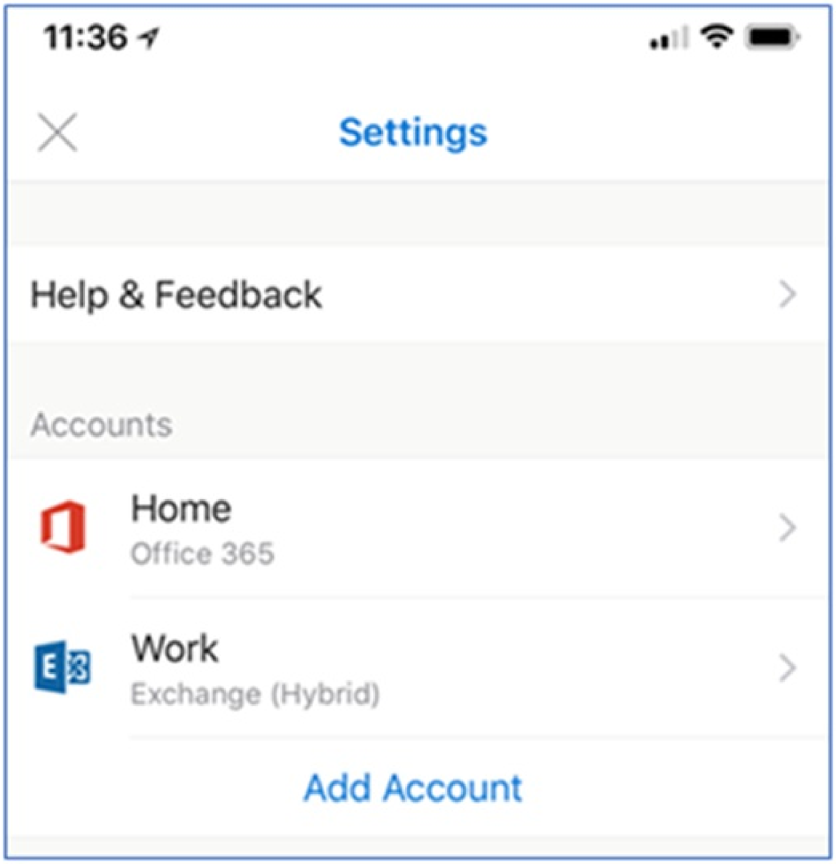
> **IMPORTANT**
>
> Because your company will be adding the Exchange AutoDiscover and ActiveSync namespaces to the advertised prefixes in the ExpressRoute circuit, the only way to reach the Exchange AutoDiscover and ActiveSync endpoints will be via the ExpressRoute. In other words, the only mobile device that will be able to connect to on-premises via the AutoDiscover and ActiveSync namespaces will be Outlook for iOS and Android. All other clients (such as mobile devices' native mail clients) will be unable to connect to the on-premises environment as the connection will not be established from the Microsoft Cloud. This is because there cannot be any overlaps of the public IP space advertised to Microsoft on the ExpressRoute circuit and the public IP space advertised on your Internet circuit(s).

Q: Given only four weeks of message data is synchronized to Exchange Online, does this mean that search queries executed in Outlook for iOS and Android cannot return information beyond the data available on the local device?

A: When a search query is performed in Outlook for iOS and Android, items that match the search query are returned if they are located on the device. In addition, the search query is passed to Exchange on-premises via Exchange Online. Exchange on-premises executes the search query against the on-premises mailbox and returns the results to Exchange Online, which relays the results to the client. The on-premises query results are stored in Exchange Online for one day before being deleted.

Q: How do I know that the email account is added correctly in Outlook for iOS and Android?

A: On-premises mailboxes that are added via hybrid Modern Authentication are labelled as **Exchange (Hybrid)** in the account settings in Outlook for iOS and Android, similar to the following example:



Authentication FAQ

Q: What identity configurations are supported with hybrid Modern Authentication and Outlook for iOS and Android?

A: The following identity configurations with Azure Active Directory are supported with hybrid Modern Authentication:

- Federated Identity with any on-premises identity provider that is supported by Azure Active Directory
- Password Hash Synchronization via Azure Active Directory Connect
- Pass-through Authentication via Azure Active Directory Connect

Q: What authentication mechanism is used for Outlook for iOS and Android? Are credentials stored in Microsoft 365 or Office 365?

A: See Account setup with modern authentication in Exchange Online.

Q: Do Outlook for iOS and Android and other Microsoft Office mobile apps support single sign-on?

A: See Account setup with modern authentication in Exchange Online.

Q: What is the lifetime of the tokens generated and used by the Active Directory Authentication Library (ADAL) in Outlook for iOS and Android?

A: See Account setup with modern authentication in Exchange Online.

Q: What happens to the access token when a user's password is changed?

A: See Account setup with modern authentication in Exchange Online.

Q: Is there a way for a user to bypass AutoDetect when adding their account to Outlook for iOS and Android?

A: Yes, a user can bypass AutoDetect at any time and manually configure the connection using Basic authentication over the Exchange ActiveSync protocol. To ensure that the user does not establish a connection to your on-premises environment via a mechanism that does not support Azure Active Directory Conditional Access or Intune app protection policies, the on-premises Exchange Administrator needs to configure an Exchange device access rule that blocks the ActiveSync connection. To do this, type the following command in the Exchange Management Shell:

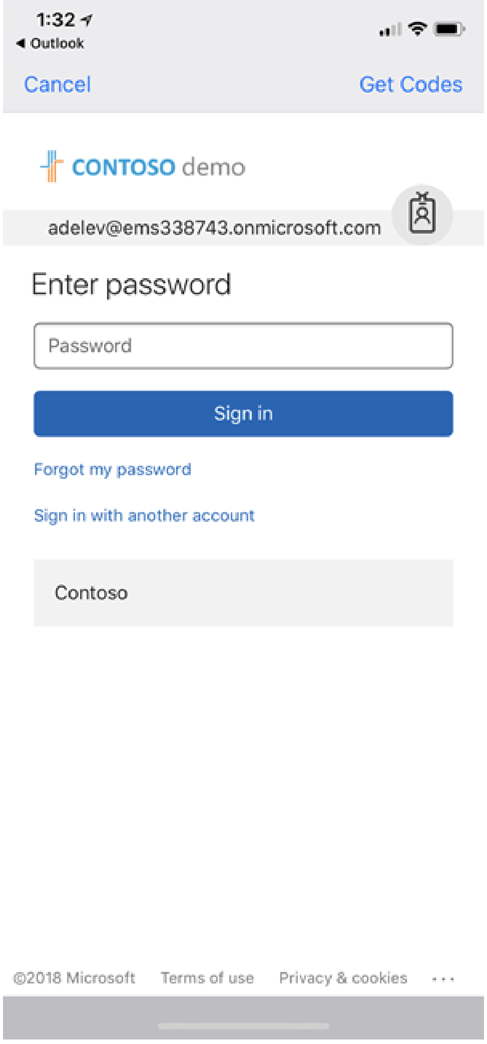
```
New-ActiveSyncDeviceAccessRule -Characteristic DeviceModel -QueryString "Outlook for iOS and Android" -
AccessLevel Block
```

Troubleshooting

Below are the most common issues or errors with on-premises mailboxes using hybrid Modern Authentication with Outlook for iOS and Android.

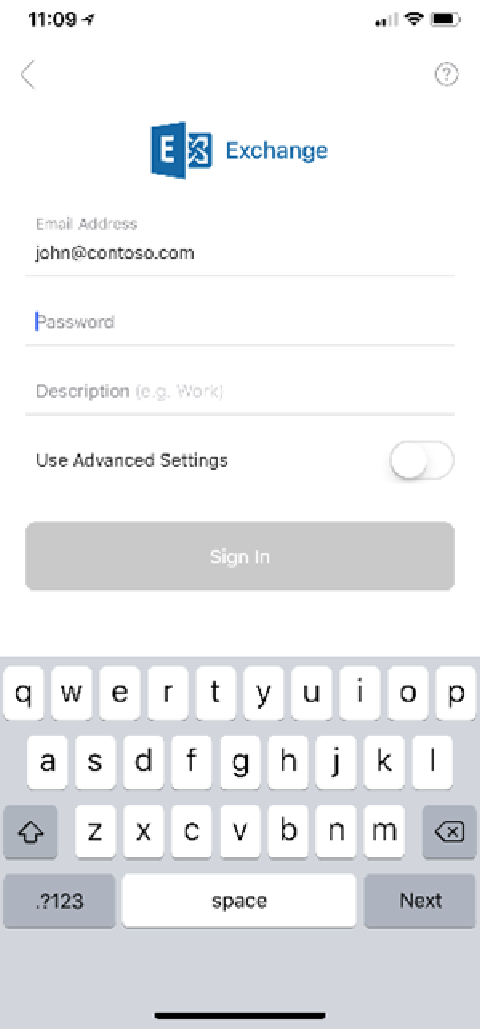
AutoDiscover and ActiveSync

During profile creation, the user should be presented a Modern Authentication dialog similar to this:



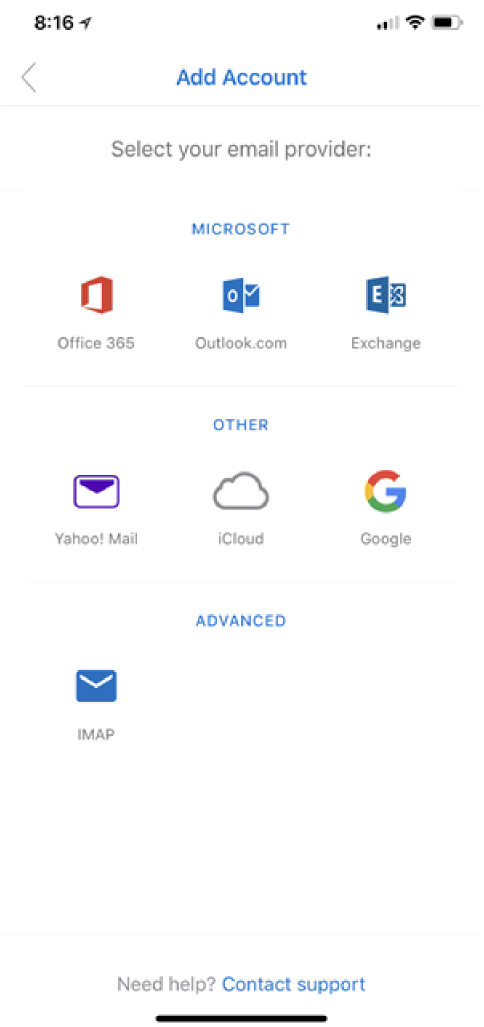
If, instead, the user is presented with one of the following dialogs, then there is an issue with either the Autodiscover or ActiveSync on-premises endpoints.

Here is an example of a user being presented with the legacy Basic authentication Exchange ActiveSync experience:



Email Address
john@contoso.com

And here's an example of what users see when AutoDetect isn't able to discover the configuration for users' on-premises mailboxes.



In either scenario, verify that your on-premises environment is correctly configured. To do this: from the TechNet Gallery, download and execute the script for Validating Hybrid Modern Authentication setup for Outlook for iOS and Android.

When you review the output from the script, you should be seeing the following from AutoDiscover:

```
{
    "Protocol": "activesync",
    "Url": "https://mail.contoso.com/Microsoft-Server-ActiveSync"
}
```

The on-premises ActiveSync endpoint should return the following response, where the WWW-Authenticate header includes an authorization_uri:

```
Content-Length →0
Date →Mon, 29 Jan 2018 19:51:46 GMT
Server →Microsoft-IIS/10.0 Microsoft-HTTPAPI/2.0
WWW-Authenticate →Bearer client_id="00000002-0000-0ff1-ce00-000000000000", trusted_issuers="00000001-0000-0000-c000-000000000000@5de110f8-2e0f-4d45-891d-bcf2218e253d,00000004-0000-0ff1-ce00-000000000000@contoso.com", token_types="app_asserted_user_v1 service_asserted_app_v1", authorization_uri="https://login.windows.net/common/oauth2/authorize"
Www-Authenticate →Basic realm="mail.contoso.com"
X-Powered-By →ASP.NET
request-id →5ca2c827-5147-474c-8457-63c4e5099c6e
```

If the AutoDiscover or ActiveSync responses are not similar to the above examples, you can investigate the following as possible causes:

1. If the AutoDiscover endpoint cannot be reached, then it's likely there's a firewall or load balancer configuration issue (for example, IP restrictions are configured and the required IP ranges are not present). Also, there may be a device in front of Exchange requiring pre-authentication to access the AutoDiscover endpoint.

2. If the AutoDiscover endpoint does not return the correct URL, then there is a configuration issue with the ActiveSync virtual directory's ExternalURL value.

3. If the ActiveSync endpoint cannot be reached, then there is a firewall or load balancer configuration issue. Again, one example is IP restrictions are configured and the required IP ranges are not present. Also, there may be a device in front of Exchange requiring pre-authentication to access the ActiveSync endpoint.

4. If the ActiveSync endpoint does not contain an authorization_uri value, verify that the EvoSTS authentication server is configured as the default endpoint using Exchange Management Shell:

   ```
   Get-AuthServer EvoSts | Format-List IsDefaultAuthorizationEndpoint
   ```

5. If the ActiveSync endpoint does not contain a WWW-Authenticate header, then a device in front of Exchange may be responding to the query.

Client synchronization issues

There are a few scenarios that can result in data being stale in Outlook for iOS and Android. Typically, this is due to an issue with the second access token (the token used by MRS in Exchange Online to synchronize the data with the on-premises environment). The two most common reasons for this issue are:

- SSL/TLS offloading on-premises.
- EvoSTS certificate metadata issues.

With SSL/TLS offloading, tokens are issued for a specific uri and that value includes the protocol value ("https://"). When the load balancer offloads SSL/TLS, the request Exchange receives comes in via HTTP, resulting in a claim mismatch due to the protocol value being http://. The following is an example of a response header from a Fiddler trace:

```
Content-Length →0
Date →Mon, 29 Jan 2018 19:51:46 GMT
Server →Microsoft-IIS/10.0 Microsoft-HTTPAPI/2.0
WWW-Authenticate →Bearer client_id="00000002-0000-0ff1-ce00-000000000000", trusted_issuers="00000001-0000-
0000-c000-000000000000@00c118a9-2de9-41d3-b39a-81648a7a5e4d",
authorization_uri="https://login.windows.net/common/oauth2/authorize", error="invalid_token"
WWW-Authenticate →Basic realm="mail.contoso.com"
X-Powered-By →ASP.NET
request-id →2323088f-8838-4f97-a88d-559bfcf92866
x-ms-diagnostics →2000003;reason="The hostname component of the audience claim value is invalid. Expected
'https://mail.contoso.com'. Actual 'http://mail.contoso.com'.";error_category="invalid_resource"
```

As specified above in the section *Technical and licensing requirements*, SSL/TLS offloading is not supported for OAuth flows.

For EvoSTS Certificate Metadata, the certificate metadata leveraged by EvoSTS is occasionally updated in Microsoft 365 or Office 365. The Exchange on-premises arbitration mailbox that has the organization capability of "OrganizationCapabilityManagement" is responsible for detecting the changes and for updating the corresponding metadata on-premises; this process executes every eight hours.

Exchange Administrators can find this mailbox by executing the following cmdlet using Exchange Management Shell:

```
$x=Get-mailbox -arbitration | ? {$_.PersistedCapabilities -like "OrganizationCapabilityManagement"};Get-
MailboxDatabaseCopyStatus $x.database.name
```

On the server hosting the database for the OrganizationCapabilityManagement arbitration mailbox, review the application event logs for events with a source of **MSExchange AuthAdmin**. The events should tell you if Exchange was able to refresh the metadata. If the metadata is out of date, you can manually refresh it with this ccmdlet:

```
Set-AuthServer EvoSts -RefreshAuthMetadata
```

You can also create a scheduled task that executes the above command every 24 hours.

Exchange Online statistics

You can use the following Exchange Online cmdlets to see statistical information for each synchronized on-premises mailbox.

1. First, obtain the location of the synchronized on-premises mailbox in the tenant, specifying the on-premises mailbox's identity (for example, jane@contoso.com).

   ```
   $m = Get-MailboxLocation <identity>
   ```

2. To see mailbox-related statistics, use

   ```
   Get-MailboxStatistics $m.id
   ```

3. To see mobile device statistics (like seeing when Outlook for iOS and Android last synchronized to Exchange Online), use

   ```
   Get-MobileDeviceStatistics -Mailbox $m.id
   ```

For more information, see Get-MailboxStatistics and Get-MobileDeviceStatistics.

Other issues

There are other issues that may prevent hybrid Modern Authentication from functioning correctly. For more information, see the troubleshooting section in Announcing Hybrid Modern Authentication for Exchange On-Premises.

Using Basic authentication with Outlook for iOS and Android

8/3/2020 • 4 minutes to read • Edit Online

The Outlook app for iOS and Android is designed to bring together email, calendar, contacts, and other files, enabling users in your organization to do more from their mobile devices. This article provides an overview of the architecture and the storage design of the app, so that Exchange administrators can deploy and maintain Outlook for iOS and Android in their Exchange organizations.

NOTE

This article is about using the app in an Exchange 2010, Exchange 2013, Exchange 2016 or Exchange 2019 environment where hybrid modern authentication is **not** enabled. For more information about using hybrid Modern Authentication for on-premises mailboxes with the app, see Using hybrid Modern Authentication with Outlook for iOS and Android. For information about using the app with Exchange Online, see Outlook for iOS and Android in Exchange Online.

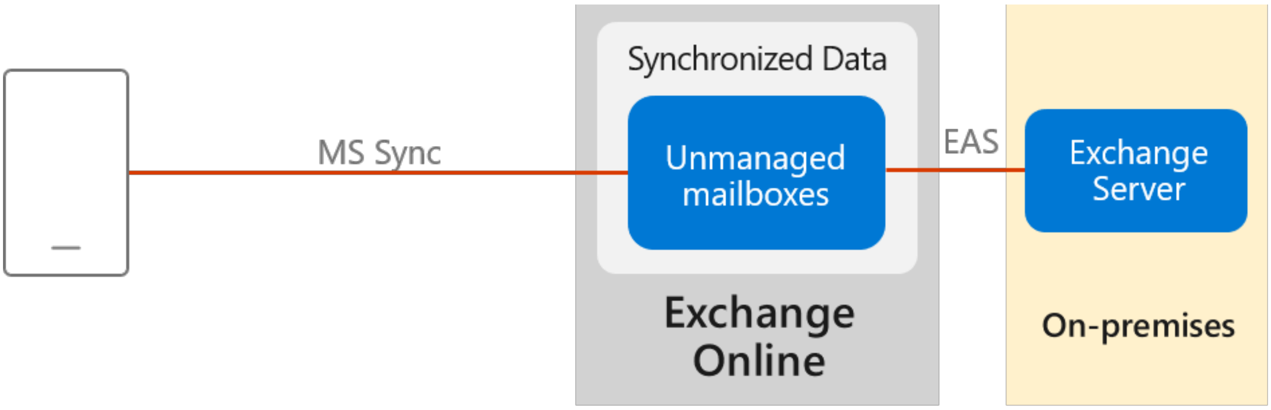
Outlook for iOS and Android architecture

Outlook for iOS and Android is a cloud-backed application. This means your experience consists of a locally installed app powered by a secure and scalable service running in the Microsoft Cloud.

For Exchange Server mailboxes, Outlook for iOS and Android's architecture is built directly into the Microsoft Cloud, providing customers the additional benefits of security, privacy, built-in compliance, and transparent operations that Microsoft commits to in the Microsoft Trust Center.

The following environments will take advantage of this Microsoft 365 or Office 365-based architecture:

- In Exchange Server 2010 environments
- When a hybrid relationship between Exchange 2013, 2016, or 2019 on-premises and Microsoft 365 or Office 365 has not been configured
- When hybrid Modern Authentication has not been enabled between Exchange 2013, 2016, or 2019 on-premises and Microsoft 365 or Office 365



Within the Microsoft 365 or Office 365-based architecture, Outlook for iOS and Android utlilizes the native Microsoft sync technology for data synchronization which is protected by TLS-secured connections end-to-end, between Microsoft 365 or Office 365 and the app.

The Exchange ActiveSync (EAS) connection between Exchange Online and the on-premises environment enables synchronization of the users' on-premises data and includes four weeks of email, all calendar data, all contact data, and out-of-office status. The region in which this data is synchronized into depends on the IP address in use by the mobile device at the time synchronization is setup. If you have a hybrid setup with an Exchange Online tenant, the on-premises data is not synchronized into your tenant; instead, the data is synchronized into Outlook.com. If you want to control and manage your on-premises data from within your tenant, you need to enable hybrid Modern Authentication with Outlook for iOS and Android.

Data synchronization between the Exchange on-premises environment and Exchange Online happens independent of user behavior. This ensures that new messages are delivered to the devices very quickly. For more information on how the user authentication model enables data synchronization independently of user behavior, see Passwords and security in Outlook for iOS and Android for Exchange Server.

Processing information in the Microsoft Cloud enables advanced features and capabilities, such as the categorization of email for the Focused Inbox, customized experience for travel and calendar, and improved search speed. Relying on the cloud for intensive processing and minimizing the resources required from users' devices enhances the app's performance and stability. Lastly, it allows Outlook to build features that work across all email accounts, regardless of the technological capabilities of the underlying servers (such as different versions of Exchange Server, Microsoft 365, or Office 365).

IMPORTANT

On-premises mailboxes using basic authentication with Outlook for iOS and Android do not support Enterprise Mobility + Security features such as Azure Active Directory conditional access and Intune app protection policies. For support with these technologies, see Using hybrid Modern Authentication with Outlook for iOS and Android.

Data security, access, and auditing controls

With on-premises data being synchronized with Exchange Online, customers have questions about how the data is protected in Exchange Online. The white paper Encryption in the Microsoft Cloud discusses how BitLocker is used for volume-level encryption.

By default, Microsoft engineers have zero standing administrative privileges and zero standing access to customer content in Microsoft 365 and Office 365. The white paper Administrative Access Controls in Microsoft 365 discusses personnel screening, background checks, Lockbox and Customer Lockbox, and more.

ISO Audited Controls on Service Assurance documentation provides the status of audited controls from global information security standards and regulations that Microsoft 365 and Office 365 have implemented.

Connectivity Requirements

Microsoft recommends that the on-premises endpoints for AutoDiscover and ActiveSync protocols be opened and accessible from the Internet without any restrictions. In certain situations that may not be possible. If you must place restrictions on your on-premises firewall or gateway edge devices, Microsoft recommends filtering based on FQDN endpoints. If FQDN endpoints cannot be used, then filter on IP addresses. Make sure the following IP subnets and FQDNs are whitelisted:

- All Exchange Online FQDNs and IP subnet ranges as defined in Microsoft 365 and Office 365 URLs and IP address ranges.
- The AutoDetect FQDNs and IP subnet ranges defined in Additional Microsoft 365 or Office 365 IP Addresses and URLs not included in the web services. This is required because the AutoDetect service establishes connections to the on-premises infrastructure.
- All Outlook iOS and Android and Office mobile app FQDNs as defined in Microsoft 365 or Office 365 URLs

and IP address ranges.

Client features that aren't supported

The following features are not support for on-premises mailboxes using basic authentication with Outlook for iOS and Android:

- Draft folder and Draft messages synchronization
- Shared calendar access and Delegate calendar access
- Shared and delegate mailbox data access
- Cortana Time to Leave / Travel Time
- Calendar attachments
- Rich meeting locations
- Task management with Microsoft To-Do
- Favorite People with Notifications
- Add-ins
- Interesting Calendars
- Avatar support
- Play My Emails
- S/MIME
- Sensitivity labeling
- Discover Feed
- Privacy settings

Account setup in Outlook for iOS and Android using Basic authentication

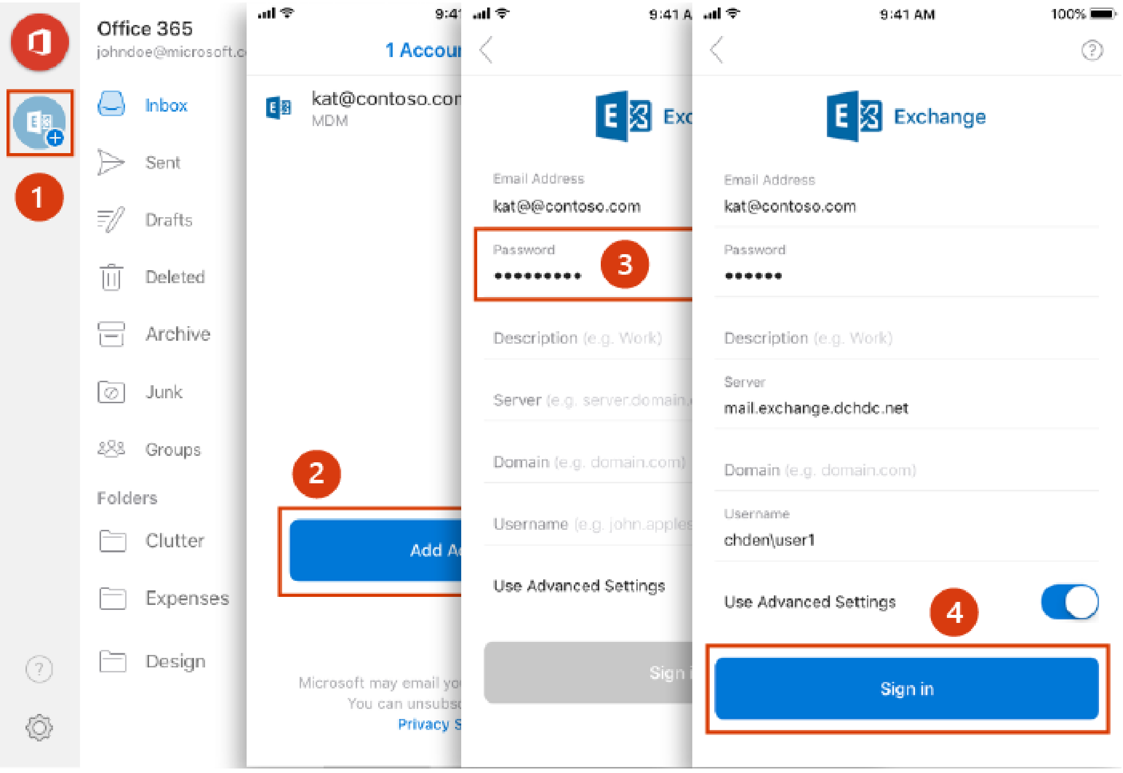
8/3/2020 • 5 minutes to read • Edit Online

Outlook for iOS and Android offers Exchange administrators the ability to "push" account configurations to their on-premises users who use Basic authentication with the ActiveSync protocol. This capability works with any Mobile Device Management (MDM) provider who uses the Managed App Configuration channel for iOS or the Android in the Enterprise channel for Android.

For on-premises users enrolled in Microsoft Intune, you can deploy the account configuration settings using Intune in the Azure Portal.

Once an account configuration has been created and the user enrolls their device, Outlook for iOS and Android will detect that an account is "Found" and will then prompt the user to add the account. The only information the user needs to enter to complete the setup process is their password. Then, the user's mailbox content will load and the user can begin using the app.

The following images show an example of the end-user setup process after Outlook for iOS and Android has been configured in Intune in the Azure Portal.



Create an app configuration policy for Outlook for iOS and Android using Microsoft Intune

If you're using Microsoft Intune as your mobile device management provider, the following steps will allow you to deploy account configuration settings for your on-premises mailboxes that leverage basic authentication with the ActiveSync protocol. Once the configuration is created, you can assign the settings to groups of users, as detailed in the next section, Assign configuration settings.

> **NOTE**
>
> If users in your organization use both iOS and Android for Work devices, you'll need to create a separate app configuration policy for each platform.

1. Sign into Microsoft Endpoint Manager.
2. Select **Apps** and then select **App configuration policies**.
3. On the **App Configuration policies** blade, choose **Add** and select **Managed devices**.
4. On the **Add app configuration** blade, enter a **Name**, and optional **Description** for the app configuration settings.
5. For **Platform**, choose either **iOS/iPadOS** or **Android**.
6. For **Associated app**, choose **Select the required app**, and then, on the **Targeted apps** blade, choose **Microsoft Outlook**.

   > **NOTE**
   >
   > If Outlook is not listed as an available app, then you must add it by following the instructions in Add Android store apps to Microsoft Intune and How to add iOS store apps to Microsoft Intune.

7. Click **OK** to return to the **Add app configuration** blade.
8. Choose **Configuration Settings**. On the **Configuration** blade, select **Use configuration designer** for the **Configuration settings format**. The key value pairs used in this section are defined in the section Key value pairs.
9. If you want to deploy account setup configuration, select **Yes** for **Configure email account settings** and configure appropriately:

   - For **Authentication type**, select **Basic authentication**. This is required for on-premises accounts that do not leverage hybrid modern authentication.
   - For **Username attribute from AAD**, select **User Principal Name** or **sAMAccountName**. If **sAMAccountName** is selected, enter the NetBIOS domain name in the **Account domain** field.
   - For **Email address attribute from AAD**, select **Primary SMTP Address**.
   - For **Email server**, enter the Exchange ActiveSync externally accessible domain name.
   - For **Email account name**, enter a descriptive value for the account.

10. If you want to deploy general app configuration settings, configure the desired settings accordingly:

    - For **Focused Inbox**, choose from the available options: **Not configured** (default), **On** (app default), **Off**.
    - For **Require Biometrics to access the app**, choose from the available options: **Not configured** (default), **On**, **Off** (app default). When selecting **On** or **Off**, administrators can choose to allow the user to change the app setting's value. Select **Yes** (app default) to allow the user to change the setting or choose **No** if you want to prevent the user from changing the setting's value. This setting is only available in Outlook for iOS.
    - For **Save Contacts**, choose from the available options: **Not configured** (default), **On**, **Off** (app default). When selecting **On** or **Off**, administrators can choose to allow the user to change the app

setting's value. Select **Yes** (app default) to allow the user to change the setting or choose **No** if you want to prevent the user from changing the setting's value.

- For **Default app signature**, choose from the available options: **Not configured** (default), **On** (app default), **Off**.
- For **Block external images**, choose from the available options: **Not configured** (default), **On**, **Off** (app default). When selecting **On** or **Off**, administrators can choose to allow the user to change the app setting's value. Select **Yes** (app default) to allow the user to change the setting or choose **No** if you want to prevent the user from changing the setting's value.
- For **Organize mail by thread**, choose from the available options: **Not configured** (default), **On** (app default), **Off**.

11. When you are done, choose **OK**.
12. On the **Add app configuration** blade, choose **Add**.

The newly created configuration policy is displayed on the **App configuration** blade.

Assign configuration settings

You assign the settings to groups of users in Azure Active Directory. When a user has the Microsoft Outlook app installed, the app is managed by the settings you have specified. To do this:

1. From the **Apps - App configuration policies** blade, select the app configuration policy you want to assign.
2. On the next blade, choose **Assignments**.
3. On the **Assignments** blade, select **Select groups to include** and choose the Azure AD group to which you want to assign the app configuration, and then choose **Select**.
4. Select **Save** to save and assign the app configuration policy.

Key value pairs

When you create an app configuration policy in the Azure Portal or through your MDM provider, you will need the following key value pairs:

KEY	VALUES
com.microsoft.outlook.EmailProfile.EmailAccountName	This value specifies the display name email account as it will appear to users on their devices. **Value type**: String **Accepted values**: Display Name **Default if not specified**: <blank> **Required**: Yes **Example**: user **Intune Token***: {{username}}
com.microsoft.outlook.EmailProfile.EmailAddress	This value specifies the email address to be used for sending and receiving mail. **Value type**: String **Accepted values**: Email address **Default if not specified**: <blank> **Required**: Yes **Example**: user@companyname.com **Intune Token***: {{mail}}

KEY	VALUES
com.microsoft.outlook.EmailProfile.EmailUPN	This value specifies the User Principal Name or username for the email profile that will be used to authenticate the account. **Value type**: String **Accepted values**: UPN Address or username **Default if not specified**: <blank> **Required**: Yes **Example**: userupn@companyname.com **Intune Token**[*]: {{userprincipalname}}
com.microsoft.outlook.EmailProfile.ServerAuthentication	This value specifies the authentication method for the user. **Value type**: String **Accepted values**: 'Username and Password' **Default if not specified**: 'Username and Password' **Required**: No **Example**: 'Username and Password'
com.microsoft.outlook.EmailProfile.ServerHostName	This value specifies the host name of your Exchange server. **Value type**: String **Accepted values**: ActiveSync FQDN **Default if not specified**: <blank> **Required**: Yes **Example**: mail.companyname.com
com.microsoft.outlook.EmailProfile.AccountDomain	This value specifies the user's account domain. **Value type**: String **Accepted values**: Domain **Default if not specified**: <blank> **Required**: No **Example**: companyname
com.microsoft.outlook.EmailProfile.AccountType	This value specifies the account type being configured based on the authentication model. **Value type**: String **Accepted values**: BasicAuth **Default if not specified**: BasicAuth **Required**: No **Example**: BasicAuth

[*] Microsoft Intune users can use tokens that will expand to the correct value according to the MDM enrolled user. See Add app configuration policies for managed iOS devices for more information.

Passwords and security in Outlook for iOS and Android for Exchange Server

8/3/2020 • 6 minutes to read • Edit Online

This article describes how passwords and security work in Outlook for iOS and Android with Exchange Server when using Basic authentication with the Exchange ActiveSync protocol.

> **IMPORTANT**
> Outlook for iOS and Android supports hybrid Modern Authentication for on-premises mailboxes which eliminates the need to leverage basic authentication. The information contained in this article only pertains to basic authentication. For more information, please see Using hybrid Modern Authentication with Outlook for iOS and Android.

Creating an account and protecting passwords

The first time the Outlook app for iOS and Android is run in an Exchange on-premises environment, Outlook generates a random AES-128 key. This key is known as the *device key* and is stored only on the user's device.

When a user logs onto Exchange with Basic authentication, the username, password, and a unique AES-128 device key are sent from the user's device to the Outlook cloud service over a TLS connection, where the device key is held in runtime compute memory. After verifying the password with the Exchange server, the Microsoft 365 or Office 365-based architecture uses the device key to encrypt the password, and the encrypted password is then stored in the service. The device key, meanwhile, is wiped from memory and never stored in the Microsoft 365 or Office 365-based architecture (the key is only stored on the user's device).

Next, when a user attempts to connect to Exchange to retrieve mailbox data, the device key is again passed from the device to the Microsoft 365 or Office 365-based architecture over a TLS-secured connection, where it is used to decrypt the password in runtime compute memory. Once decrypted, the password is never stored in the service or written to a local storage disk, and the device key is once again wiped from memory.

After the Microsoft 365 or Office 365-based architecture has decrypted the password at runtime, the service can then connect to the Exchange server to synchronize mail, calendar, and other mailbox data. As long as the user continues to open and use Outlook periodically, the Microsoft 365 or Office 365-based architecture will keep a copy of the user's decrypted password in memory to keep the connection to the Exchange server active.

Compliance considerations when sending passwords

Before you enable anything that allows for the transmission of passwords from your on-premises Exchange environment, be sure to consider the possible ramifications. For example, transmitting passwords to Microsoft 365 or Office 365-based architecture might result in your inability to meet the requirements of PCI-DSS or ISO/IEC 27001.

Furthermore, if you connect and synchronize email, calendars, and other email-related data, you might run into issues of compliance with GDPR, which restricts the private information that you can transmit without owner consent. This information might be contained in and found within emails, calendar items, and so on.

Account inactivity and flushing passwords from memory

After three days of inactivity, the Microsoft 365 or Office 365-based architecture will flush a decrypted password from memory. With the decrypted password flushed, the architecture is unable to access a user's mailbox on-premises. The encrypted password remains stored in the Microsoft 365 or Office 365-based architecture, but decrypting it again isn't possible without the device key, which is only available from the user's device.

There are three ways a user account can become inactive:

- Outlook for iOS and Android is uninstalled by the user.
- Background app refresh is disabled in the Settings options, and then a force-quit is applied to Outlook.
- No internet connection is available on the device, preventing Outlook from synchronizing with Exchange.

> **NOTE**
>
> Outlook will not become inactive simply because the user does not open the app for some time, such as over a weekend or while on vacation. As long as background app refresh is enabled (which is the default setting for Outlook for iOS and Android), functions like push notifications and background synchronization of email will count as activity.

Flushing encrypted password and synchronized mailbox data from Microsoft 365 or Office 365

The Microsoft 365 or Office 365-based architecture flushes, or deletes, inactive accounts on a weekly schedule. After a user account becomes inactive, the architecture will flush both the encrypted password and all of the user's synchronized mailbox content out of the service.

Device and service security combination

Each user's unique device key is never stored in the Microsoft 365 or Office 365-based architecture, and a user's Exchange password is never stored on the device. This architecture means that for a malicious party to gain access to a user's password, they would need both unauthorized access to the Microsoft 365 or Office 365-based architecture and physical access to that user's device.

By enforcing PIN policies and encryption on devices in your organization, the malicious party would also have to defeat a device's encryption to get access to the device key. This would all have to take place before the user noticed that the device was compromised and could request a remote wipe for the device.

Password security FAQ

The following are frequently asked questions regarding security design and settings for Outlook for iOS and Android when used with Basic authentication.

Are user credentials stored in the Microsoft 365 or Office 365-based architecture if I block Outlook from accessing my Exchange Server?

If you have chosen to block Outlook for iOS and Android from accessing your on-premises Exchange servers, the initial connection will be rejected by Exchange. User credentials will not be stored by the Outlook cloud service and the credentials presented in the failed connection attempt are immediately flushed from memory.

How is the unique device key and user password encrypted in transit to the Microsoft 365 or Office 365-based architecture?

All communication between the Outlook app and the Microsoft 365 or Office 365-based architecture is through an encrypted TLS connection. The Outlook app is capable of connecting with the Microsoft 365 or Office 365-based architecture and nothing else.

How do I remove a user's credentials and mailbox information from the Microsoft 365 or Office 365-based architecture?

Have the user uninstall Outlook for iOS and Android on all devices. All data will be removed from the Microsoft 365 or Office 365-based architecture in approximately 3-7 days.

The app is closed or uninstalled, but I still see it connecting to my Exchange server. How is this happening?

The Microsoft 365 or Office 365-based architecture decrypts user passwords in runtime compute memory and then uses the decrypted passwords to connect to Exchange. Since the architecture is connecting to Exchange on behalf of the device to fetch and cache mailbox data, it can continue for a short period until the service detects that Outlook is no longer requesting data.

If a user uninstalls the app from their device without first using the **Delete Account** option, the Microsoft 365 or Office 365-based architecture will stay connected to your Exchange server until the account becomes inactive, as described above in "Account inactivity and flushing passwords from memory." To stop this activity, follow Option 1 or Option 3 from the above FAQ, or block the app, as described in Blocking Outlook for iOS and Android.

Is a user password less secure in Outlook for iOS and Android than when using other Exchange ActiveSync clients?

No. EAS clients generally save user credentials locally on the user's device. This means a stolen or compromised device could result in a malicious party gaining access to the user's password. With the security design of Outlook for iOS and Android, a malicious party would need unauthorized access to the Microsoft 365 or Office 365-based architecture **and** have physical access to a user's device.

What happens if a user attempts to use Outlook for iOS and Android after their data has been deleted from the Outlook cloud service?

If a user account becomes inactive (such as by disabling background app refresh on the device or having their device disconnected from the Internet for some time), the Outlook app will reconnect to the Microsoft 365 or Office 365-based architecture the next time the app is launched, and the password encryption and email caching process will restart. This is all transparent to the user.

Is there a way to prevent the use of Basic authentication for on-premises mailboxes with Outlook for iOS and Android?

Yes, you can deploy hybrid Modern Authentication. For more information, see Using hybrid Modern Authentication with Outlook for iOS and Android.

Managing devices for Outlook for iOS and Android for Exchange Server

8/3/2020 • 8 minutes to read • Edit Online

IMPORTANT

Outlook for iOS and Android supports hybrid Modern Authentication for on-premises mailboxes which eliminates the need to leverage basic authentication. The information contained in this article only pertains to basic authentication. For more information, please see Using hybrid Modern Authentication with Outlook for iOS and Android.

Microsoft recommends Exchange ActiveSync for managing the mobile devices that are used to access Exchange mailboxes in your on-premises environment. Exchange ActiveSync is a Microsoft Exchange synchronization protocol that lets mobile phones access an organization's information on a server that's running Microsoft Exchange.

This article focuses on specific Exchange ActiveSync features and scenarios for mobile devices running Outlook for iOS and Android when authenticating with Basic authentication. Complete information about the Microsoft Exchange synchronization protocol is available in Exchange ActiveSync. In addition, there is information on the Office Blog detailing password enforcement and other benefits of using Exchange ActiveSync with devices running Outlook for iOS and Android.

Mobile device mailbox policy

Outlook for iOS and Android supports the following mobile device mailbox policy settings in Exchange on-premises:

- Device encryption enabled
- Min password length (only on Android)
- Password enabled
- Allow Bluetooth (used to manage the Outlook for Android wearable app)
  - When AllowBluetooth is enabled (default behavior) or configured for HandsfreeOnly, wearable synchronization between Outlook on the Android device and Outlook on the wearable is allowed for the work or school account.
  - When AllowBluetooth is disabled, Outlook for Android will disable synchronization between Outlook on the Android device and Outlook on the wearable for the specified work or school account (and delete any data previously synced for the account). Disabling the synchronization is controlled entirely within Outlook itself; Bluetooth is not disabled on the device or wearable nor is any other wearable app affected.

NOTE

Outlook for Android will roll out support for the AllowBluetooth setting beginning at the end of August.

For information on how to create or modify an existing mobile device mailbox policy, see Mobile device mailbox policies.

PIN lock and device encryption

If your organization's Exchange ActiveSync policy requires a password on mobile devices in order for users to synchronize email, Outlook will enforce this policy at the device level. This works differently between iOS devices and Android devices, based on the available controls provided by Apple and Google.

On iOS devices, Outlook checks to make sure a passcode or PIN is properly set. In the event a passcode is not set, Outlook prompts users to create a passcode in iOS settings. Until the passcode is setup, the user will be unable to access Outlook for iOS.

On Android devices, Outlook will enforce screen lock rules. In addition, Google provides controls that allow Outlook for Android to comply with Exchange policies regarding password length and complexity, and the number of allowable screen-unlock attempts before wiping the phone. Outlook for Android will also encourage storage encryption if it is not enabled, guiding users through this process with a step-by-step walkthrough.

iOS and Android devices that do not support these password security settings will not be able to connect to an Exchange mailbox.

Device encryption

iOS devices are shipped with built-in encryption, which Outlook uses once the passcode is enabled to encrypt all the data Outlook stores locally on the iOS device. Therefore, iOS devices with a PIN are encrypted whether or not this is required by an ActiveSync policy.

Outlook for Android supports device encryption via Exchange mobile device mailbox policies. However, prior to Android 7.0, the availability and implementation of this process varies by Android OS version and device manufacturer, which allow the user to cancel out during the encryption process. With changes that Google introduced to Android 7.0, Outlook for Android is now able to enforce encryption on devices running Android 7.0 or later. Users with devices running those operating systems will not be able to cancel out of the encryption process.

Even if the Android device is unencrypted and an attacker is in possession of the device, as long as a device PIN is enabled, the Outlook database remains inaccessible. This is true even with USB debugging enabled and the Android SDK installed. If an attacker attempts to root the device to bypass the PIN to gain access to this information, the rooting process wipes all device storage and removes all Outlook data. If the device is unencrypted and rooted by the user prior to being stolen, it is possible for an attacker to gain access to the Outlook database by enabling USB debugging on the device and plugging the device into a computer with the Android SDK installed.

Remote wipe with Exchange ActiveSync

Exchange ActiveSync enables administrators to remotely wipe devices, such as if they become compromised or lost/stolen. With Outlook for iOS and Android, a remote wipe only wipes data within the Outlook app itself and does not trigger a full device wipe.

See Perform a remote wipe on a mobile phone for more information.

Device access policy

Outlook for iOS and Android should be enabled by default, but in some existing Exchange on-premises environments the app may be blocked for a variety of reasons. Once an organization decides to standardize how users access Exchange data and use Outlook for iOS and Android as the only email app for end users, you can configure blocks for other email apps running on users' iOS and Android devices. You have two options for instituting these blocks within Exchange on-premises: the first option blocks all devices and only allows usage of Outlook for iOS and Android; the second option allows you to block individual devices from using the native Exchange ActiveSync apps.

NOTE

Because device IDs are not governed by any *physical device* ID, they can change without notice. When this happens, it can cause unintended consequences when device IDs are used for managing user devices, as existing 'allowed' devices may be unexpectedly blocked or quarantined by Exchange. Therefore, Microsoft recommends administrators only set mobile device access policies that allow/block devices based on device type or device model.

Option 1: Block all email apps except Outlook for iOS and Android

You can define a default block rule and then configure an allow rule for Outlook for iOS and Android, and for Windows devices, using the following Exchange on-premises PowerShell commands. This configuration will prevent any Exchange ActiveSync native app from connecting, and will only allow Outlook for iOS and Android.

1. Create the default block rule:

   ```
   Set-ActiveSyncOrganizationSettings -DefaultAccessLevel Block
   ```

2. Create an allow rule for Outlook for iOS and Android

   ```
   New-ActiveSyncDeviceAccessRule -Characteristic DeviceModel -QueryString "Outlook for iOS and Android" -
   AccessLevel Allow
   ```

3. **Optional**: Create rules that allow Outlook on Windows devices for Exchange ActiveSync connectivity (WindowsMail refers to the Mail app included in Windows 10):

   ```
   New-ActiveSyncDeviceAccessRule -Characteristic DeviceType -QueryString "WindowsMail" -AccessLevel Allow
   ```

Option 2: Block native Exchange ActiveSync apps on Android and iOS devices

Alternatively, you can block native Exchange ActiveSync apps on specific Android and iOS devices or other types of devices.

1. Confirm that there are no Exchange ActiveSync device access rules in place that block Outlook for iOS and Android:

   ```
   Get-ActiveSyncDeviceAccessRule | where {$_.AccessLevel -eq "Block" -and $_.QueryString -like "Outlook*"}
   | ft Name,AccessLevel,QueryString -auto
   ```

   If any device access rules that block Outlook for iOS and Android are found, type the following to remove them:

   ```
   Get-ActiveSyncDeviceAccessRule | where {$_.AccessLevel -eq "Block" -and $_.QueryString -like "Outlook*"}
   | Remove-ActiveSyncDeviceAccessRule
   ```

2. You can block most Android and iOS devices with the following commands:

   ```
   New-ActiveSyncDeviceAccessRule -Characteristic DeviceType -QueryString "Android" -AccessLevel Block
   New-ActiveSyncDeviceAccessRule -Characteristic DeviceType -QueryString "iPad" -AccessLevel Block
   New-ActiveSyncDeviceAccessRule -Characteristic DeviceType -QueryString "iPhone" -AccessLevel Block
   New-ActiveSyncDeviceAccessRule -Characteristic DeviceType -QueryString "iPod" -AccessLevel Block
   ```

3. Not all Android device manufacturers specify "Android" as the DeviceType. Manufacturers may specify a unique value with each release. In order to find other Android devices that are accessing your environment, execute the following command to generate a report of all devices that have an active Exchange ActiveSync

partnership:

```
Get-MobileDevice | Select-Object DeviceOS,DeviceModel,DeviceType | Export-CSV c:\temp\easdevices.csv
```

4. Create additional block rules, depending on your results from Step 3. For example, if you find your environment has a high usage of HTCOne Android devices, you can create an Exchange ActiveSync device access rule that blocks that particular device, forcing the users to use Outlook for iOS and Android. In this example, you would type:

```
New-ActiveSyncDeviceAccessRule -Characteristic DeviceType -QueryString "HTCOne" -AccessLevel Block
```

> **NOTE**
>
> The QueryString parameter does not accept wildcards or partial matches.

Additional resources:

- New-ActiveSyncDeviceAccessRule
- Get-MobileDevice
- Set-ActiveSyncOrganizationSettings

Blocking Outlook for iOS and Android

Every Exchange organization has different policies regarding security and device management. If an organization decides that Outlook for iOS and Android doesn't meet their needs or is not the best solution for them, administrators have the ability to block the app. Once the app is blocked, mobile Exchange users in your organization can continue accessing their mailboxes by using the built-in mail applications on iOS and Android.

The `New-ActiveSyncDeviceAccessRule` cmdlet has a `Characteristic` parameter, and there are three `Characteristic` options that administrators can use to block the Outlook for iOS and Android app. The options are UserAgent, DeviceModel, and DeviceType. In the two blocking options described in the following sections, you will use one or more of these characteristic values to restrict the access that Outlook for iOS and Android has to the mailboxes in your organization.

The values for each characteristic are displayed in the following table:

CHARACTERISTIC	STRING FOR IOS	STRING FOR ANDROID
DeviceModel	Outlook for iOS and Android	Outlook for iOS and Android
DeviceType	Outlook	Outlook
UserAgent	Outlook-iOS-Android/1.0	Outlook-iOS-Android/1.0

With the `New-ActiveSyncDeviceAccessRule` cmdlet, you can define a device access rule, using either the `DeviceModel` or `DeviceType` characteristic. In both cases, the access rule blocks Outlook for iOS and Android across all platforms, and will prevent any device, on both the iOS platform and Android platform, from accessing an Exchange mailbox via the app.

The following are two examples of a device access rule. The first example uses the `DeviceModel` characteristic; the second example uses the `DeviceType` characteristic.

```
New-ActiveSyncDeviceAccessRule -Characteristic DeviceType -QueryString "Outlook" -AccessLevel Block
```

```
New-ActiveSyncDeviceAccessRule -Characteristic DeviceModel -QueryString "Outlook for iOS and Android" -
AccessLevel Block
```

Default settings for Exchange virtual directories

8/3/2020 • 2 minutes to read • Edit Online

Exchange Server 2016 and Exchange Server 2019 automatically configure multiple Internet Information Services (IIS) virtual directories during the server installation. The tables in the following sections show the settings for the Client Access (frontend) services on Mailbox servers and the default IIS authentication and Secure Sockets Layer (SSL) settings.

Client Access services (frontend) on Mailbox servers

The following table lists the default settings in the Client Access services (the default web site) on Exchange Mailbox servers.

VIRTUAL DIRECTORY	AUTHENTICATION METHOD	SSL SETTINGS	MANAGEMENT METHOD
Default Web Site	Anonymous	Required	IIS management console
API[1]	Anonymous authentication Windows authentication	SSL required Requires 128-bit encryption	
aspnet_client	Anonymous authentication	SSL required Requires 128-bit encryption	IIS management console
Autodiscover	Anonymous authentication Basic authentication Windows authentication	SSL required Requires 128-bit encryption	EAC or Exchange Management Shell
ecp	Anonymous authentication Basic authentication	SSL required Requires 128-bit encryption	EAC or Exchange Management Shell
EWS	Anonymous authentication Windows authentication	SSL required Requires 128-bit encryption	EAC or Exchange Management Shell
MAPI	Windows authentication	SSL required Requires 128-bit encryption	EAC or Exchange Management Shell
Microsoft-Server-ActiveSync	Basic authentication	SSL required Requires 128-bit encryption	EAC or Exchange Management Shell
OAB	Windows authentication	SSL required Requires 128-bit encryption	EAC or Exchange Management Shell
owa	Basic authentication	SSL required Requires 128-bit encryption	EAC or Exchange Management Shell
PowerShell	By default, all authentication methods are disabled.	Not required	EAC or Exchange Management Shell
Rpc	Basic authentication Windows authentication	Not required	EAC or Exchange Management Shell

[1] The API virtual directory is available in Exchange 2016 CU3 or newer.

Back End Virtual Directories on Mailbox servers

The following table lists the default settings in the back end services on Exchange Mailbox servers.

VIRTUAL DIRECTORY	AUTHENTICATION METHOD	SSL SETTINGS	MANAGEMENT METHOD
Exchange Back End	Anonymous authentication	SSL required Requires 128-bit encryption	This virtual directory should not be configured by the user.
API[1]	Anonymous authentication Windows authentication	SSL required Requires 128-bit encryption	This virtual directory should not be configured by the user.
Autodiscover	Anonymous authentication Windows authentication	SSL required Requires 128-bit encryption	This virtual directory should not be configured by the user.
ecp	Anonymous authentication Windows authentication	SSL required Requires 128-bit encryption	This virtual directory should not be configured by the user.
EWS	Anonymous authentication Windows authentication	SSL required Requires 128-bit encryption	This virtual directory should not be configured by the user.
Microsoft-Server-ActiveSync	Basic authentication	SSL required Requires 128-bit encryption	This virtual directory should not be configured by the user.
OAB	Windows authentication	SSL required Requires 128-bit encryption	This virtual directory should not be configured by the user.
owa	Anonymous authentication Windows authentication	SSL required Requires 128-bit encryption	This virtual directory should not be configured by the user.
PowerShell	Windows authentication	SSL required Requires 128-bit encryption	This virtual directory should not be configured by the user.
Rpc	Windows authentication	Not required	This virtual directory should not be configured by the user.
RpcWithCert	Windows authentication	Not required	This virtual directory should not be configured by the user.

[1]The API virtual directory is available in Exchange 2016 CU3 or newer.

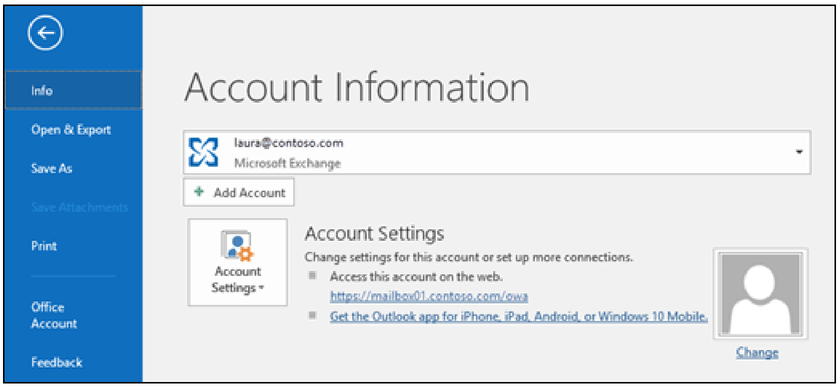
Outlook on the web in Exchange Server

8/3/2020 • 2 minutes to read • Edit Online

The user interface in Outlook on the web (formerly known as Outlook Web App) for Exchange Server has been optimized and simplified for use with phones and tablets. Supported web browsers give users access to more Outlook features. Unsupported web browsers give users the light version of Outlook on the web that has less features. For more information about features and supported web browsers, see Outlook on the web (formerly Outlook Web App) and Outlook on the web (formerly Outlook Web App).

When you install Exchange Server, Outlook on the web is automatically available for internal users at `https://<ServerName>/owa` (for example, `https://mailbox01.contoso.com/owa`). But, you'll likely want to configure Outlook on the web for external access (for example, `https://mail.contoso.com/owa`). For more information, see Step 4: Configure external URLs in Configure mail flow and client access on Exchange servers.

In an Outlook 2010 or later installation that's connected to an Exchange mailbox, you can typically see the Outlook on the web URL at **File** > **Info** > **Account Information** in the **Account Settings** section.



Account Information

laura@contoso.com
Microsoft Exchange

Account Settings

Change settings for this account or set up more connections.

- Access this account on the web.
  https://mailbox01.contoso.com/owa
- Get the Outlook app for iPhone, iPad, Android, or Windows 10 Mobile.

Outlook on the web is provided by the Client Access (frontend) services on Mailbox servers. In Exchange Server, Client Access services are part of the Mailbox server, so you can't configure a standalone Client Access server like you could in previous versions of Exchange. For more information, see Client access protocol architecture.

If you're looking for information about Outlook on the web in Microsoft 365 or Office 365, see Using email in Outlook on the web.

Administrative tasks for managing Outlook on the web

The configuration and management tasks that are documented for Outlook on the web in Outlook 2016 are listed in the following table.

TOPIC	DESCRIPTION
View or configure Outlook on the web virtual directories in Exchange Server	View and configure the properties of Outlook on the web for all users that connect to the server.
Configure http to https redirection for Outlook on the web in Exchange Server	Redirect Outlook on the web unencrypted http requests to https.
Create a theme for Outlook on the web in Exchange Server	Outlook on the web comes with built-in themes that define the colors and icons that are used in Outlook on the web, but you can also create your own themes.

TOPIC	DESCRIPTION
Customize the Outlook on the web sign-in, language selection, and error pages in Exchange Server	Customize key pages in Outlook on the web.
Use AD FS claims-based authentication with Outlook on the web	Centralize Outlook on the web authentication by using Active Directory Federation Services.

Enable or disable Outlook on the web access to mailboxes in Exchange Server

8/3/2020 • 5 minutes to read • Edit Online

Administrators can use the Exchange admin center (EAC) or the Exchange Management Shell to enable or disable Outlook on the web access to a mailbox. By default, users can access their mailboxes by using Outlook on the web. When you disable Outlook on the web access to mailboxes, users can still access their mailboxes by using Outlook or other email clients.

For additional management tasks related to user access to mailboxes, see these topics:

- Enable or disable Exchange ActiveSync access to mailboxes in Exchange Server
- Enable or disable POP3 or IMAP4 access to mailboxes in Exchange Server
- Enable or disable MAPI access to mailboxes in Exchange Server

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- For more information about accessing and using the EAC, see Exchange admin center in Exchange Server.
- To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Client Access user settings" entry in the Clients and mobile devices permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Enable or disable Outlook on the web access to a single mailbox

Use the EAC to Enable or disable Outlook on the web access to a single mailbox

1. In the EAC, go to **Recipients** > **Mailboxes**.
2. In the list of mailboxes, find the mailbox that you want to modify. You can:
   - Scroll through the list of mailboxes.
   - Click **Search** 🔍 and enter part of the user's name, email address, or alias.
   - Click **More options** ••• > **Advanced search** to find the mailbox.

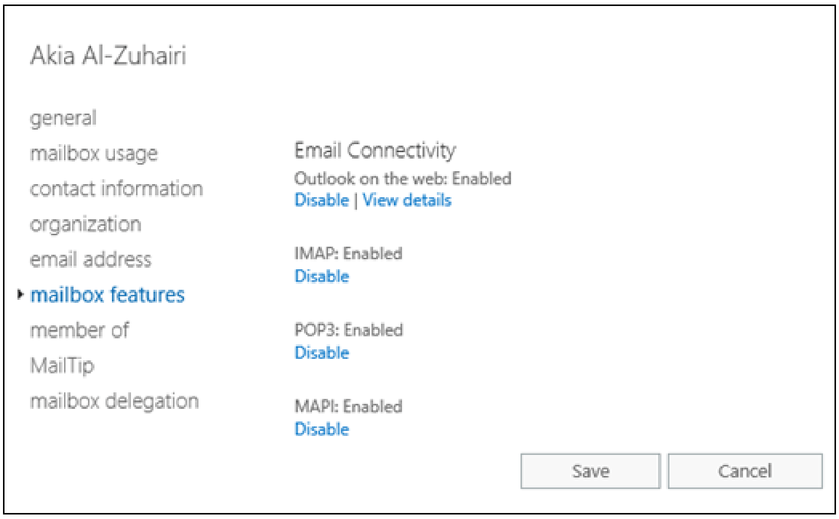
   Once you've found the mailbox that you want to modify, select it, and then click **Edit** ✎.

3. On the mailbox properties page that opens, click **Mailbox features**.

4. In the **Email Connectivity** section, configure one of these settings:

   - If you see **Outlook on the web: Enabled**, click **Disable** to disable it, and then click **Yes** in the warning message that appears.

   - If you see **Outlook on the web: Disabled**, click **Enable** to enable it.



Akia Al-Zuhairi

Email Connectivity

Outlook on the web: Enabled

IMAP: Enabled

POP3: Enabled

MAPI: Enabled

When you're finished, click **Save**.

Use the Exchange Management Shell to enable or disable Outlook on the web access to a mailbox

To enable or disable Outlook on the web access to a single mailbox, use this syntax:

```
Set-CasMailbox -Identity <MailboxIdentity> -OWAEnabled <$true | $false>
```

This example disables Outlook on the web access to the mailbox named Yan Li.

```
Set-CasMailbox -Identity "Yan Li" -OWAEnabled $false
```

This example enables Outlook on the web access to the mailbox named Elly Nkya.

```
Set-CasMailbox -Identity "Elly Nkya" -OWAEnabled $true
```

For detailed syntax and parameter information, see Set-CASMailbox.

Enable or disable Outlook on the web access to multiple mailboxes

Use the EAC to enable or disable Outlook on the web access to multiple mailboxes

1. In the EAC, go to **Recipients** > **Mailboxes**.

2. In the list of mailboxes, find the mailboxes that you want to modify. You can:

   - Scroll through the list of mailboxes.

   - Click **Search** 🔍 and enter part of the user's name, email address, or alias.

   - Click **More options** ••• > **Advanced search** to find the mailbox.

3. In the list of mailboxes, select multiple mailboxes of the same type (for example, **User**) from the list. For example:

- Select a mailbox, hold down the Shift key, and select another mailbox that's farther down in the list.
- Hold down the CTRL key as you select each mailbox.

After you select multiple mailboxes of the same type, the title of the details pane changes to **Bulk Edit**.

4. In the details pane, scroll down to **Outlook on the web**, click **Enable** or **Disable**, and then click **OK** in the warning message that appears.

Use the Exchange Management Shell to enable or disable Outlook on the web access to multiple mailboxes

You can use the **Get-Mailbox**, **Get-User** or **Get-Content** cmdlets to identify the mailboxes that you want to modify. For example:

- Use the *OrganizationalUnit* parameter to filter the mailboxes by organizational unit (OU).
- Use the *Filter* parameter to create OPATH filters that identify the mailboxes. For more information, see Filterable Properties for the -Filter Parameter.
- Use a text file to specify the mailboxes. The text file contains one mailbox (email address, name, or other unique identifier) on each line like this:

```
ebrunner@tailspintoys.com
fapodaca@tailspintoys.com
glaureano@tailspintoys.com
hrim@tailspintoys.com
```

This example disables Outlook on the web access to all user mailboxes in the North America\Finance OU.

```
$NAFinance = Get-Mailbox -OrganizationalUnit "OU=Marketing,OU=North America,DC=contoso,DC=com" -Filter
"RecipientTypeDetails -eq 'UserMailbox'" -ResultSize Unlimited; $NAFinance | foreach  {Set-CasMailbox
$_.Identity -OWAEnabled $false}
```

This example disables Outlook on the web access to all user mailboxes in the Engineering department in Washington state.

```
Get-User -Filter "RecipientType -eq 'UserMailbox' -and Department -like 'Engineering*' -and StateOrProvince -
eq 'WA'" | Set-CasMailbox -OWAEnabled $false
```

This example uses the text file C:\My Documents\Accounts.txt to disable Outlook on the web access to the specified mailboxes.

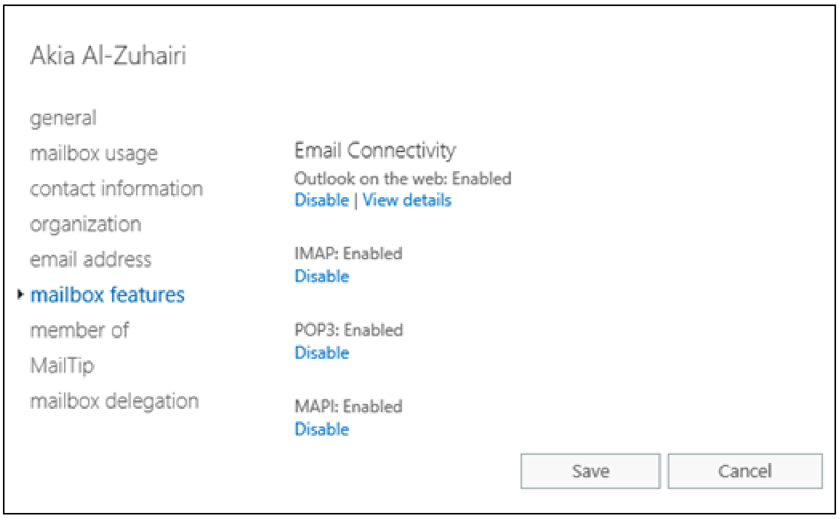
```
Get-Content "C:\My Documents\Accounts.txt" | foreach {Set-CasMailbox $_ -OWAEnabled $false}
```

For detailed syntax and parameter information, see Get-Mailbox and Get-User.

How do you know this worked?

To verify that you've successfully enabled or disabled Outlook on the web access to a mailbox, do any of these steps:

- In the EAC, go to **Recipients** > **Mailboxes** > select the mailbox > click **Edit** ✎ > **Mailbox features** and verify the **Outlook on the web** value in the **Email Connectivity** section.



Akia Al-Zuhairi

Email Connectivity

Outlook on the web: Enabled

IMAP: Enabled

POP3: Enabled

MAPI: Enabled

- In the Exchange Management Shell, replace *<MailboxIdentity>* with the identity of the mailbox (for example, name, alias, or email address), and run this command:

```
Get-CasMailbox -Identity "<MailboxIdentity>"
```

- Use the same filter that you used to identify the mailboxes, but use the **Get-CasMailbox** cmdlet instead of **Set-CasMailbox**. For example:

```
Get-User -Filter "RecipientType -eq 'UserMailbox' -and Department -like 'Engineering*' -and
StateOrProvince -eq 'WA'" | Get-CasMailbox
```

- In the Exchange Management Shell, run this command to show all mailboxes where Outlook on the web access is disabled:

```
Get-CasMailbox -ResultSize unlimited -Filter "OWAEnabled -eq `$false"
```

View or configure Outlook on the web virtual directories in Exchange Server

8/3/2020 • 10 minutes to read • Edit Online

You can use the Exchange admin center (EAC) or the Exchange Management Shell to view or modify the properties of an Outlook on the web (formerly known as Outlook Web App) virtual directory. Although the name has changed to Outlook on the web, the name of the virtual directory is still "owa".

What do you need to know before you begin?

- Estimated time to complete each procedure: 10 minutes.
- For more information about the EAC, see .Exchange admin center in Exchange Server. To learn how to open the Exchange Management Shell in your on-premises Exchange organization, see Open the Exchange Management Shell.
- Secure Sockets Layer (SSL) is being replaced by Transport Layer Security (TLS) as the protocol that's used to encrypt data sent between computer systems. They're so closely related that the terms "SSL" and "TLS" (without versions) are often used interchangeably. Because of this similarity, references to "SSL" in Exchange topics, the Exchange admin center, and the Exchange Management Shell have often been used to encompass both the SSL and TLS protocols. Typically, "SSL" refers to the actual SSL protocol only when a version is also provided (for example, SSL 3.0). To find out why you should disable the SSL protocol and switch to TLS, check out Protecting you against the SSL 3.0 vulnerability.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Outlook on the web virtual directories" entry in the Clients and mobile devices permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**

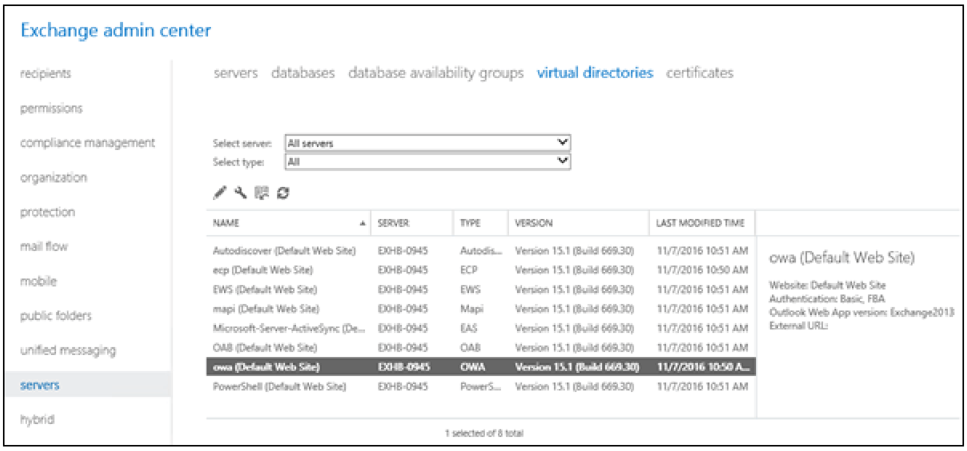
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the EAC to view or configure Outlook on the web virtual directory properties

1. In the EAC, go to **Servers** > **Virtual directories**.



Select server: All servers

Select type: All

NAME	SERVER	TYPE	VERSION	LAST MODIFIED TIME
Autodiscover (Default Web Site)	EXHB-0945	Autodis...	Version 15.1 (Build 669.30)	11/7/2016 10:51 AM
ecp (Default Web Site)	EXHB-0945	ECP	Version 15.1 (Build 669.30)	11/7/2016 10:50 AM
EWS (Default Web Site)	EXHB-0945	EWS	Version 15.1 (Build 669.30)	11/7/2016 10:51 AM
mapi (Default Web Site)	EXHB-0945	Mapi	Version 15.1 (Build 669.30)	11/7/2016 10:51 AM
Microsoft-Server-ActiveSync (De...	EXHB-0945	EAS	Version 15.1 (Build 669.30)	11/7/2016 10:51 AM
OAB (Default Web Site)	EXHB-0945	OAB	Version 15.1 (Build 669.30)	11/7/2016 10:51 AM
owa (Default Web Site)	EXHB-0945	OWA	Version 15.1 (Build 669.30)	11/7/2016 10:50 A...
PowerShell (Default Web Site)	EXHB-0945	PowerS...	Version 15.1 (Build 669.30)	11/7/2016 10:51 AM

owa (Default Web Site)

Website: Default Web Site
Authentication: Basic, FBA
Outlook Web App version: Exchange2013
External URL:

1 selected of 8 total

2. Select the Outlook on the web virtual directory you want to view or configure.

   - You can use the **Select server** drop down list to filter the Exchange servers by name.

   - To only display Outlook on the web virtual directories, select **OWA** in the **Select type** drop down list.

   After you select the virtual directory, you can see the following properties and values in the feature pane:

   - **Website** (read-only): The default web site is named **Default Web Site**.

   - **Authentication**: The default authentication methods are **Basic** and **FBA** (forms-based authentication).

   - **Outlook on the web version**: The default version is `Exchange2013`.

   - **External URL**: The default value is blank (not configured).

3. To see more properties, or to modify the settings that aren't read only, click **Edit** (✎). The following tabs and settings are available:

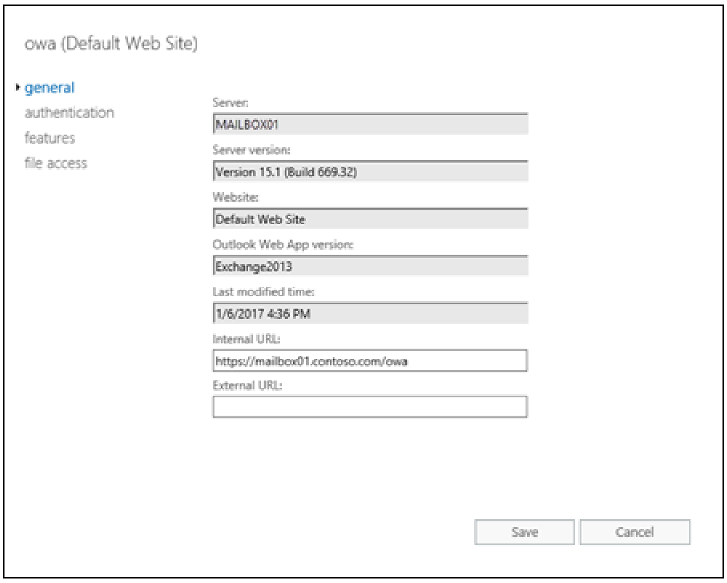
   - **General** tab:

     - **Internal URL**: The URL that's used to access Outlook on the web from the internal network. This value is configured automatically during Exchange Server setup, and the default value is https:// *<Server FQDN>*/owa (for example, https://mailbox01.contoso.com/owa).

     - **External URL**: The URL that's used to access Outlook on the web from the Internet. The default value is blank.

       For Internet-facing Exchange servers, this is the value that clients use to access Outlook on the web. To configure this setting, see the Use the EAC to configure the external URL for Outlook on the web section in this topic.

       For Exchange servers that don't have an Internet presence, the leave the **External URL** value blank.



owa (Default Web Site)

Server:
MAILBOX01

Server version:
Version 15.1 (Build 669.32)

Website:
Default Web Site

Outlook Web App version:
Exchange2013

Last modified time:
1/6/2017 4:36 PM

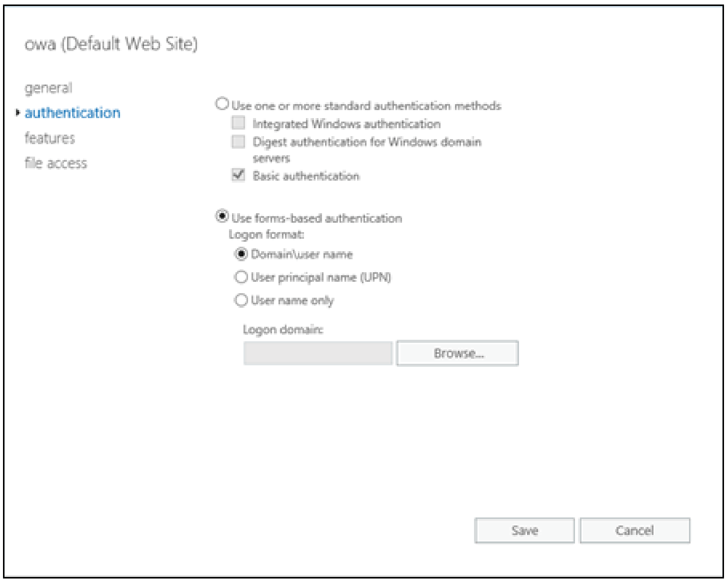
Internal URL:
https://mailbox01.contoso.com/owa

External URL:

- **Authentication** tab:
  - **Use one or more standard authentication methods**: Select this option to use one or more of the following authentication methods:
  - **Integrated Windows authentication**: This method requires that users have a valid Active Directory user account, and the client computer is a member of the same domain as the Exchange server (or a domain that's trusted by the Exchange server's domain). Users aren't prompted for their account names and passwords. Instead, the server negotiates with the Windows security packages that are installed on the client computer. No unencrypted information is transmitted over the network.
  - **Digest authentication for Windows domain servers**: This method requires that users have a valid Active Directory user account. Passwords are transmitted over the network as a hash value for additional security.
  - **Basic authentication (password is sent in clear text)**: This is the default value. When you use basic authentication, you should require TLS encrypted connections between client computers and the Exchange server.
  - **Use forms-based authentication**: Forms-based authentication provides enhanced security and allows you to configure the type of prompt that's used to sign-in. However, forms-based authentication won't provide a secure channel unless TLS is enabled.

    Select one of the following logon formats to use with forms-based authentication. The examples use the account for the user named Valeria Barrios in the contoso.com domain.

    - **Domain\user name** For example, CONTOSO\VBarrios. This is the default value.
    - **User principal name (UPN)** For example, vbarrios@contoso.com. Note that if the UPN doesn't match the email address, users can't access Outlook on the web by using this method.
    - **Username only** For example, VBarrios. This setting requires you to configure the default domain that's used with all user names. Click **Browse** in the **Logon Domain** property to select the default Active Directory domain. If the user isn't a member of the specified domain, they're required to enter the domain and username when they sign in.



owa (Default Web Site)

○ Use one or more standard authentication methods:

- □ Integrated Windows authentication
- □ Digest authentication for Windows domain servers
- ☑ Basic authentication

● Use forms-based authentication

Logon format:

- ● Domain\user name
- ○ User principal name (UPN)
- ○ User name only

Logon domain:

- **Features** tab:

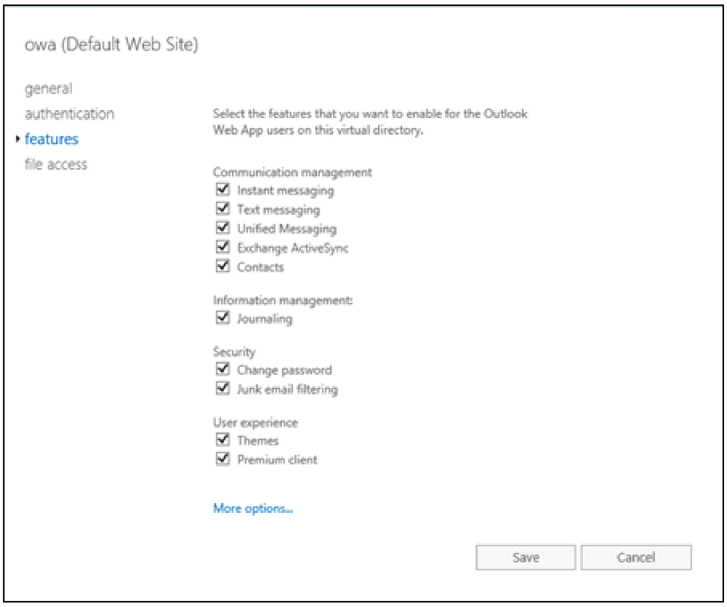
  These settings affect all users who connect to the Outlook on the web virtual directory. You can configure custom Outlook on the web settings for specific users or groups of users by using Outlook on the web mailbox policies. For more information, see View or configure Outlook on the web mailbox policy properties.

  - **Communication management**
  - **Instant messaging**
  - **Text messaging**
  - **Unified Messaging**: (In Exchange 2016 only; not available in Exchange 2019)
  - **Exchange ActiveSync**
  - **Contacts**
  - **All address lists***
  - **Information management**
  - **Journaling**
  - **Inbox rules***
  - **Recover deleted items***: Disabling this setting doesn't affect the deleted item retention for mailboxes; it prevents users from viewing or recovering deleted items in Outlook on the web.
  - **Security**
  - **Change password**
  - **Junk email-filtering**: This setting doesn't enable or disable the junk email rule in mailboxes; it controls the *availability* of the junk email settings for users in Outlook on the web. For more information about the junk email rule and junk email filtering in mailboxes, see Configure Exchange antispam settings on mailboxes.
  - **User experience**
  - **Themes**
  - **Premium client**: If you uncheck this setting, The standard version of Outlook on the web (formerly known as the premium version of Outlook Web App) is disabled, and all clients are

  forced to use the light version of Outlook on the web.

  - **Email signature***
  - **Time management***
  - **Calendar***
  - **Tasks***
  - **Reminders and notifications***

  * These settings are available after you click **More options**.



owa (Default Web Site)

file access

Select the features that you want to enable for the Outlook Web App users on this virtual directory.

Communication management
☑ Instant messaging
☑ Text messaging
☑ Unified Messaging
☑ Exchange ActiveSync
☑ Contacts

Information management:
☑ Journaling

Security
☑ Change password
☑ Junk email filtering

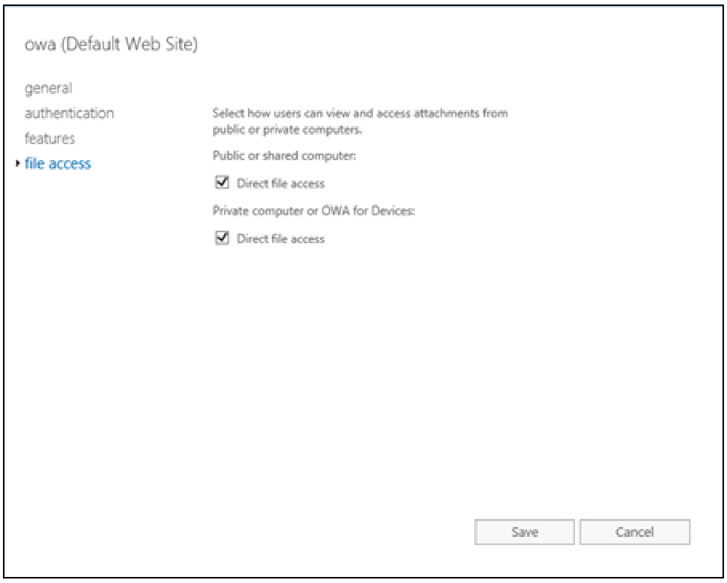
User experience
☑ Themes
☑ Premium client

- **File access** tab:

  The direct file access settings on this page affect traditional file attachments that you click on to open or save, or MIME files (typically, image files) that are embedded directly in the message. Disabling direct file access doesn't affect file access in other email clients (for example, in Outlook), or by using other access methods in Outlook on the web (for example, web document access that's provided by Office Online Server, or links to files in the cloud).

  Note that users can select public or private computer access in Outlook on the web only when the virtual directory is configured for forms-based authentication. All other authentication methods automatically use private computer access.

  - **Direct file access** for public or shared computers.
  - **Direct file access** for private computers.



Select how users can view and access attachments from public or private computers.

Public or shared computer:

☑ Direct file access

Private computer or OWA for Devices:

☑ Direct file access

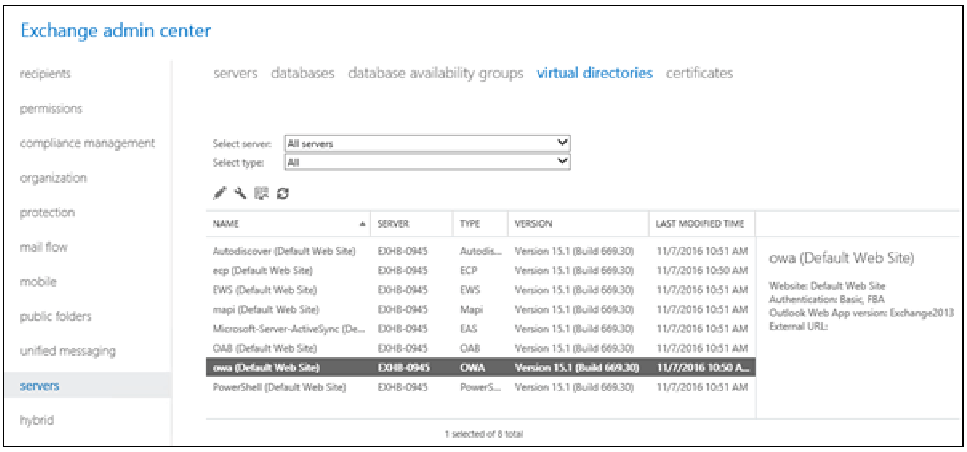
4. If you changed any of the virtual directory settings, click **Save**. If you're just browsing, click **Cancel**.

Use the EAC to configure the external URL for Outlook on the web

1. In the EAC, go to **Servers** > **Virtual directories**, select the Outlook on the web virtual directory you want to view or configure, and then click **Configure** (🔧).

   - You can use the **Select server** drop down list to filter the Exchange servers by name.

   - To only display Outlook on the web virtual directories, select **OWA** in the **Select type** drop down list.



Select server: All servers

Select type: All

NAME	SERVER	TYPE	VERSION	LAST MODIFIED TIME
Autodiscover (Default Web Site)	EXHB-0945	Autodis...	Version 15.1 (Build 669.30)	11/7/2016 10:51 AM
ecp (Default Web Site)	EXHB-0945	ECP	Version 15.1 (Build 669.30)	11/7/2016 10:50 AM

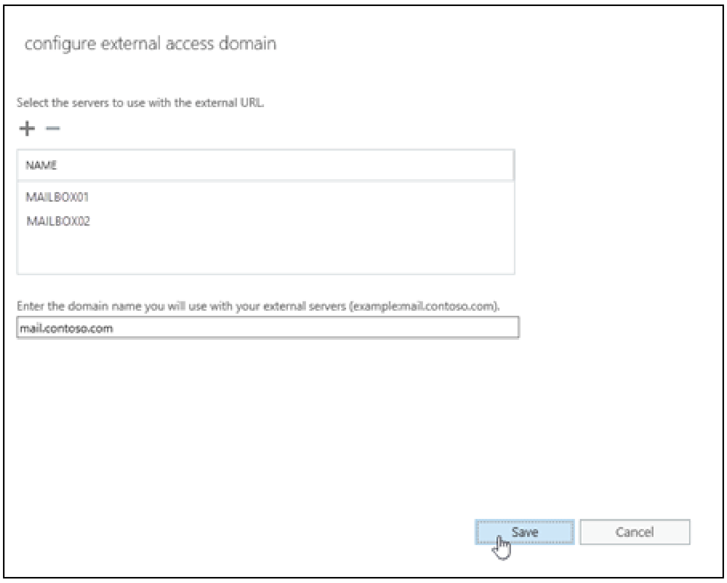
2. In the **Configure external access domain** page that opens, configure the following settings:

   - **Select the servers to use with the external URL**: Click **Add** (+) and select one or more Exchange servers that external clients will use to connect to Outlook on the web (don't select internal only servers).

   - **Enter the domain name you will use with your external servers**: Enter the FQDN that external clients will use to connect to Outlook on the web (for example, mail.contoso.com). Note that this value needs to be configured and resolvable in your organization's public DNS.

   When you're finished, click **Save**.



configure external access domain

Select the servers to use with the external URL.

NAME
MAILBOX01
MAILBOX02

Enter the domain name you will use with your external servers (example:mail.contoso.com).

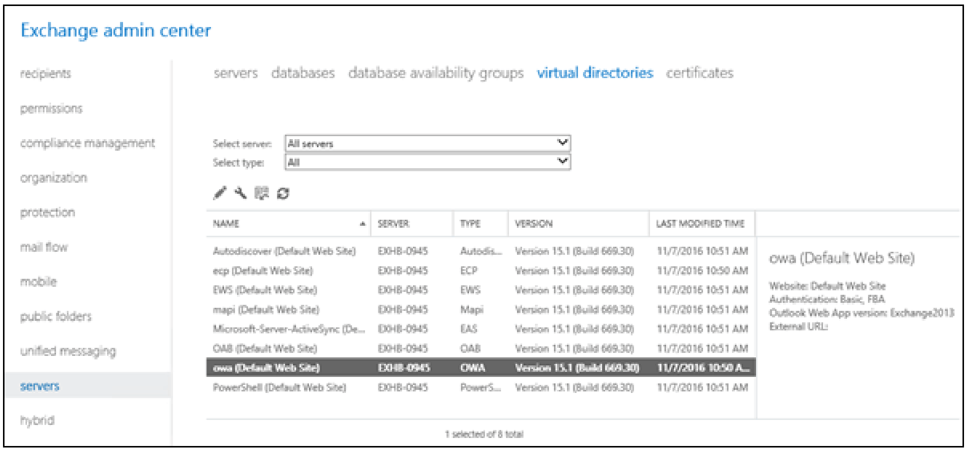
mail.contoso.com

Reset an Outlook on the web virtual directory

If an Outlook on the web virtual directory isn't working the way you expect, you can reset it. The virtual directory is deleted and recreated with the default settings. Although any customized settings are lost, you're forced to select a location for a text document to backup the current settings.

1. In the EAC, go to **Servers** > **Virtual directories**, select the Outlook on the web virtual directory you want to view or configure, and then click **Reset** (▦).

   - You can use the **Select server** drop down list to filter the Exchange servers by name.
   - To only display Outlook on the web virtual directories, select **OWA** in the **Select type** drop down list.



Select server: All servers

Select type: All

NAME	SERVER	TYPE	VERSION	LAST MODIFIED TIME
Autodiscover (Default Web Site)	EXHB-0945	Autodis...	Version 15.1 (Build 669.30)	11/7/2016 10:51 AM
ecp (Default Web Site)	EXHB-0945	ECP	Version 15.1 (Build 669.30)	11/7/2016 10:50 AM
EWS (Default Web Site)	EXHB-0945	EWS	Version 15.1 (Build 669.30)	11/7/2016 10:51 AM
mapi (Default Web Site)	EXHB-0945	Mapi	Version 15.1 (Build 669.30)	11/7/2016 10:51 AM
Microsoft-Server-ActiveSync (De...	EXHB-0945	EAS	Version 15.1 (Build 669.30)	11/7/2016 10:51 AM

owa (Default Web Site)	EXHB-0945	OWA	Version 15.1 (Build 669.30)	11/7/2016 10:50 A...
PowerShell (Default Web Site)	EXHB-0945	PowerS...	Version 15.1 (Build 669.30)	11/7/2016 10:51 AM

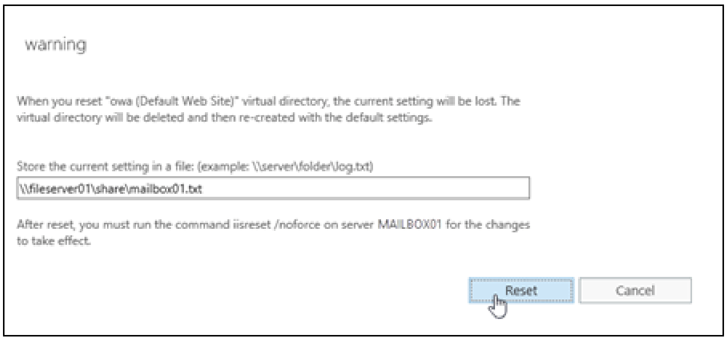
owa (Default Web Site)

Website: Default Web Site
Authentication: Basic, FBA
Outlook Web App version: Exchange2013
External URL:

1 selected of 8 total

2. In the **Warning** page that opens, specify the UNC path of the file to save the current virtual directory settings (for example, \ *<Server>*\ *<Share>*\owavdir.txt or \ *<LocalServerName>*\c$\owavdir.txt).

   When you're finished, click **Reset**.



warning

When you reset "owa (Default Web Site)" virtual directory, the current setting will be lost. The virtual directory will be deleted and then re-created with the default settings.

Store the current setting in a file: (example: \\server\folder\log.txt)

\\fileserver01\share\mailbox01.txt

After reset, you must run the command iisreset /noforce on server MAILBOX01 for the changes to take effect.

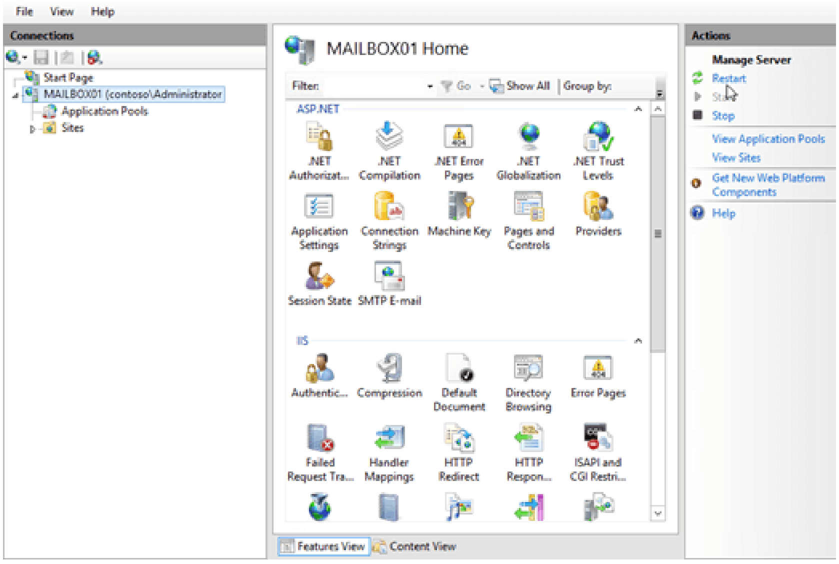
3. Restart IIS by using either of the following methods:

- IIS Manager:

   a. Open IIS Manager on the Exchange server. An easy way to do this in Windows Server 2012 or later is to press Windows key + Q, type inetmgr, and select **Internet Information Services (IIS) Manager** in the results.

   b. In IIS Manager, select the server.

   c. In the **Actions** pane, click **Restart**.



- Command prompt:

Open an elevated command prompt on the Exchange server (a Command Prompt window you open by selecting **Run as administrator**) and run the following commands:

```
net stop w3svc /y
```

```
net start w3svc
```

Use the Exchange Management Shell to view Outlook on the web virtual directory properties

To use the Exchange Management Shell to view the properties of Outlook on the web virtual directories, use the following syntax:

```
Get-OWAVirtualDirectory [-Identity "<ExchangeServer>\owa <Website>"]
```

This example returns a summary list of all Outlook on the web virtual directories on all Exchange servers in the organization.

```
Get-OWAVirtualDirectory
```

This example returns detailed information for the Outlook on the web virtual directory in the default website on the Exchange server named Mailbox01.

```
Get-OWAVirtualDirectory -Identity "Mailbox01\owa (Default Web Site)" | Format-List
```

This example returns the authentication methods and settings for the same virtual directory:

```
Get-OWAVirtualDirectory -Identity "Mailbox01\owa (Default Web Site)" | Format-List *Authentication*
```

Note: Not every setting is applicable to Exchange 2016 or Exchange 2019 (for example, **SpellCheckerEnabled**).

For detailed syntax and parameter information, see Get-OWAVirtualDirectory.

Use the Exchange Management Shell to configure Outlook on the web virtual directory settings

There are many more configuration settings available for Outlook on the web virtual directories in the Exchange Management Shell (the **Set-OwaVirtualDirectory** cmdlet) than in the EAC. Hare are some of the Outlook on the web virtual directory settings that are only available in the Exchange Management Shell:

PARAMETER	FUNCTION
AllowedFileTypes *BlockedFileTypes* *ForceSaveFileTypes* *AllowedMimeTypes* *BlockedMimeTypes* *ForceSaveMimeTypes* *ActionForUnknownFileAndMIMETypes*	Defines the file types for direct file access (traditional file attachments an embedded MIME files) in Outlook on the web (not in other email clients).
DefaultTheme	Specifies the default theme that's used in Outlook on the web.
LogonAndErrorLanguage *OutboundCharset* *UseGB18030* *UseISO885915*	Configures the various language settings for Outlook on the web.
DisplayPhotosEnabled *SetPhotoEnabled* *SetPhotoURL*	Configures the user photo settings in Outlook on the web.

Note: Not all of the available parameters apply to Exchange 2016 or Exchange 2019 (for example, *SpellCheckerEnabled*).

To use the Exchange Management Shell to configure the properties of Outlook on the web virtual directories, use the following syntax:

```
Set-OWAVirtualDirectory -Identity "<ExchangeServer>\owa <Website>" <Settings>
```

This example enables configures direct file access in Outlook on the web to block file types that aren't specifically defined in the Allow list (the default action is allow).

```
Set-OwaVirtualDirectory -Identity "Contoso\owa (Default Web Site)" -ActionForUnknownFileAndMIMETypes Block
```

For detailed syntax and parameter information, see Set-OwaVirtualDirectory.

Configure http to https redirection for Outlook on the web in Exchange Server

8/3/2020 • 7 minutes to read • Edit Online

By default in Exchange Server, the URL https://*<ServerName>* redirects users to https://*<ServerName>*/owa. But, if anyone tries to access Outlook on the web (formerly known as Outlook Web App) by using http://*<ServerName>* or http://*<ServerName>*/owa, they'll get an error.

You can configure http redirection for Outlook on the web so that requests for http://*<ServerName>* or http://*<ServerName>*/owa are automatically redirected to https://*<ServerName>*/owa. This requires the following configuration steps in Internet Information Services (IIS):

1. Remove the **Require SSL** setting from the default website.

2. Restore the **Require SSL** setting on other virtual directories in the default website that had it enabled by default (except for /owa).

3. Configure the default website to redirect http requests to the /owa virtual directory.

4. Remove http redirection from all virtual directories in the default website (including /owa).

5. Reset IIS for the changes to take effect.

For the default SSL and http redirect settings on all virtual directories in the default website, see the Default Require SSL and HTTP Redirect settings in the default website on an Exchange server section at the end of this topic.

What do you need to know before you begin?

- Estimated time to complete this procedure: 15 minutes.

- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "IIS Manager" entry in the Outlook on the web permissions section of the Clients and mobile devices permissions topic.

- The procedures in this topic might cause a web.config file to be created in the folder `%ExchangeInstallPath%ClientAccess\OAB`. If you later remove http redirection for Outlook on the web, Outlook might freeze when users click **Send and Receive**. To prevent Outlook from freezing after you remove http redirection, delete the web.config file in `%ExchangeInstallPath%ClientAccess\OAB`.

- Secure Sockets Layer (SSL) is being replaced by Transport Layer Security (TLS) as the protocol that's used to encrypt data sent between computer systems. They're so closely related that the terms "SSL" and "TLS" (without versions) are often used interchangeably. Because of this similarity, references to "SSL" in Exchange topics, the Exchange admin center, and the Exchange Management Shell have often been used to encompass both the SSL and TLS protocols. Typically, "SSL" refers to the actual SSL protocol only when a version is also provided (for example, SSL 3.0). To find out why you should disable the SSL protocol and switch to TLS, check out Protecting you against the SSL 3.0 vulnerability.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

TIP

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

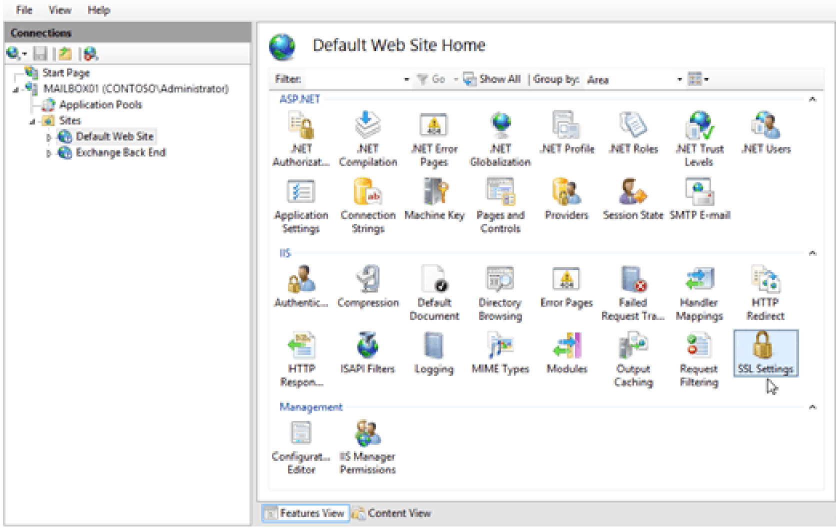
Step 1: Use IIS Manager to remove the Require SSL setting from the default website

1. Open IIS Manager on the Exchange server. An easy way to do this in Windows Server 2012 or later is to press Windows key + Q, type inetmgr, and select **Internet Information Services (IIS) Manager** in the results.

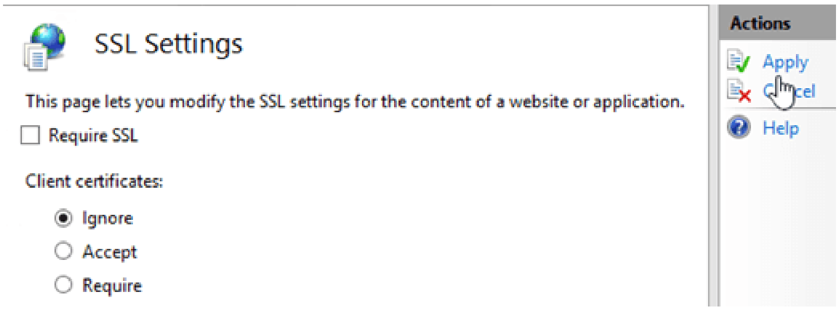
2. Expand the server, and expand **Sites**.

3. Select **Default Web Site**. and verify **Features View** is selected at the bottom of the page.

4. In the **IIS** section, double-click **SSL Settings**.



5. On the **SSL Settings** page, clear the **Require SSL** check box, and in the **Actions** pane, click **Apply**.



SSL Settings

This page lets you modify the SSL settings for the content of a website or application.

□ Require SSL

Client certificates:

● Ignore

○ Accept

○ Require

Note: To perform this procedure on the command line, open an elevated command prompt on the Exchange server (a Command Prompt window you open by selecting **Run as administrator**) and run the following command:

```
%windir%\system32\inetsrv\appcmd.exe set config "Default Web Site" -section:access -sslFlags:None -commit:APPHOST
```

Step 2: Use IIS Manager to restore the Require SSL setting on other virtual directories in the default website

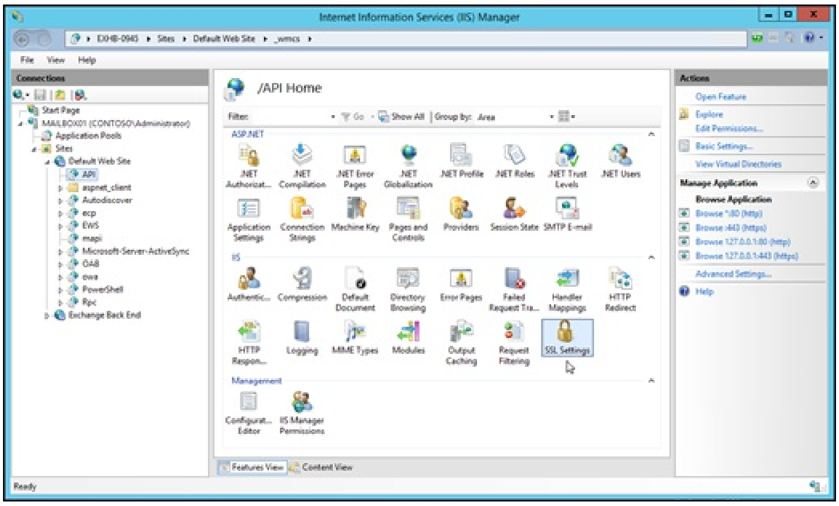
When you change the **Require SSL** setting on a website in IIS, the setting is automatically inherited by all virtual directories in the website. Because we're only interested in configuring Outlook on the web, you need to restore the **Require SSL** setting for other virtual directories that had it enabled by default.

Based on the information in the Default Require SSL and HTTP Redirect settings in the default website on an Exchange server section, use the following procedure to restore the setting on the other virtual directories where **Require SSL** was enabled by default:

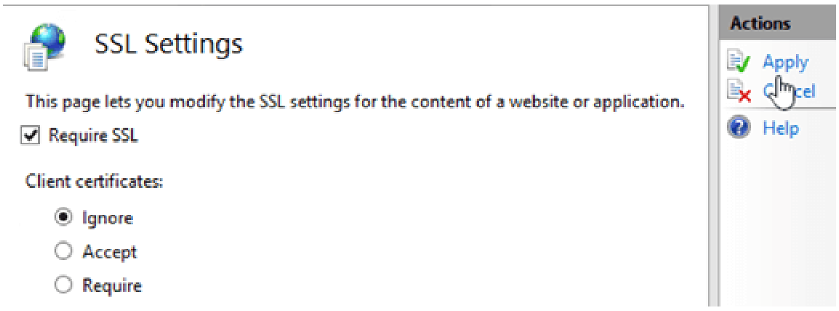
1. In IIS Manager, expand the server, expand **Sites**, and expand **Default Web Site**.

2. Select the virtual directory, and verify **Features View** is selected at the bottom of the page.

3. In the **IIS** section, double-click **SSL Settings**.



4. On the **SSL Settings** page, select the **Require SSL** check box, and in the **Actions** pane, click **Apply**.



This page lets you modify the SSL settings for the content of a website or application.

☑ Require SSL

Client certificates:

● Ignore
○ Accept
○ Require

5. Repeat the previous steps on each virtual directory in the default website that had **Require SSL** enabled by default (except for /owa). The only virtual directories that don't have **Require SSL** enabled by default are /PowerShell and /Rpc.

Note: To perform these procedures on the command line, replace *<VirtualDirectory>* with the name of the virtual directory, and run the following command in an elevated command prompt:

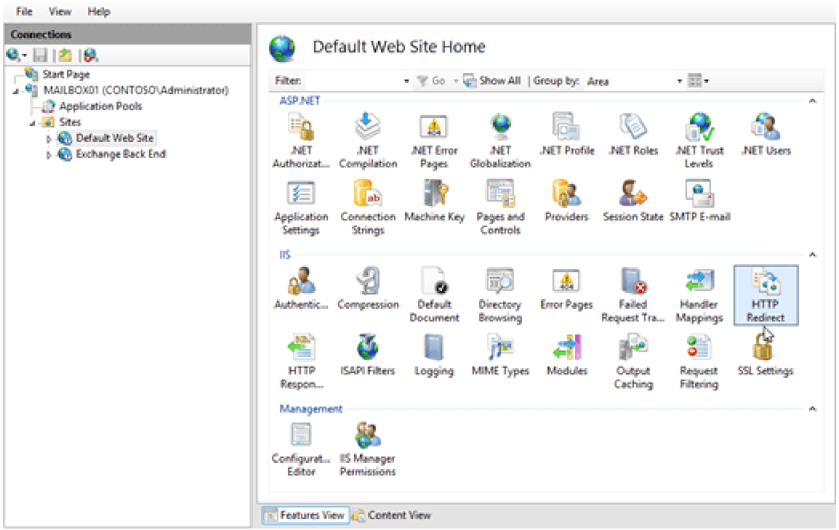
```
%windir%\system32\inetsrv\appcmd.exe set config "Default Web Site/<VirtualDirectory>" -section:Access -
sslFlags:Ssl,Ssl128 -commit:APPHOST
```

Step 3: Use IIS Manager to configure the default website to redirect to the /owa virtual directory.

1. In IIS Manager, expand the server, and expand **Sites**.

2. Select **Default Web Site**. and verify **Features View** is selected at the bottom of the page.

3. In the **IIS** section, double-click **HTTP Redirect**.



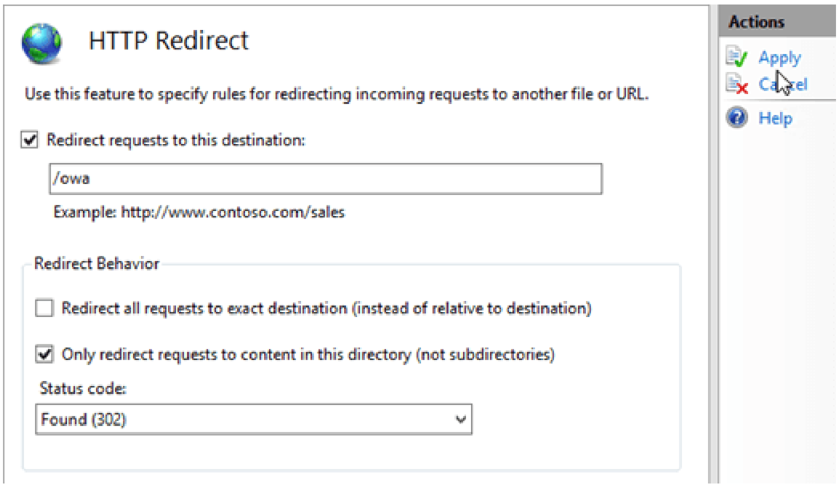
4. On the **HTTP Redirect** page, configure the following settings:

5. Select the **Redirect requests to this destination** check box, and enter the value https:// *<OWAUrl>*/owa (For example, https://webmail.contoso.com/owa).

6. In the **Redirect Behavior** section, select the **Only redirect requests to content in this directory (not subdirectories)** check box.

7. In the **Status code** list, verify **Found (302)** is selected.

   When you're finished, click **Apply** in the **Actions** pane.



HTTP Redirect

Use this feature to specify rules for redirecting incoming requests to another file or URL.

☑ Redirect requests to this destination:

/owa

Example: http://www.contoso.com/sales

Redirect Behavior

□ Redirect all requests to exact destination (instead of relative to destination)

☑ Only redirect requests to content in this directory (not subdirectories)

Status code:

Found (302)

Note: To perform this procedure on the command line, replace *<OWAUrl>* with the URL of the OWA virtual directory, open an elevated command prompt and run the following command:

```
%windir%\system32\inetsrv\appcmd.exe set config "Default Web Site" -section:httpredirect -enabled:true -
destination:"https://<OWAUrl>/owa" -childOnly:true
```

Step 4: Use IIS Manager to remove http redirection from all virtual directories in the default website

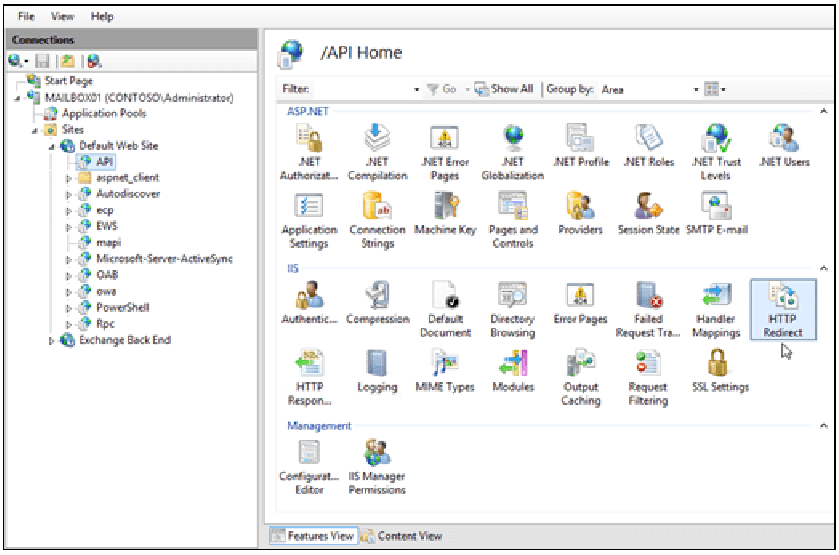
When you enable redirection on a website in IIS, the setting is automatically inherited by all virtual directories in the website. Because we're only interested in configuring redirection for the default website, you need to remove the redirect setting from all virtual directories. By default, no directories or virtual directories in the default website are enabled for redirection. For more information, see the Default Require SSL and HTTP Redirect settings in the default website on an Exchange server section.

Use the following procedure to remove the redirect setting from all virtual directories in the default website (including /owa):

1. In IIS Manager, expand the server, expand **Sites**, and expand **Default Web Site**.

2. Select the virtual directory, and verify **Features View** is selected at the bottom of the page.

3. In the **IIS** section, double-click **HTTP Redirect**.

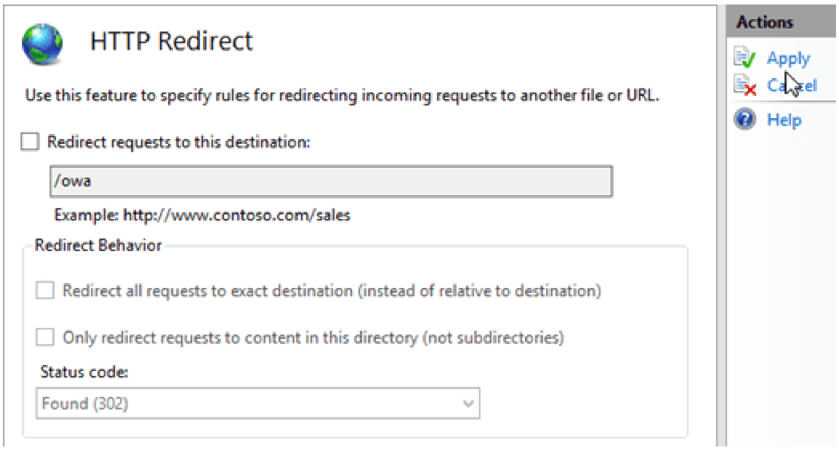


4. On the **HTTP Redirect** page, change the following settings:

5. Clear the **Only redirect requests to content in this directory (not subdirectories)** check box.

6. Clear the **Redirect requests to this destination** check box.

7. In the **Actions** pane, click **Apply**.



HTTP Redirect

Use this feature to specify rules for redirecting incoming requests to another file or URL.

□ Redirect requests to this destination:

/owa

Example: http://www.contoso.com/sales

Redirect Behavior

□ Redirect all requests to exact destination (instead of relative to destination)

□ Only redirect requests to content in this directory (not subdirectories)

Status code:

Found (302)

8. Repeat the previous steps on each virtual directory in the default website.

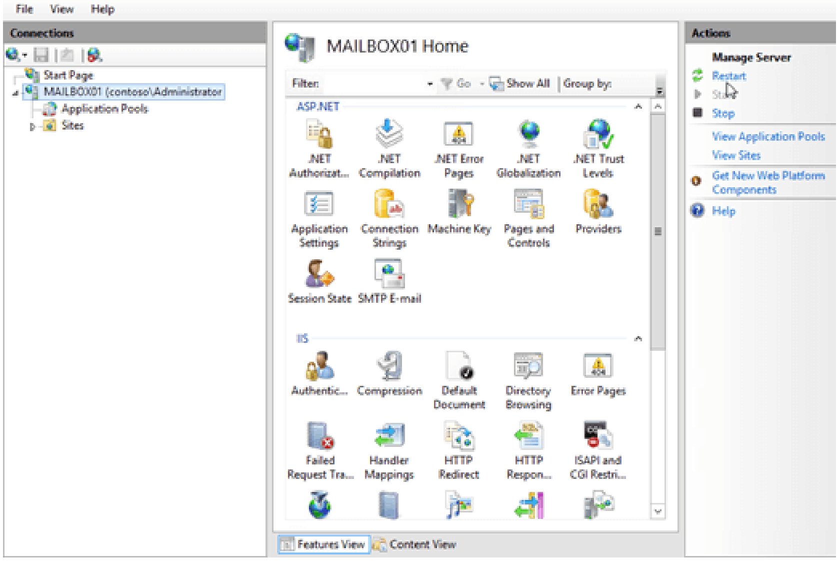
Note: To perform these procedures on the command line, replace *<VirtualDirectory>* with the name of the virtual directory, and run the following command in an elevated command prompt:

```
%windir%\system32\inetsrv\appcmd.exe set config "Default Web Site/<VirtualDirectory>" -section:httpredirect -
enabled:false -destination:"" -childOnly:false
```

Step 5: Use IIS Manager to restart IIS

1. In IIS Manager, select the server.

2. In the **Actions** pane, click **Restart**.



Note: To perform this procedure on the command line, open an elevated command prompt on the Exchange server and run the following commands:

```
net stop w3svc /y
```

```
net start w3svc
```

How do you know this worked?

To verify that you have successfully configured http to https redirection for Outlook on the web, perform the following steps:

1. On a client computer, open a web browser and enter the URL http://*<ServerName>*. On the local server, you can use the value http://127.0.0.1 or http://localhost.

2. Verify that you're redirected to Outlook on the web in https, and verify that you can log in successfully.

3. Open the URL http://*<ServerName>*/owa (or http://127.0.0.1/owa or http://localhost/owa).

4. Verify that you're redirected to Outlook on the web in https, and verify that you can log in successfully.

Default Require SSL and HTTP Redirect settings in the default website on an Exchange server

The default **Require SSL** and **HTTP Redirect** settings for the default website and all virtual directories in the default website on an Exchange server are described in the following table.

WEBSITE	VIRTUAL DIRECTORY	REQUIRE SSL	HTTP REDIRECT
Default Web Site	n/a	yes	none
Default Web Site	API	yes	none
Default Web Site	aspnet_client (directory)	yes	none

WEBSITE	VIRTUAL DIRECTORY	REQUIRE SSL	HTTP REDIRECT
Default Web Site	Autodiscover	yes	none
Default Web Site	ecp	yes	none
Default Web Site	EWS	yes	none
Default Web Site	mapi	yes	none
Default Web Site	Microsoft-Server-ActiveSync	yes	none
Default Web Site	OAB	yes	none
Default Web Site	owa	yes Subdirectories: • auth: yes • Calendar: no • Integrated: yes • oma: yes	none
Default Web Site	PowerShell	no	none
Default Web Site	Rpc	no	none

View or configure Outlook on the web mailbox policy properties

8/3/2020 • 3 minutes to read • Edit Online

You can configure mailbox policies in Exchange Server for Outlook on the web through the Exchange admin center (EAC) or Exchange Management Shell. After you create an Outlook on the web mailbox policy, you can then configure a variety of options to control the features available to users in Outlook on the web. For example, you can enable or disable Inbox rules or create a list of allowed file types for attachments.

What do you need to know before you begin?

- Estimated time to complete each procedure: 3 minutes.
- To open the EAC, see Exchange admin center in Exchange Server. To open the Exchange Management Shell, see Open the Exchange Management Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Outlook on the web mailbox policies" entry in the Clients and mobile devices permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

TIP

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the EAC to view or configure Outlook on the web mailbox policies

1. In the EAC, click **Permissions** > **Outlook Web App policies**.
2. In the result pane, click to select the mailbox policy you want to view or configure.
3. Click **Edit**.
4. On the **General** tab, you can view and edit the name of the policy.
5. On the **Features** tab, use the check boxes to enable or disable features. By default, the most common features are displayed. To see all features that can be enabled or disabled, click **More options**.

   Notes:

   - Features settings for Outlook on the web mailbox policies override Outlook on the web virtual directory settings. You can change segmentation settings for individual users by using the **Set-CASMailbox** cmdlet in the Exchange Management Shell.
   - The option to enable or disable the standard version of Outlook on the web by using the **Premium client** check box has been deprecated and will be removed from the settings. The standard version of Outlook on the web is always enabled.
6. On the **File Access** tab, use the check boxes to configure the file access and viewing options for users. File

access lets a user open or view the contents of files attached to an email message.

File access can be controlled based on whether a user has signed in on a public or private computer. The option for users to select private computer access or public computer access is available only when you're using forms-based authentication. All other forms of authentication default to private computer access.

- **Direct file access**: Select this check box if you want to enable direct file access. Direct file access lets users open files attached to email messages.

- **WebReady Document Viewing**: Select this check box if you want to enable supported documents to be converted to HTML and displayed in a web browser.

- **Force WebReady Document Viewing when a converter is available**: Select this check box if you want to force documents to be converted to HTML and displayed in a web browser before users can open them in the viewing application. Documents can be opened in the viewing application only if direct file access has been enabled.

7. On the **Offline access** tab, use the option buttons to configure offline access availability.

8. Click **Save** to update the policy.

Use the Exchange Management Shell to view Outlook on the web mailbox policies

This example retrieves the properties of the Outlook on the web mailbox policy `Executives` in the organization `Fabrikam`.

```
Get-OwaMailboxPolicy -Identity Fabrikam\Executives
```

For more information about syntax and parameters, see Get-OwaMailboxPolicy.

Use the Exchange Management Shell to configure Outlook on the web mailbox policies

This example enables calendar access in the default mailbox policy.

```
Set-OwaMailboxPolicy -Identity Default -CalendarEnabled $true
```

For more information about syntax and parameters, see Set-OwaMailboxPolicy.

How do you know this worked?

To verify that you've successfully edited an Outlook on the web mailbox policy:

1. In the EAC, click **Permissions** > **Outlook Web App Policies**, and then choose a specific Outlook on the web mailbox policy.

2. Click **Edit** to view the properties of the mailbox policy.

3. Click **Save** or **Cancel** to close the properties page.

Outlook Web App mailbox policy procedures in Exchange 2013

Create a theme for Outlook on the web in Exchange Server

8/3/2020 • 11 minutes to read • Edit Online

A *theme* defines the colors, fonts, and images that are displayed to users in Outlook on the web (formerly known as Outlook Web App) in Exchange Server. Each theme is a collection of files that are stored on the Exchange server. The built-in themes are described in the Default Outlook on the web themes in Exchange Server section at the end of this topic.

The basic steps to create a new theme for Outlook on the web are:

1. Copy the folders and files of an existing theme, and rename the copied folders and files.
2. Configure the display name and sort order of the new theme.
3. Customize the new theme.
4. (Optional) Set the new theme as the default, and prevent users from selecting themes.
5. (Optional) Allow users to see and select the new theme
6. Restart IIS for the changes to take affect.

If you use multiple Exchange servers for Outlook on the web client connections, you need to copy the new theme to each server. You should also create a backup copy of the new theme so you can copy the files back after you reinstall or upgrade the Exchange server.

After you create a theme, you may also want to customize elements that are common to all themes. For more information, see Customize the Outlook on the web sign-in, language selection, and error pages in Exchange Server.

What do you need to know before you begin?

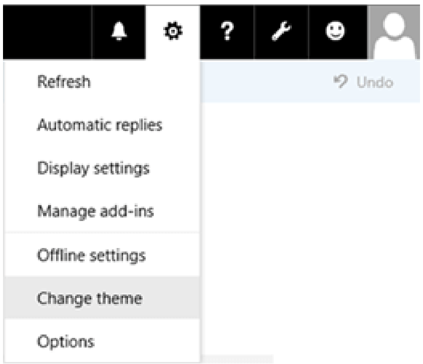
- Estimated time to complete this task: 45 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Outlook on the web virtual directories" entry in the Clients and mobile devices permissions topic. The account you use also needs to be a member of the local Administrators group on the Exchange server.
- The light version of Outlook on the web doesn't support themes.
- To replace an existing color with a new color, you need the HTML RGB value of the new color. You can find HTML RGB values at Color Table. If you can't find the color there, you can use an image editing tool or an HTML color codes web site to determine its HTML RGB value.
- Don't delete the folder `%ExchangeInstallPath%ClientAccess\OWA\prem\<ExchangeVersion>\resources\themes\base`, or any files in it.
- If you decide to directly edit an existing theme (not a copy of the theme), make a backup copy of the original files before you modify them.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

TIP

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server.

Step 1: Use File Explorer to copy the folders and files of an existing theme, and rename the copied folders and files

You can inspect the built-in themes by opening a mailbox in Outlook on the web, selecting **Settings**, and then selecting **Change theme**.



You can use the information in the Default Outlook on the web themes in Exchange Server section at the end of this topic to match the display name of the theme in Outlook on the web to the name of the theme folder on the Exchange server.

The theme files and folders are stored in the following locations:

- `%ExchangeInstallPath%ClientAccess\OWA\prem\<ExchangeVersion>\resources\themes\` contains the theme folder that holds the header image, theme preview image, and theme description text.

- `%ExchangeInstallPath%ClientAccess\OWA\prem\<ExchangeVersion>\resources\styles\` contains the `_fabric.color.variables.theme.<ThemeFolderName>.less` and `fabric.color.theme.<ThemeFolderName>.css` files that define the colors that are used in the theme.

  Note: The *<ExchangeVersion>* subfolder uses the syntax 15.1. *nnn*. *nn*, and indicates the Exchange Cumulative Update (CU) that's installed.

After you've identified the theme that's closest to what you want (for example, with or without a header image), you need to copy the theme folder and the corresponding files, and then rename the copied folders and files

1. In File Explorer, browse to `%ExchangeInstallPath%ClientAccess\OWA\prem\<ExchangeVersion>\resources\themes`.

2. Select an existing theme folder in the `\themes` folder, copy it, and then paste it back into the `\themes` folder. This results in a new folder named `<ThemeFolderName> - Copy`.

   Note: An easy way to copy and paste the theme folder is to select the folder, press the Control key + C, and then press the Control key + V.

3. Rename the new theme folder that you created in the previous step. For example, `fourthcoffee`.

   Note: An easy way to rename the folder is to select it, and then press the F2 key.

4. In File Explorer, browse to `%ExchangeInstallPath%ClientAccess\OWA\prem\<ExchangeVersion>\resources\styles\`.

5. Locate the files named `_fabric.color.variables.theme.<ThemeFolderName>.less` and `fabric.color.theme.<ThemeFolderName>.css` that correspond to the theme folder you copied in step 2. Select each file, copy it, and paste it back into the `\styles` folder. This results in new files named

`_fabric.color.variables.theme.<ThemeFolderName> - Copy.less` and `fabric.color.theme.<ThemeFolderName> - Copy.css`.

6. Rename the new files that you created in the previous step. The *<ThemeFolderName>* value must match the folder name from step 3. For example, `_fabric.color.variables.theme.fourthcoffee.less` and `fabric.color.theme.fourthcoffee.css`.

Step 2: Use Notepad to configure the display name and sort order of the new theme

You need to configure a unique display name and sort order for the new theme, because the new theme has the same display name and sort order as the theme you copied. The theme's display name appears in the **Change theme** panel in Outlook on the web. The sort order determines where the theme appears in the list of themes.

1. Use Notepad to open the file named `themeinfo.xml` in the new theme folder `%ExchangeInstallPath%ClientAccess\OWA\prem\<ExchangeVersion>\resources\themes\<NewThemeFolder>` that you created in Step 1. The contents of the file look like this:

   ```
   <theme displayname="__<CopiedThemeName>__" sortorder="<CopiedThemeSortOrder>"/>
   ```

2. Change the `displayname="__<CopiedThemeName>__"` value to the value you want. For example `displayname = "Fourth Coffee Corporate Theme"`.

   Note: The theme display name value `"__<ThemeName>__"` is a code string that's localized into different languages. The text value that you specify for the new theme isn't localized into different languages.

3. Change the `sortorder="<CopiedThemeSortOrder>"` integer value to the unique value you want. A lower value appears earlier in the list of themes. You can use the information in the Default Outlook on the web themes in Exchange Server section at the end of this topic to find the sort order values for the built-in themes. The Default theme has `sortorder="0"`, and appears first in the list.

   - If you want to insert your new theme among the list of built-in themes, change the number to a unique value that isn't already in use. For example, if you want your new theme to appear second in the list, you can use the value `sortorder="5"`.

   - If you want to *replace* the position of a built-in theme in the list, set the number to the same value as built-in theme, and then change the sort order for the built-in theme. For example, if you want your new theme to appear first in the list, you need to set your new theme to `sortorder="0"`. But, you also need to open the `themeinfo.xml` file in the `\base` folder (the Default theme) to change the value `sortorder="0"` to something else (for example, `sortorder="5")`.

4. When you're finished, save and close the `themeinfo.xml` file.

Step 3: Customize the new theme

Image files

Theme image files are stored in the following folders in `%ExchangeInstallPath%ClientAccess\OWA\prem\<ExchangeVersion>\resources\themes\<ThemeFolderName>`:

- `\images\0`: These files are used in left-to-right languages.

- `\images\rtl`: These files are used in right-to-left languages. Depending on the image, the file might be exactly the same as the left-to-right version, or it might be reversed (right-to-left instead of left-to-right).

The image files that exist in these folders are described in the following table:

FILE NAME	DIMENSIONS (WIDTH X HEIGHT IN PIXELS)	BIT DEPTH	DESCRIPTION
headerbgmaing2.png	2000 x 50	32	The header image for themes that use a static header image. The size of the file varies. If the theme doesn't use a static header image, the file is 1 x 1, and the size is 2815 bytes.
headerbgmaing2.gif	2000 x 50	24	The header image for themes that use an animated header image. The size of the file varies. If the theme doesn't use an animated header image, the file is 1 x 1, and the size is 43 bytes.
themepreview.png	64 x 64	24 or 8	The small square image that represents the theme in the **Change theme** panel in Outlook on the web. For the Default theme and the Black theme, this file 1 x 1, and the preview image is a black square.

You can edit the existing image file, or replace the file with a new file that has the same name and dimensions.

Colors

Theme colors are defined in the following files in the `%ExchangeInstallPath%ClientAccess\OWA\prem\<ExchangeVersion>\resources\styles` folder:

- `fabric.color.theme.<ThemeFolderName>.css`
- `_fabric.color.variables.<ThemeFolderName>.less`

If you change a color value, you need to change all references to the color in both files.

Step 4: (Optional) Set the default theme and prevent users from selecting a theme

Setting a new default theme only affects users who haven't manually selected their theme. To force all users to use the default theme, you also need to disable theme selection in Outlook on the web. These settings affect all users who connect to Outlook on the web through the Exchange server.

To set the default theme and prevent users from changing their theme in Outlook on the web, use the following syntax:

```
Set-OwaVirtualDirectory -Identity <VirtualDirectoryIdentity> -DefaultTheme <ThemeFolderName> -
ThemeSelectionEnabled $false
```

This example configures the theme folder named `fourthcoffee` as the default theme in Outlook on the web for the default website on the server named Mailbox01.

```
Set-OwaVirtualDirectory -Identity "Mailbox01\owa (Default Web Site)" -DefaultTheme fourthcoffee -
ThemeSelectionEnabled $false
```

Notes:

- By default, the value of the *DefaultTheme* parameter is blank (`$null`). This value indicates that no default theme is specified, and the theme named Default is used if the user hasn't manually selected a theme.
- Exchange doesn't validate the value that you specify for the *DefaultTheme* parameter. Make sure that the theme exists.
- To specify a default theme for specific users that overrides the default theme setting on the Outlook on the web virtual directory, use the *DefaultTheme* parameter on the **Set-OwaMailboxPolicy** cmdlet.

Step 5: (Optional) Allow users to select the new theme

If you don't want to force all users to use the new theme, you need to add the new theme to the `stylemanifest.xml` file so users can find and select it in the list of themes. The `stylemanifest.xml` file is located in `%ExchangeInstallPath%ClientAccess\OWA\prem\<ExchangeVersion>\manifests` .

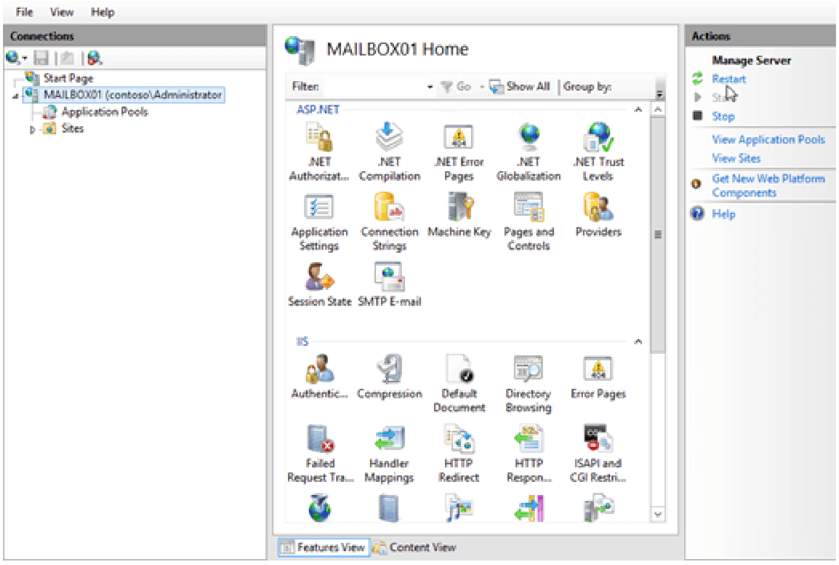
This example adds a new line in the `stylemanifest.xml` file for the new `fourthcoffee` theme.

```
<themeVariables themeName="fourthcoffee" fileName="_fabric.color.variables.theme.fourthcoffee.less" />
```

Step 6: Restart IIS

You need to restart Internet Information Services (IIS) for the changes to take effect.

1. Open IIS Manager on the Exchange server. An easy way to do this in Windows Server 2012 or later is to press Windows key + Q, type inetmgr, and select **Internet Information Services (IIS) Manager** in the results.
2. In IIS Manager, select the server.
3. In the **Actions** pane, click **Restart**.



Note: To perform this procedure on the command line, open an elevated command prompt on the Exchange server (a Command Prompt window you open by selecting **Run as administrator**) and run the following command:

```
net stop w3svc /y
```

```
net start w3svc
```

How do you know this worked?

To verify that you've successfully created an Outlook on the web theme, perform the following steps:

1. Open a mailbox in Outlook on the web. On the Exchange server, you can test your theme by opening the URL https://localhost/owa or https://127.0.0.1/owa.

2. Depending on the settings you configured, verify the new theme is used by default, or verify that you can see and select the new theme at **Settings** > **Change theme**.

3. If you don't see your changes after you restart IIS, clear your browsing history (delete temporary Internet files), and refresh the browser window.

Default Outlook on the web themes in Exchange Server

The built-in Outlook on the web themes are located in the folder `%ExchangeInstallPath%ClientAccess\OWA\prem\<ExchangeVersion>\resources\themes`, and are described in the following table.

FOLDER NAME	DISPLAY NAME IN OUTLOOK ON THE WEB	SORT ORDER IN OUTLOOK ON THE WEB (LOWER LISTED FIRST)	HEADER IMAGE TYPE

Customize the Outlook on the web sign-in, language selection, and error pages in Exchange Server

8/3/2020 • 3 minutes to read • Edit Online

The Outlook on the web (formerly known as Outlook Web App) sign-in, language selection, and error pages are based on image and content style sheet (CSS) files in the themes resources folder in the Client Access (front end) services on an Exchange Server 2016 or Exchange 2019 server. Outlook on the web uses only one set of sign-in, language selection, and error pages for all themes. Any modifications to those pages will be seen by all users who connect to the Exchange server for Outlook on the web.

Notes:

- Backup the default Outlook on the web files before you make any changes.
- Create a back-up copy of your customized files so you can reapply them after a reinstallation or upgrade of the Exchange server.
- If you use multiple Exchange servers for Outlook on the web connections, you need to copy the modified files to each server.

For more information about Outlook on the web, see Outlook on the web in Exchange Server. For information about creating a custom theme, see Create a theme for Outlook on the web in Exchange Server.

What do you need to know before you begin?

- Estimated time to complete this task: 30 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Graphics editor" entry under "Outlook on the web Permissions" in the Clients and mobile devices permissions topic.
- To replace the existing color with a new color, you need the HTML RGB value of the new color. You can find HTML RGB values in the topic Color Table. If you can't find the color there, you can use an image editing tool to sample a color and determine its HTML RGB value.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Customize the color of the Outlook on the web sign-in page

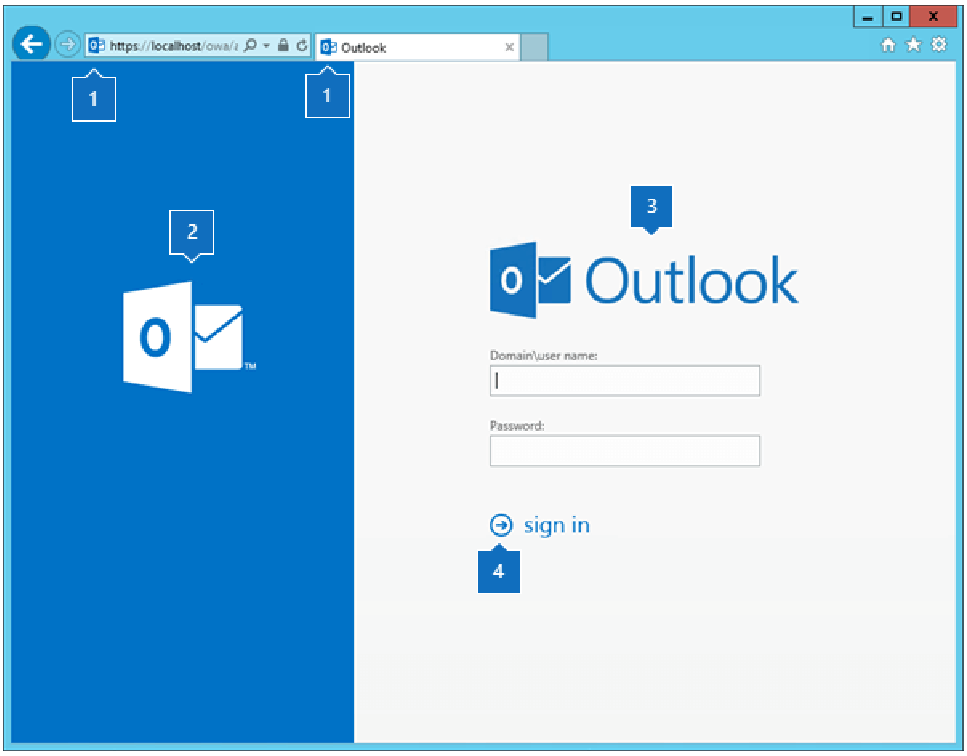
1. Use Notepad to open the file `%ExchangeInstallPath%FrontEnd\HttpProxy\owa\auth\<ExchangeVersion>\themes\resources\logon.css`.

   Note: The *<ExchangeVersion>* subfolder uses the syntax 15.1. *nnn*. *nn*, and changes every time you install an Exchange Cumulative Update (CU).

2. In the `logon.css` file, replace the default blue color value #0072c6 with the HTML RGB value that you want

to use.

3. When you're finished, save and close the file.

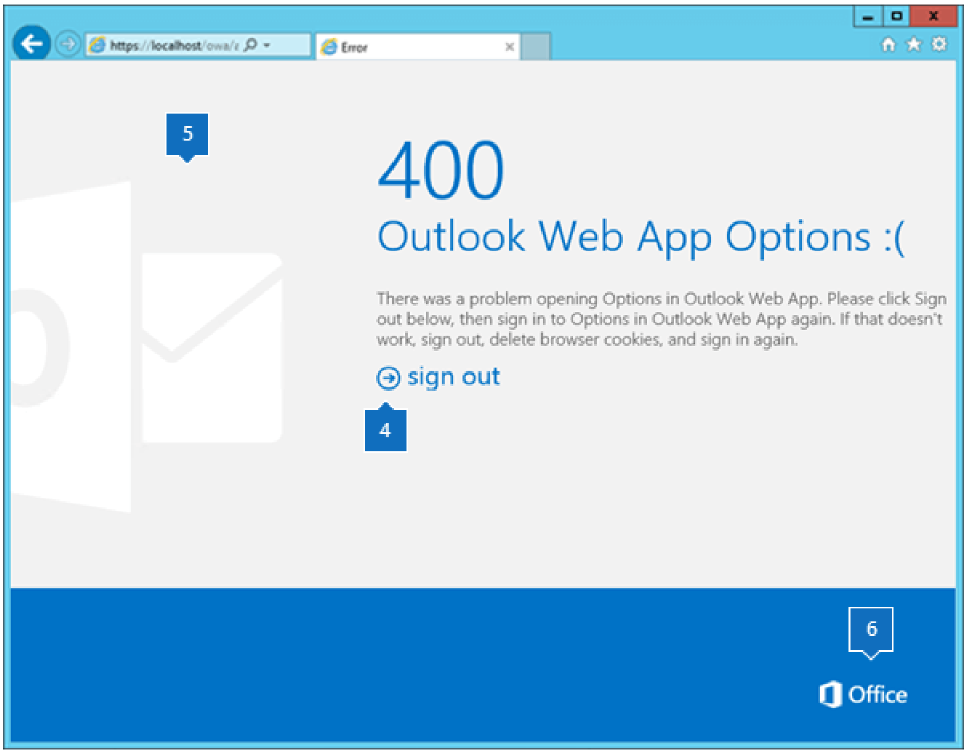


Customize the color of the Outlook on the web error page

1. Use Notepad to open the file `%ExchangeInstallPath%FrontEnd\HttpProxy\owa\auth\<ExchangeVersion>\themes\resources\errorFE.css` .

2. In the `errorFE.css` file, replace the default blue color value #0072c6 with the HTML RGB value that you want to use.

3. When you're finished, save and close the file.



400

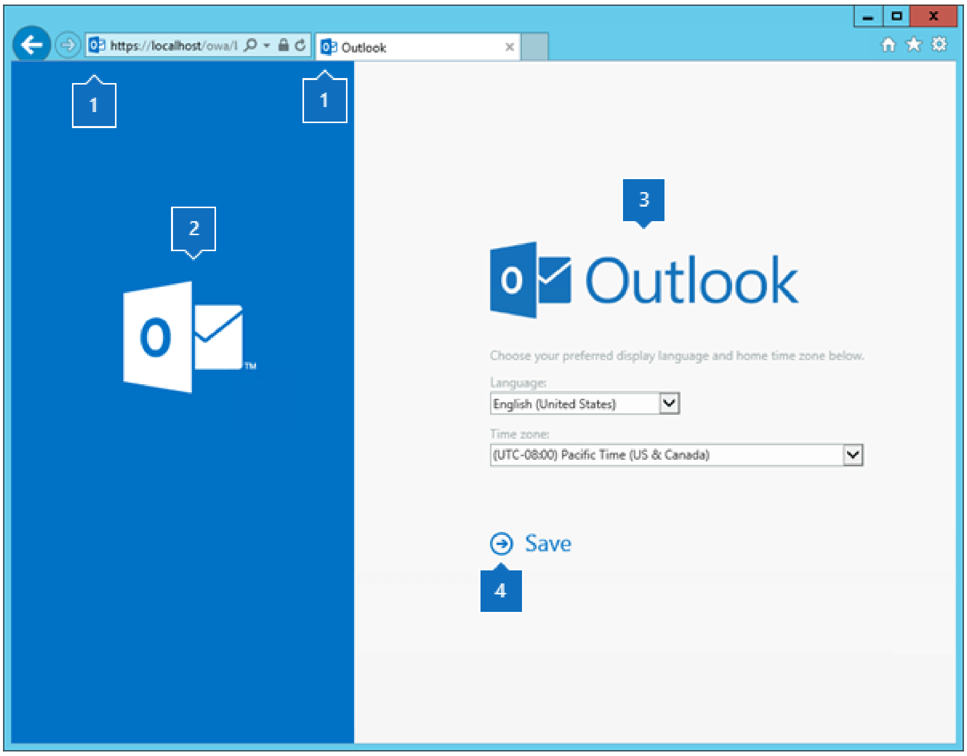
Outlook Web App Options :(

There was a problem opening Options in Outlook Web App. Please click Sign out below, then sign in to Options in Outlook Web App again. If that doesn't work, sign out, delete browser cookies, and sign in again.

sign out

Customize the color of the Outlook on the web language selection page

1. Use Notepad to open the file `%ExchangeInstallPath%ClientAccess\Owa\prem\<ExchangeVersion>\resources\styles\languageselection.css`.
2. In the `languageselection.css` file, replace the default blue color value #0072c6 with the HTML RGB value that you want to use.
3. When you're finished, save and close the file.



Choose your preferred display language and home time zone below.

Language:
English (United States)

Time zone:
(UTC-08:00) Pacific Time (US & Canada)

Save

Customize the images on the Outlook on the web sign-in, language selection, and error pages

You can edit the existing image files, or replace the files with new files that have the same names and dimensions. The images are described in the following table:

IMAGE	FILE NAME	LOCATION	DIMENSIONS (WIDTH X HEIGHT IN PIXELS)	BIT DEPTH
1	favicon.ico	`%ExchangeInstallPath%FrontEnd\HttpProxy\owa\auth\<ExchangeVersion>\themes\resources`	16 x 16	32
2	olk_logo_white.png	`%ExchangeInstallPath%ClientAccess\Owa\prem\<ExchangeVersion>\resources\images\0`	128 x 108	32
3	owa_text_blue.png	`%ExchangeInstallPath%ClientAccess\Owa\prem\<ExchangeVersion>\resources\images\0`	300 x 76	32

IMAGE	FILE NAME	LOCATION	DIMENSIONS (WIDTH X HEIGHT IN PIXELS)	BIT DEPTH
4	Sign_in_arrow.png (for left-to-right languages) Sign_in_arrow_rtl.png (for right-to-left languages)	`%ExchangeInstallPath%FrontEnd\HttpProxy\owa\auth\<ExchangeVersion>\themes\resources`	22 x 22	32
5	olk_logo_white_cropped.png	`%ExchangeInstallPath%FrontEnd\HttpProxy\owa\auth\<ExchangeVersion>\themes\resources`	265 x 310	32
6	office_logo_white_small.png	`%ExchangeInstallPath%ClientAccess\Owa\prem\<ExchangeVersion>\resources\images\0` (for left-to-right languages) `%ExchangeInstallPath%ClientAccess\Owa\prem\<ExchangeVersion>\resources\images\rtl` (for right-to-left languages)	81 x 26	8

How do you know this worked?

To verify that you've successfully customized the Outlook on the web sign-in, language selection, and error pages, perform the following steps:

1. Open the Outlook on the web sign-in page in a web browser. On the Exchange server that hosts the Outlook on the web virtual directory, you can test your changes by opening the URL https://localhost/owa or https://127.0.0.1/owa.

2. If you don't see your changes, clear your browsing history (delete temporary Internet files), and refresh the browser window.

   Note: To see the effects of your changes, you can keep the .css file open and refresh the browser window after you save each change.

Use AD FS claims-based authentication with Outlook on the web

8/3/2020 • 31 minutes to read • Edit Online

Installing and configuring Active Directory Federation Services (AD FS) in Exchange Server organizations allows clients to use AD FS claims-based authentication to connect to Outlook on the web (formerly known as Outlook Web App) and the Exchange admin center (EAC). Claims-based identity is another approach to authentication that removes authentication management from the application, and makes it easier for you to manage accounts by centralizing authentication. When claims-based authentication is enabled, Outlook on the web and the EAC aren't responsible for authenticating users, storing user accounts and passwords, looking up user identity details, or integrating with other identity systems. Centralizing authentication helps make it easier to upgrade authentication methods in the future.

AD FS claims-based authentication replaces the traditional authentication methods that are available for Outlook on the web and the EAC. For example:

- Active Directory client certificate authentication
- Basic authentication
- Digest authentication
- Forms authentication
- Windows authentication

Setting up AD FS claims-based authentication for Outlook on the web and the EAC in Exchange Server involves the following additional servers:

- A Windows Server 2012 or later domain controller (Active Directory Domain Services server role).
- A Windows Server 2012 or later AD FS server (Active Directory Federation Services server role). Windows Server 2012 uses AD FS 2.1, and Windows Server 2012 R2 uses AD FS 3.0. You need to be a member of the Domain Admins, Enterprise Admins, or local Administrators security group to install AD FS, and to create the required relying party trusts and claim rules on the AD FS server.
- Optionally, a Windows Server 2012 R2 or later Web Application Proxy server (Remote Access server role, Web Application Proxy role service).
  - Web Application Proxy is a reverse proxy server for web applications that are inside the corporate network. Web Application Proxy allows users on many devices to access published web applications from outside the corporate network. For more information, see Installing and Configuring Web Application Proxy for Publishing Internal Applications.
  - Although Web Application Proxy is typically recommended when AD FS is accessible to external clients, offline access in Outlook on the web isn't supported when using AD FS authentication through Web Application Proxy.
  - Installing Web Application Proxy on a Windows Server 2012 R2 server requires local administrator permissions.
  - You need to deploy and configure the AD FS server before you configure the Web Application Proxy server, and you can't install Web Application Proxy on the same server where AD FS is installed.

What do you need to know before you begin?

- Estimated time to complete this procedure: 45 minutes.
- The procedures in this topic are based on Windows Server 2012 R2.
- Outlook on the web for devices doesn't support AD FS claims-based authentication.
- For the procedures in the Exchange organization, you need to have Organization Management permissions.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

> **TIP**
>
> Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Step 1: Review the certificate requirements for AD FS

AD FS requires two basic types of certificates:

- A service communication Secure Sockets Layer (SSL) certificate for encrypted web services traffic between the AD FS server, clients, Exchange servers, and the optional Web Application Proxy server. We recommend that you use a certificate that's issued by an internal or commercial certification authority (CA), because all clients need to trust this certificate.
- A token-signing certificate for encrypted communication and authentication between the AD FS server, Active Directory domain controllers, and Exchange servers. We recommend that you use the default self-signed AD FS token signing certificate.

For more information about creating and importing SSL certificates in Windows, see Server Certificates.

Here's a summary of the certificates that we'll be using in this scenario:

COMMON NAME (CN) IN THE CERTIFICATE (IN THE SUBJECT, SUBJECT ALTERNATIVE NAME, OR A WILDCARD CERTIFICATE MATCH)	TYPE	REQUIRED ON SERVERS	COMMENTS
`adfs.contoso.com`	Issued by a CA	AD FS server Web Application Proxy server	This is the host name that's visible to clients, so clients need to trust the issuer of this certificate.

COMMON NAME (CN) IN THE CERTIFICATE (IN THE SUBJECT, SUBJECT ALTERNATIVE NAME, OR A WILDCARD CERTIFICATE MATCH)	TYPE	REQUIRED ON SERVERS	COMMENTS
`ADFS Signing - adfs.contoso.com`	Self-signed	AD FS server Exchange servers Web Application Proxy server	The default self-signed certificate is automatically copied over during the configuration of the optional Web Application Proxy server, but you'll need to manually import it into the Trusted Root Certificate store on all Exchange servers in your organization. By default, the self-signed token-signing certificates are valid for one year. The AD FS server is configured to automatically renew (replace) its self-signed certificates before they expire, but you'll need to re-import the certificate on the Exchange servers. You can increase the default certificate expiration period by running this command in Windows PowerShell on the AD FS server: `Set-AdfsProperties -CertificateDuration <Days>` (the default value is 365). For more information, see Set-AdfsProperties. To export the certificate from the AD FS Management console, select **Service** > **Certificates** > right-click on the token-signing certificate > select **View Certificate** > click the **Details** tab > click **Copy to File**.
`mail.contoso.com`	Issued by a CA	Exchange servers Web Application Proxy server	This is the typical certificate that's used to encrypt external client connections to Outlook on the web (and likely other Exchange IIS services). For more information, see Certificate requirements for Exchange services.

For more information, see the "Certificate requirements" section in AD FS Requirements.

NOTE

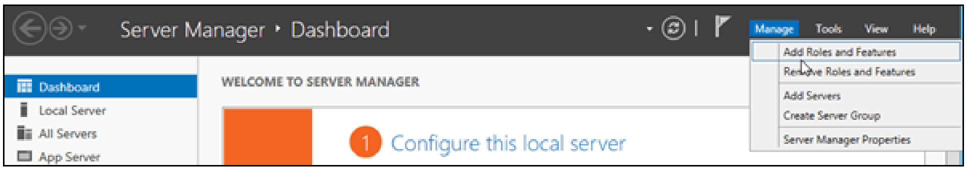
Secure Sockets Layer (SSL) is being replaced by Transport Layer Security (TLS) as the protocol that's used to encrypt data sent between computer systems. They're so closely related that the terms "SSL" and "TLS" (without versions) are often used interchangeably. Because of this similarity, references to "SSL" in Exchange topics, the Exchange admin center, and the Exchange Management Shell have often been used to encompass both the SSL and TLS protocols. Typically, "SSL" refers to the actual SSL protocol only when a version is also provided (for example, SSL 3.0). To find out why you should disable the SSL protocol and switch to TLS, check out Protecting you against the SSL 3.0 vulnerability.

Step 2: Deploy an AD FS server

You can use Server Manager or Windows PowerShell to install the Active Directory Federation Services role service on the target server.

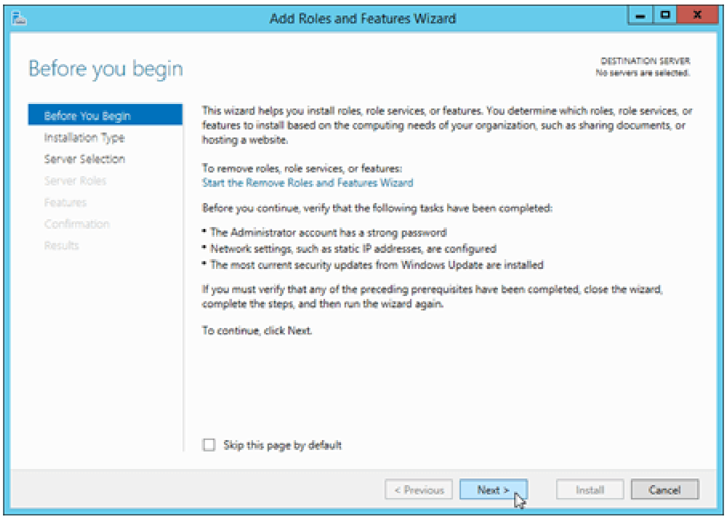
To use Server Manager to install AD FS, follow these steps:

1. On the target server, open **Server Manager**, click **Manage**, and then select **Add Roles and Features**.



Server Manager • Dashboard
Manage
Tools
View
Help
Add Roles and Features
Remove Roles and Features
Add Servers
Create Server Group
Server Manager Properties
Dashboard
Local Server
All Servers
App Server
WELCOME TO SERVER MANAGER
1
Configure this local server

2. The **Add Roles and Features Wizard** opens. You'll start on the **Before you begin** page unless you previously selected **Skip this page by default**. Click **Next**.



This wizard helps you install roles, role services, or features. You determine which roles, role services, or features to install based on the computing needs of your organization, such as sharing documents, or hosting a website.

To remove roles, role services, or features:
Start the Remove Roles and Features Wizard

Before you continue, verify that the following tasks have been completed:

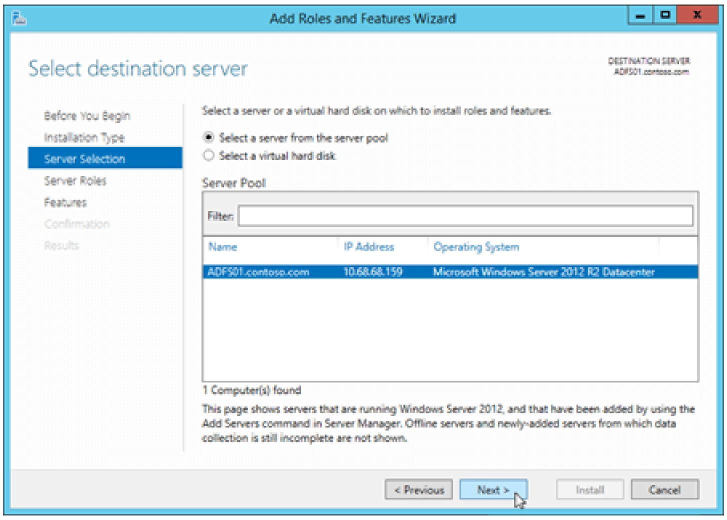
- The Administrator account has a strong password
- Network settings, such as static IP addresses, are configured
- The most current security updates from Windows Update are installed

If you must verify that any of the preceding prerequisites have been completed, close the wizard, complete the steps, and then run the wizard again.

To continue, click Next.

□ Skip this page by default

3. On the **Select installation type** page, verify that **Role-based or feature-based installation** is selected, and then click **Next**.



Select destination server

DESTINATION SERVER
ADFS01.contoso.com

Select a server or a virtual hard disk on which to install roles and features.

● Select a server from the server pool
○ Select a virtual hard disk

This page shows servers that are running Windows Server 2012, and that have been added by using the Add Servers command in Server Manager. Offline servers and newly-added servers from which data collection is still incomplete are not shown.

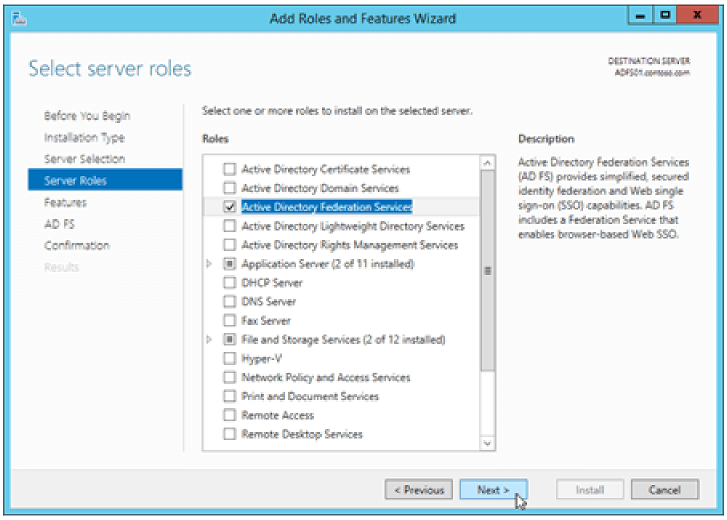
5. On the **Select server roles** page, select **Active Directory Federation Services** from the list, and then click **Next**.



Select server roles

DESTINATION SERVER
ADFS01.contoso.com

Select one or more roles to install on the selected server.

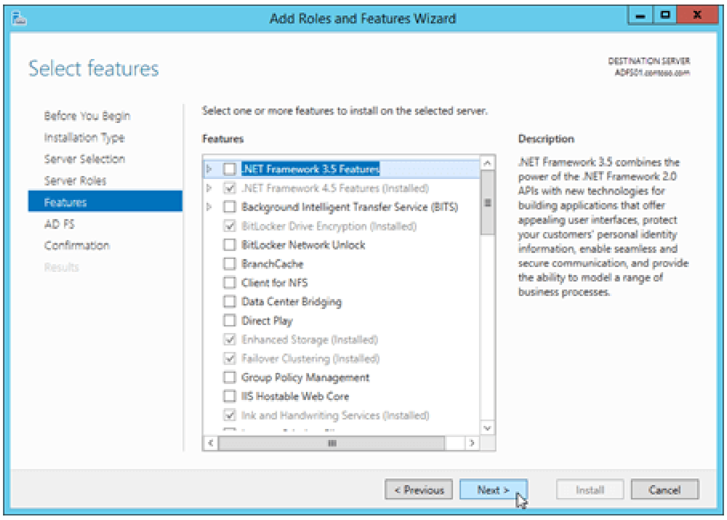
Roles

- □ Active Directory Certificate Services
- □ Active Directory Domain Services
- ☑ Active Directory Federation Services
- □ Active Directory Lightweight Directory Services
- □ Active Directory Rights Management Services
- ▨ Application Server (2 of 11 installed)
- □ DHCP Server
- □ DNS Server
- □ Fax Server
- ▨ File and Storage Services (2 of 12 installed)
- □ Hyper-V
- □ Network Policy and Access Services
- □ Print and Document Services
- □ Remote Access
- □ Remote Desktop Services

Description

Active Directory Federation Services (AD FS) provides simplified, secured identity federation and Web single sign-on (SSO) capabilities. AD FS includes a Federation Service that enables browser-based Web SSO.

6. On the **Select features** page, click **Next** (accept the default feature selections).



Select features

Select one or more features to install on the selected server.

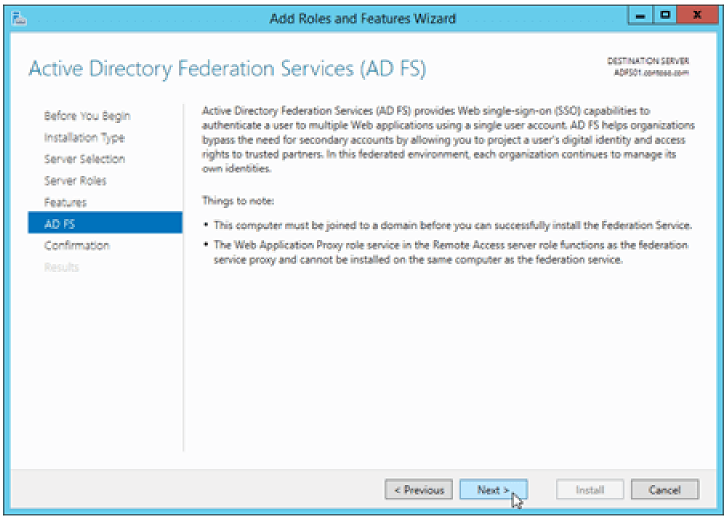
Features

- ☐ .NET Framework 3.5 Features
- ☑ .NET Framework 4.5 Features (Installed)
- ☐ Background Intelligent Transfer Service (BITS)
- ☑ BitLocker Drive Encryption (Installed)
- ☐ BitLocker Network Unlock
- ☐ BranchCache
- ☐ Client for NFS
- ☐ Data Center Bridging
- ☐ Direct Play
- ☑ Enhanced Storage (Installed)
- ☑ Failover Clustering (Installed)
- ☐ Group Policy Management
- ☐ IIS Hostable Web Core
- ☑ Ink and Handwriting Services (Installed)

Description

.NET Framework 3.5 combines the power of the .NET Framework 2.0 APIs with new technologies for building applications that offer appealing user interfaces, protect your customers' personal identity information, enable seamless and secure communication, and provide the ability to model a range of business processes.

7. On the **Active Directory Federation Services (AD FS)** page, click **Next**.



Active Directory Federation Services (AD FS)

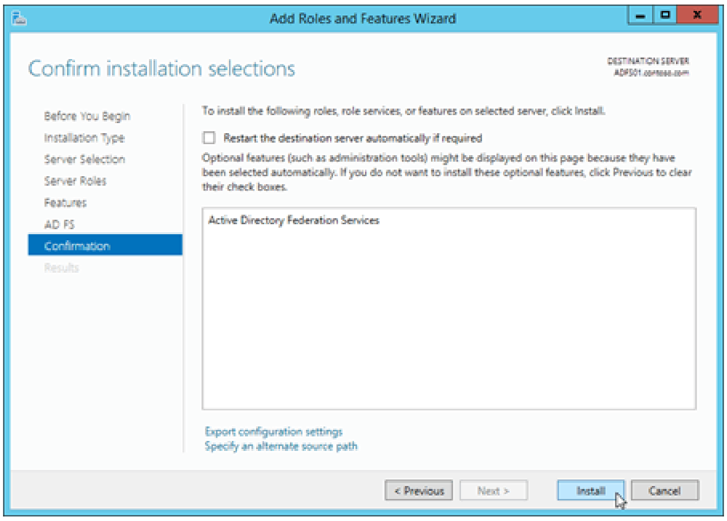
Active Directory Federation Services (AD FS) provides Web single-sign-on (SSO) capabilities to authenticate a user to multiple Web applications using a single user account. AD FS helps organizations bypass the need for secondary accounts by allowing you to project a user's digital identity and access rights to trusted partners. In this federated environment, each organization continues to manage its own identities.

Things to note:

- This computer must be joined to a domain before you can successfully install the Federation Service.
- The Web Application Proxy role service in the Remote Access server role functions as the federation service proxy and cannot be installed on the same computer as the federation service.

8. **Windows Server 2012 only**: On the **Select role services** page, click **Next** (accept the default role service selections).

9. On the **Confirm installation selections** page, click **Install**.



Confirm installation selections

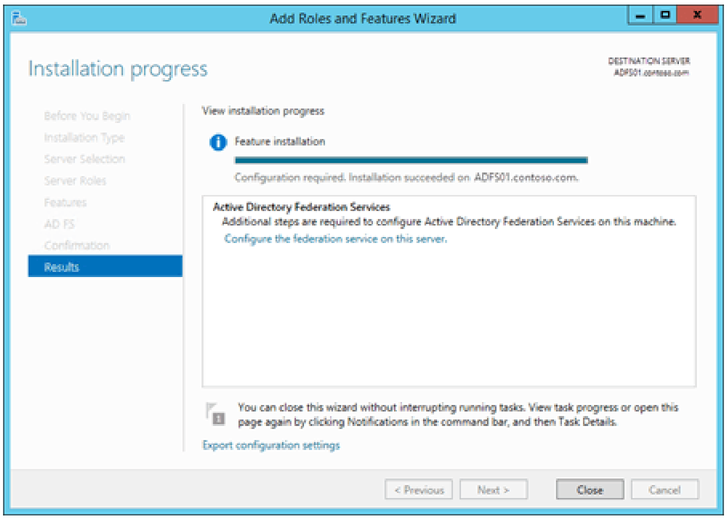
To install the following roles, role services, or features on selected server, click Install.

☐ Restart the destination server automatically if required

Optional features (such as administration tools) might be displayed on this page because they have been selected automatically. If you do not want to install these optional features, click Previous to clear their check boxes.

Active Directory Federation Services

10. On the **Installation progress** page, you can watch the progress bar to verify that the installation was successful. When the installation is finished, leave the wizard open so you can click **Configure the federation service on this server** in Step 3b: Configure the AD FS server.



Configuration required. Installation succeeded on ADFS01.contoso.com.

Active Directory Federation Services

Additional steps are required to configure Active Directory Federation Services on this machine.

Configure the federation service on this server.

You can close this wizard without interrupting running tasks. View task progress or open this page again by clicking Notifications in the command bar, and then Task Details.

Export configuration settings

To use Windows PowerShell to install AD FS, run the following command:

```
Install-WindowsFeature ADFS-Federation -IncludeManagementTools
```

Step 3: Configure and test the AD FS server

You can also refer to this checklist to help you configure AD FS: Checklist: Setting Up a Federation Server.

Step 3a: Create a gMSA on a domain controller

Before you configure the AD FS server, you need to create a group Managed Service Account (gMSA) on a Windows Server 2012 or later domain controller. You do this in an elevated Windows PowerShell window on the domain controller (a Windows PowerShell window you open by selecting **Run as administrator**).

1. Run the following command:

   ```
   Add-KdsRootKey -EffectiveTime (Get-Date).AddHours(-10)
   ```

   If the command is successful, a GUID value is returned. For example:

   > Guid
   > ----
   > 2570034b-ab50-461d-eb80-04e73ecf142b

2. To create a new gMSA account for the AD FS server, use the following syntax:

   ```
   New-ADServiceAccount -Name <AccountName> -DnsHostName <FederationServiceName> -ServicePrincipalNames
   http/<FederationServiceName>
   ```

   This example creates a new gMSA account named FSgMSA for the Federation Service named adfs.contoso.com. The Federation Service name is the value that's visible to clients.

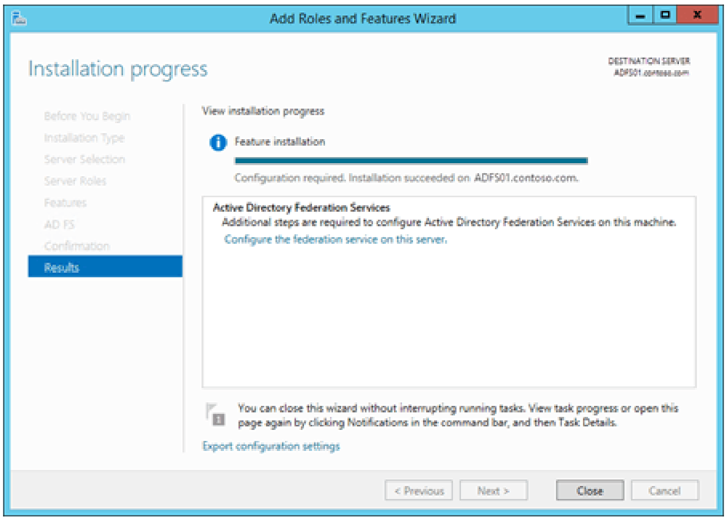
   ```
   New-ADServiceAccount -Name FSgMSA -DnsHostName adfs.contoso.com -ServicePrincipalNames
   http/adfs.contoso.com
   ```

Step 3b: Configure the AD FS server

To configure the AD FS server, you can use Server Manager or Windows PowerShell.

To use Server Manager, following these steps:

1. If you left the **Add Roles and Features Wizard** open on the AD FS server from Step 2: Deploy an AD FS server, you can click the **Configure the federation service on this server** link on the **Installation progress** page.



Add Roles and Features Wizard

Configuration required for Active Directory Federation Services at ADFS01

Configure the federation service on this server.

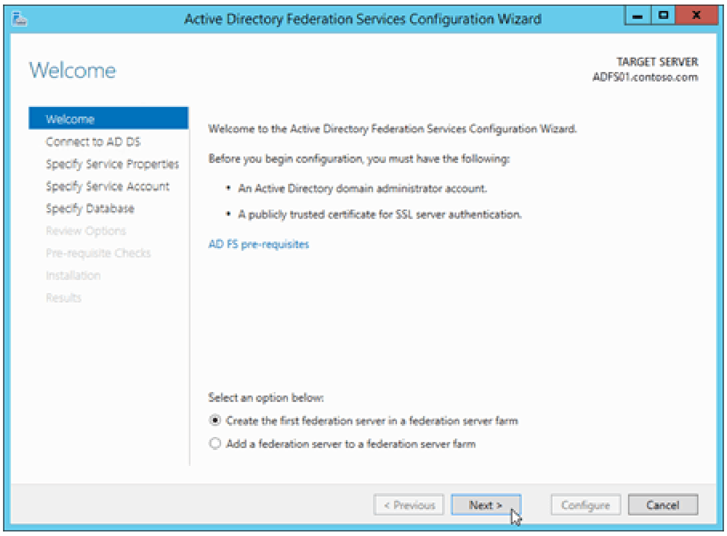
Feature installation

Configuration required. Installation succeeded on ADFS01.contoso.com.

Add Roles and Features

Task Details

2. The **Active Directory Federation Services Wizard** opens. On the **Welcome** page, verify **Create the first federation server in a federation server farm** is selected, and then click **Next**.



Active Directory Federation Services Configuration Wizard

Welcome

TARGET SERVER
ADFS01.contoso.com

Welcome to the Active Directory Federation Services Configuration Wizard.

Before you begin configuration, you must have the following:

- An Active Directory domain administrator account.
- A publicly trusted certificate for SSL server authentication.

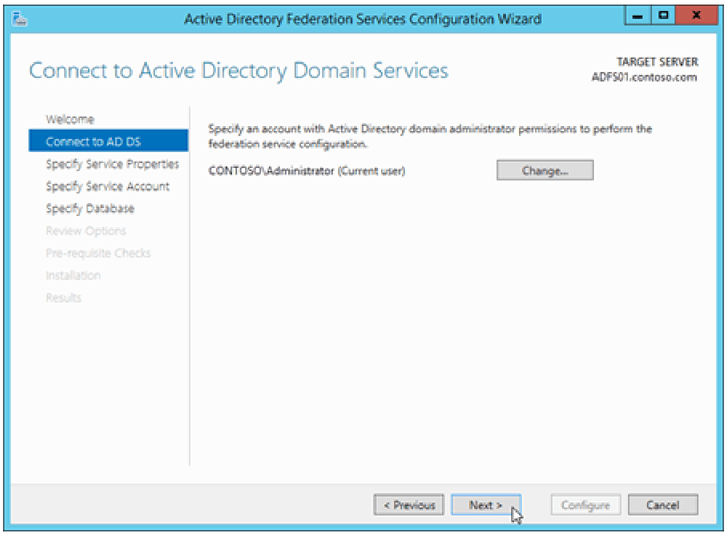
AD FS pre-requisites

Select an option below:

● Create the first federation server in a federation server farm

○ Add a federation server to a federation server farm

3. On the **Connect to Active Directory Federation Services** page, select a domain administrator account in the domain where the AD FS server resides (your current credentials are selected by default). If you need to select a different user, click **Change**. When you're finished, click **Next**.



Active Directory Federation Services Configuration Wizard

Connect to Active Directory Domain Services

TARGET SERVER
ADFS01.contoso.com

Specify an account with Active Directory domain administrator permissions to perform the federation service configuration.

CONTOSO\Administrator (Current user)

4. On the **Specify Service Properties** page, configure the following settings:

   - **SSL Certificate**: Import or select the SSL certificate that contains the federation service name that you configured in Step 3a: Create a gMSA on a domain controller (for example `adfs.contoso.com`). When you import a certificate that isn't already installed on the server, you need to import a .pfx file (likely, a password-protected file that contains the certificate's private key). The common name (CN) value in the certificate's Subject field is displayed here.

   - **Federation Service Name**: This field is automatically populated based on the type of SSL certificate that you select or import:

     - **Single subject certificate**: The CN value of the certificate's Subject field is displayed, and you can't change it (for example, `adfs.contoso.com`).

     - **SAN certificate**: If the certificate contains the required federation service name, that value is displayed (for example, `adfs.contoso.com`). You can use the drop down list to see other CN values in the certificate.

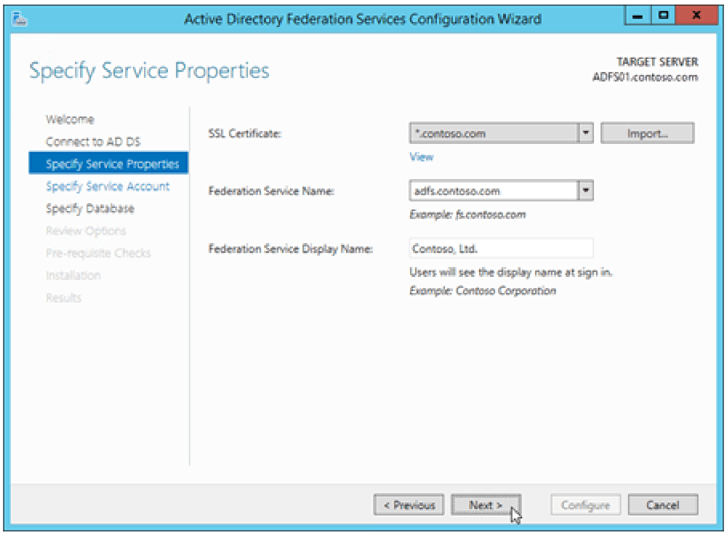
     - **Wildcard certificate**: The CN value of the certificate's Subject field is displayed (for example, `*.contoso.com`), but you need to change it to the required federation service name (for example, `adfs.contoso.com`).

     Note: If the certificate you select doesn't contain the required federation service name (the **Federation Service Name** field doesn't contain the required value), you'll receive the following error:

     ```
     The federation service name does not match any of the subject names found in the certificate.
     ```

   - **Federation Service Display Name**: Enter the name of your organization. For example, Contoso, Ltd..

   When you're finished, click **Next**.



Specify Service Properties

TARGET SERVER
ADFS01.contoso.com

SSL Certificate: *.contoso.com

Federation Service Name: adfs.contoso.com

Example: fs.contoso.com

Federation Service Display Name: Contoso, Ltd.

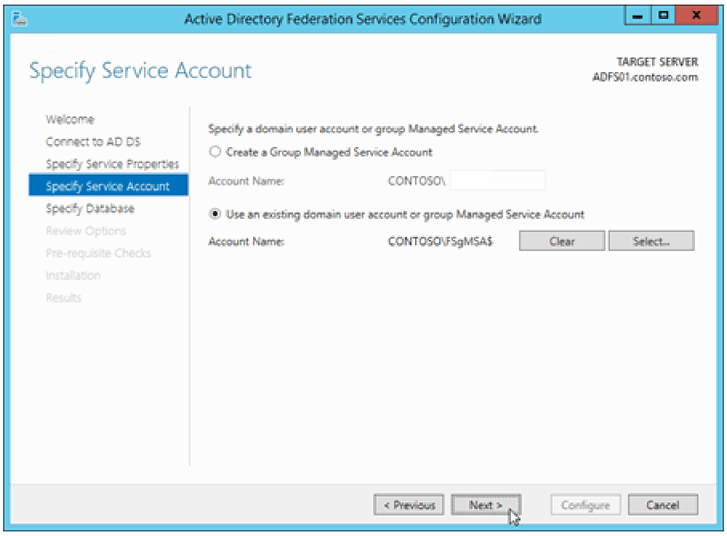
Users will see the display name at sign in.

Example: Contoso Corporation

5. On the **Specify Service Account** page, configure the following settings:

   - Select **Use an existing domain user account or group Managed Service Account**.
   - **Account Name**: Click **Select** and enter the gMSA account that you created in Step 3a: Create a gMSA on a domain controller (for example, `FSgMSA`). Note that after you select it, the value that's displayed is `<Domain>\<gMSAAccountName>$` (for example, `CONTOSO\FSgMSA$`).

   When you're finished, click **Next**.



Specify Service Account

TARGET SERVER
ADFS01.contoso.com

Specify a domain user account or group Managed Service Account.

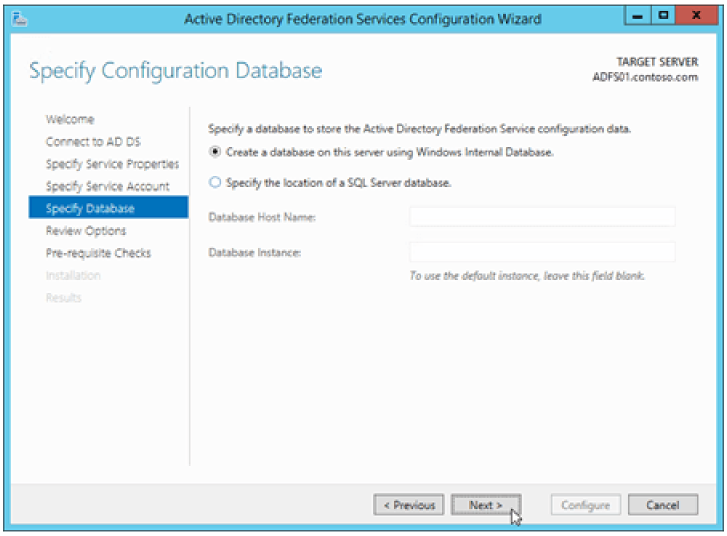
○ Create a Group Managed Service Account

Account Name: CONTOSO\

● Use an existing domain user account or group Managed Service Account

Account Name: CONTOSO\FSgMSA$

6. On the **Specify Configuration Database** page, verify that **Create a database on this server using Windows Internal Database** is selected, and then click **Next**.



Specify Configuration Database

TARGET SERVER
ADFS01.contoso.com

Specify a database to store the Active Directory Federation Service configuration data.

● Create a database on this server using Windows Internal Database.

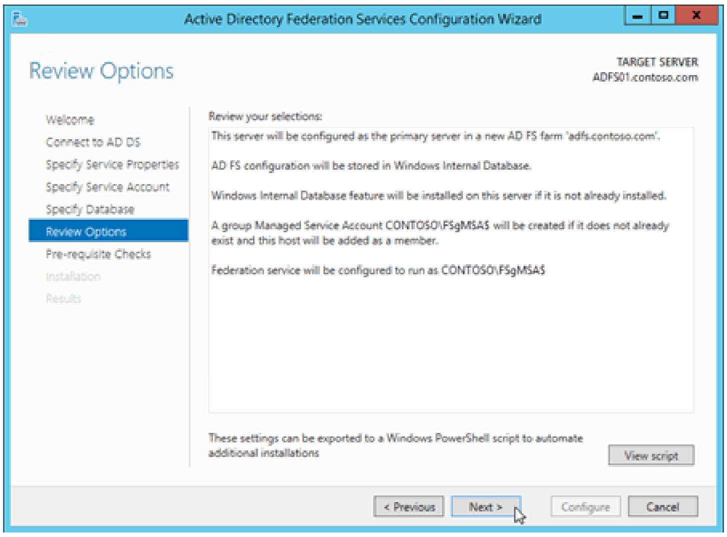
○ Specify the location of a SQL Server database.

Database Host Name:

Database Instance:

To use the default instance, leave this field blank.

7. On the **Review Options** page, verify your selections. You can click **View Script** button to copy the Windows PowerShell equivalent of the selections that you made for future use. When you're finished, click **Next**.



Active Directory Federation Services Configuration Wizard

Review Options

TARGET SERVER
ADFS01.contoso.com

Review your selections:

This server will be configured as the primary server in a new AD FS farm 'adfs.contoso.com'.

AD FS configuration will be stored in Windows Internal Database.

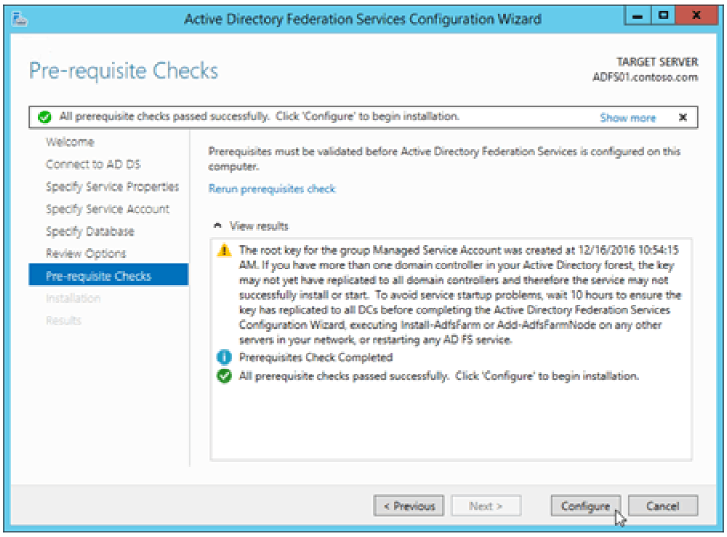
Windows Internal Database feature will be installed on this server if it is not already installed.

A group Managed Service Account CONTOSO\FSgMSA$ will be created if it does not already exist and this host will be added as a member.

Federation service will be configured to run as CONTOSO\FSgMSA$

These settings can be exported to a Windows PowerShell script to automate additional installations

8. On the **Pre-requisite Checks** page, verify that all the prerequisite checks were successfully completed, and then click **Configure**.



Active Directory Federation Services Configuration Wizard

Pre-requisite Checks

TARGET SERVER
ADFS01.contoso.com

✓ All prerequisite checks passed successfully. Click 'Configure' to begin installation.

Prerequisites must be validated before Active Directory Federation Services is configured on this computer.

Rerun prerequisites check

View results

⚠ The root key for the group Managed Service Account was created at 12/16/2016 10:54:15 AM. If you have more than one domain controller in your Active Directory forest, the key may not yet have replicated to all domain controllers and therefore the service may not successfully install or start. To avoid service startup problems, wait 10 hours to ensure the key has replicated to all DCs before completing the Active Directory Federation Services Configuration Wizard, executing Install-AdfsFarm or Add-AdfsFarmNode on any other servers in your network, or restarting any AD FS service.

ℹ Prerequisites Check Completed

✓ All prerequisite checks passed successfully. Click 'Configure' to begin installation.

9. On the **Results** page, review the results, verify that the configuration completed successfully. You can click **Next steps required for completing your federation service deployment** if you want to read about the next steps (for example, configuring DNS). When you're finished, click **Close**.

⚠ The root key for the group Managed Service Account was created at 12/16/2016 10:54:15 AM. If you have more than one domain controller in your Active Directory forest, the key may not yet have replicated to all domain controllers and therefore the service may not successfully install or start. To avoid service startup problems, wait 10 hours to ensure the key has replicated to all DCs before completing the Active Directory Federation Services Configuration Wizard, executing Install-AdfsFarm or Add-AdfsFarmNode on any other servers in your network, or restarting any AD FS service.

Next steps required for completing your federation service deployment

To use Windows PowerShell to configure AD FS, follow these steps:

1. Run the following command on the AD FS server to find the thumbprint value of the installed certificate that contains `adfs.contoso.com`:

   ```
   Set-Location Cert:\LocalMachine\My; Get-ChildItem | Format-List FriendlyName,Subject,Thumbprint
   ```

2. Run the following command:

   ```
   Import-Module ADFS
   ```

3. Use the following syntax:

   ```
   Install-AdfsFarm -CertificateThumbprint <ThumbprintValue> -FederationServiceName <FederationServiceName>
   -FederationServiceDisplayName <FederationServiceDisplayName> -GroupServiceAccountIdentifier <gMSA>
   ```

This example configures AD FS with the following settings:

- **adfs.contoso.com certificate thumbprint**: The `*.contoso.com` certificate that has the thumbprint value `5AE82C737900B29C2BAC3AB6D8C44D249EE05609`.

- **Federation service name**: `adfs.contoso.com`

- **Federation service display name**: `Contoso, Ltd.`

- **Federation gMSA SAM account name and domain**: For example, for the gMSA account named `FSgMSA` in the `contoso.com` domain, the required value is `contoso\FSgMSA$`.

```
Install-AdfsFarm -CertificateThumbprint 5AE82C737900B29C2BAC3AB6D8C44D249EE05609 -FederationServiceName
adfs.contoso.com -FederationServiceDisplayName "Contoso, Ltd." -GroupServiceAccountIdentifier
"contoso\FSgMSA`$"
```

Notes:

- When you create the gMSA, the `$` is automatically appended to the **Name** value to create the **SamAccountName** value, which is required here.

- The escape character (``) is required for the `$` in the **SamAccountName**.

For details and syntax, see Install-AdfsFarm.

Step 3c: Test the AD FS server

After you configure AD FS, you can verify the installation on the AD FS server by successfully opening the URL of the federation metadata in a web browser. The URL uses the syntax `https://<FederationServiceName>/federationmetadata/2007-06/federationmetadata.xml`. For example, `https://adfs.contoso.com/federationmetadata/2007-06/federationmetadata.xml`.

Step 4: Create a relying party trust and custom claim rules in AD FS for Outlook on the web and the EAC

- On the Exchange server, Outlook on the web uses the virtual directory named `owa` and the EAC uses the virtual directory named `ecp`.

- The trailing slash (`/`) that's used in the Outlook on the web and EAC URL values is intentional. It's important that the AD FS relying party trusts and Exchange Audience URI's **are identical**. They **both must have** or **both must omit** the trailing slashes in their URLs. The examples in this section contain the trailing slashes after the owa and ecp URLs (`owa/` and `ecp/`).

- In organizations with multiple Active Directory sites that use separate namespaces (for example, `eu.contoso.com` and `na.contoso.com`), you need to configure relying party trusts for each namespace for both Outlook on the web and the EAC.

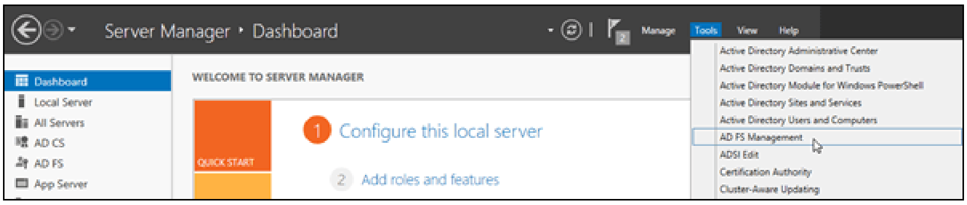
Step 4a: Create relying party trusts in AD FS for Outlook on the web and the EAC

To create the relying party trusts on the AD FS server, you can use the AD FS Management console or Windows PowerShell.

To use the AD FS Management console to create the relying party trusts, follow these steps:

Note: You need to go through these steps twice: once for Outlook on the web, and once for the EAC. The only difference is the values that you enter in steps 5 and 8 (the **Specify Display Name** and **Configure URL** pages in the wizard).

1. In **Server Manager**, click **Tools**, and then select **AD FS Management**.



Server Manager • Dashboard

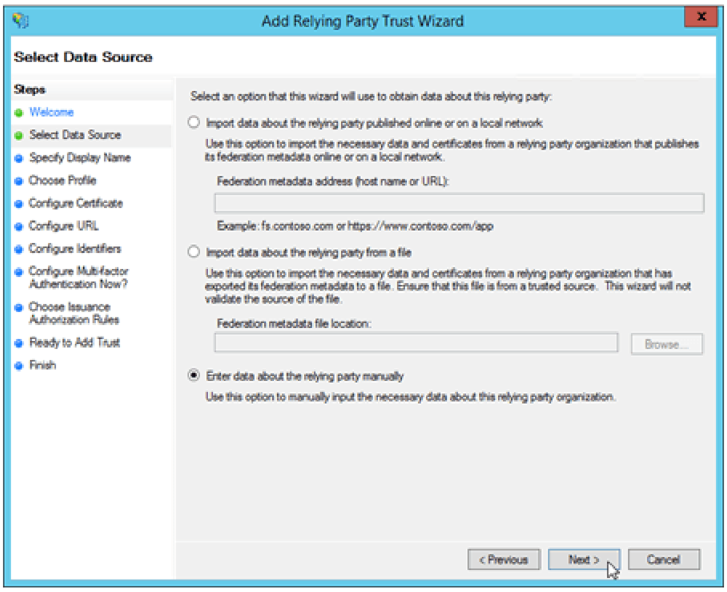
Welcome to the Add Relying Party Trust Wizard

This wizard will help you add a new relying party trust to the AD FS configuration database. Relying parties consume claims in security tokens that are issued by this Federation Service to make authentication and authorization decisions.

The relying party trust that this wizard creates defines how this Federation Service recognizes the relying party and issues claims to it. You can define issuance transform rules for issuing claims to the relying party after you complete the wizard.

4. On the **Select Data Source** page, select **Enter data about the relying party manually**, and then click

Next.



Select Data Source

Select an option that this wizard will use to obtain data about this relying party:

○ Import data about the relying party published online or on a local network

Use this option to import the necessary data and certificates from a relying party organization that publishes its federation metadata online or on a local network.
